        const data = await snsClient.send(new SubscribeCommand(params));
        console.log("Success.", data);
        return data; // For unit tests.
    } catch (err) {
        console.log("Error", err.stack);
    }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [Subscribe](#) in [AWS SDK for JavaScript API Reference](#).

## Subscribe an email address to a topic

The following code example shows how to subscribe an email address to an Amazon SNS topic.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { SNSClient } from "@aws-sdk/client-sns";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SNS service object.
const snsClient = new SNSClient({ region: REGION });
export { snsClient };
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import {SubscribeCommand } from "@aws-sdk/client-sns";
import {snsClient } from "./libs/snsClient.js";

// Set the parameters
const params = {
  Protocol: "email" /* required */,
  TopicArn: "TOPIC_ARN", //TOPIC_ARN
  Endpoint: "EMAIL_ADDRESS", //EMAIL_ADDRESS
};

const run = async () => {
  try {
    const data = await snsClient.send(new SubscribeCommand(params));
    console.log("Success.", data);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err.stack);
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [Subscribe](#) in [AWS SDK for JavaScript API Reference](#).

## Amazon SQS examples using SDK for JavaScript V3

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for JavaScript V3 with Amazon Simple Queue Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3128\)](#)

## Actions

### Change how long a queue waits for a message

The following code example shows how to change how long an Amazon SQS queue waits for a message to arrive.

#### SDK for JavaScript V3

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { SQSClient } from "@aws-sdk/client-sqs";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SQS service object.
const sqsClient = new SQSClient({ region: REGION });
export { sqsClient };
```

Change how long an Amazon SQS queue waits for a message to arrive.

```
// Import required AWS SDK clients and commands for Node.js
import { SetQueueAttributesCommand } from "@aws-sdk/client-sqs";
import { sqsClient } from "./libs/sqsClient.js";

// Set the parameters
const params = {
  Attributes: {
    ReceiveMessageWaitTimeSeconds: "20",
  },
  QueueUrl: "SQS_QUEUE_URL", //SQS_QUEUE_URL; e.g., 'https://sqs.REGION.amazonaws.com/ACCOUNT-ID/QUEUE-NAME'
};

const run = async () => {
  try {
    const data = await sqsClient.send(new SetQueueAttributesCommand(params));
    console.log("Success", data);
    return data; // For unit tests.
  } catch (err) {
    console.error(err, err.stack);
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [SetQueueAttributes](#) in [AWS SDK for JavaScript API Reference](#).

#### SDK for JavaScript V2

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Change how long an Amazon SQS queue waits for a message to arrive.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create the SQS service object
var sqs = new AWS.SQS({apiVersion: '2012-11-05'});

var params = {
  Attributes: {
    "ReceiveMessageWaitTimeSeconds": "20",
  },
  QueueUrl: "SQS_QUEUE_URL"
};

sqs.setQueueAttributes(params, function(err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data);
  }
});
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [SetQueueAttributes](#) in [AWS SDK for JavaScript API Reference](#).

### Change message timeout visibility

The following code example shows how to change an Amazon SQS message timeout visibility.

#### SDK for JavaScript V3

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { SQSClient } from "@aws-sdk/client-sqs";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SQS service object.
const sqsClient = new SQSClient({ region: REGION });
export { sqsClient };
```

Receive an Amazon SQS message and change its timeout visibility.

```
// Import required AWS SDK clients and commands for Node.js
import {
  ReceiveMessageCommand,
  ChangeMessageVisibilityCommand,
} from "@aws-sdk/client-sqs";
import { sqsClient } from "./libs/sqsClient.js";

// Set the parameters
const queueURL = "https://sqs.REGION.amazonaws.com/ACCOUNT-ID/QUEUE-NAME"; // REGION,
  ACCOUNT_ID, QUEUE_NAME
const params = {
  AttributeNames: ["SentTimestamp"],
```

```
    MaxNumberOfMessages: 1,
    MessageAttributeNames: ["All"],
    QueueUrl: queueURL,
};

const run = async () => {
  try {
    const data = await sqsClient.send(new ReceiveMessageCommand(params));
    if (data.Messages != null) {
      try {
        const visibilityParams = {
          QueueUrl: queueURL,
          ReceiptHandle: data.Messages[0].ReceiptHandle,
          VisibilityTimeout: 20, // 20 second timeout
        };
        const results = await sqsClient.send(
          new ChangeMessageVisibilityCommand(visibilityParams)
        );
        console.log("Timeout Changed", results);
      } catch (err) {
        console.log("Delete Error", err);
      }
    } else {
      console.log("No messages to change");
    }
    return data; // For unit tests.
  } catch (err) {
    console.log("Receive Error", err);
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [ChangeMessageVisibility](#) in [AWS SDK for JavaScript API Reference](#).

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Receive an Amazon SQS message and change its timeout visibility.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk')
// Set the region to us-west-2
AWS.config.update({ region: 'us-west-2' })

// Create the SQS service object
var sqs = new AWS.SQS({ apiVersion: '2012-11-05' })

var queueURL = 'https://sqs.REGION.amazonaws.com/ACCOUNT-ID/QUEUE-NAME'

var params = {
  AttributeNames: ['SentTimestamp'],
  MaxNumberOfMessages: 1,
  MessageAttributeNames: ['All'],
  QueueUrl: queueURL
}

sqs.receiveMessage(params, function (err, data) {
  if (err) {
    console.log('Receive Error', err)
```

```
    } else {
        // Make sure we have a message
        if (data.Messages != null) {
            var visibilityParams = {
                QueueUrl: queueURL,
                ReceiptHandle: data.Messages[0].ReceiptHandle,
                VisibilityTimeout: 20 // 20 second timeout
            }
            sqs.changeMessageVisibility(visibilityParams, function (err, data) {
                if (err) {
                    console.log('Delete Error', err)
                } else {
                    console.log('Timeout Changed', data)
                }
            })
        } else {
            console.log('No messages to change')
        }
    })
})
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [ChangeMessageVisibility](#) in [AWS SDK for JavaScript API Reference](#).

## Create a queue

The following code example shows how to create an Amazon SQS queue.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { SQSClient } from "@aws-sdk/client-sqs";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SQS service object.
const sqsClient = new SQSClient({ region: REGION });
export { sqsClient };
```

Create an Amazon SQS standard queue.

```
// Import required AWS SDK clients and commands for Node.js
import { CreateQueueCommand } from "@aws-sdk/client-sqs";
import { sqsClient } from "./libs/sqsClient.js";

// Set the parameters
const params = {
    QueueName: "SQS_QUEUE_NAME", //SQS_QUEUE_URL
    Attributes: {
        DelaySeconds: "60", // Number of seconds delay.
        MessageRetentionPeriod: "86400", // Number of seconds delay.
    },
};

const run = async () => {
    try {
```

```
    const data = await sqsClient.send(new CreateQueueCommand(params));
    console.log("Success", data);
    return data; // For unit tests.
} catch (err) {
    console.log("Error", err);
}
};

run();
```

Create an Amazon SQS queue that waits for a message to arrive.

```
// Import required AWS SDK clients and commands for Node.js
import { CreateQueueCommand } from "@aws-sdk/client-sqs";
import { sqsClient } from "./libs/sqsClient.js";

// Set the parameters
const params = {
    QueueName: "SQS_QUEUE_NAME", //SQS_QUEUE_URL; e.g., 'https://
sqs.REGION.amazonaws.com/ACCOUNT-ID/QUEUE-NAME'
    Attributes: {
        ReceiveMessageWaitTimeSeconds: "20",
    },
};

const run = async () => {
    try {
        const data = await sqsClient.send(new CreateQueueCommand(params));
        console.log("Success", data);
        return data; // For unit tests.
    } catch (err) {
        console.error(err, err.stack);
    }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [CreateQueue in AWS SDK for JavaScript API Reference](#).

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create an Amazon SQS standard queue.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create an SQS service object
var sqs = new AWS.SQS({apiVersion: '2012-11-05'});

var params = {
    QueueName: 'SQS_QUEUE_NAME',
    Attributes: {
        'DelaySeconds': '60',
        'MessageRetentionPeriod': '86400'
    }
};
```

```
    sqs.createQueue(params, function(err, data) {
      if (err) {
        console.log("Error", err);
      } else {
        console.log("Success", data.QueueUrl);
      }
});
```

Create an Amazon SQS queue that waits for a message to arrive.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create the SQS service object
var sqs = new AWS.SQS({apiVersion: '2012-11-05'});

var params = {
  QueueName: 'SQS_QUEUE_NAME',
  Attributes: {
    'ReceiveMessageWaitTimeSeconds': '20',
  }
};

sqs.createQueue(params, function(err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data.QueueUrl);
  }
});
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [CreateQueue](#) in [AWS SDK for JavaScript API Reference](#).

## Delete a message from a queue

The following code example shows how to delete a message from an Amazon SQS queue.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { SQSClient } from "@aws-sdk/client-sqs";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SQS service object.
const sqsClient = new SQSClient({ region: REGION });
export { sqsClient };
```

Receive and delete Amazon SQS messages.

```
// Import required AWS SDK clients and commands for Node.js
import {
  ReceiveMessageCommand,
  DeleteMessageCommand,
} from "@aws-sdk/client-sqs";
import { sqsClient } from "./libs/sqsClient.js";

// Set the parameters
const queueURL = "SQS_QUEUE_URL"; //SQS_QUEUE_URL; e.g., 'https://
sq.s.amazonaws.com/ACCOUNT-ID/QUEUE-NAME'
const params = {
  AttributeNames: ["SentTimestamp"],
  MaxNumberOfMessages: 10,
  MessageAttributeNames: ["All"],
  QueueUrl: queueURL,
  VisibilityTimeout: 20,
  WaitTimeSeconds: 0,
};

const run = async () => {
  try {
    const data = await sqsClient.send(new ReceiveMessageCommand(params));
    if (data.Messages) {
      var deleteParams = {
        QueueUrl: queueURL,
        ReceiptHandle: data.Messages[0].ReceiptHandle,
      };
      try {
        const data = await sqsClient.send(new DeleteMessageCommand(deleteParams));
        console.log("Message deleted", data);
      } catch (err) {
        console.log("Error", err);
      }
    } else {
      console.log("No messages to delete");
    }
    return data; // For unit tests.
  } catch (err) {
    console.log("Receive Error", err);
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [DeleteMessage](#) in [AWS SDK for JavaScript API Reference](#).

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Receive and delete Amazon SQS messages.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create an SQS service object
var sqs = new AWS.SQS({apiVersion: '2012-11-05'});

var queueURL = "SQS_QUEUE_URL";
```

```
var params = {
  AttributeNames: [
    "SentTimestamp"
  ],
  MaxNumberOfMessages: 10,
  MessageAttributeNames: [
    "All"
  ],
  QueueUrl: queueURL,
  VisibilityTimeout: 20,
  WaitTimeSeconds: 0
};

sqS.receiveMessage(params, function(err, data) {
  if (err) {
    console.log("Receive Error", err);
  } else if (data.Messages) {
    var deleteParams = {
      QueueUrl: queueURL,
      ReceiptHandle: data.Messages[0].ReceiptHandle
    };
    sqS.deleteMessage(deleteParams, function(err, data) {
      if (err) {
        console.log("Delete Error", err);
      } else {
        console.log("Message Deleted", data);
      }
    });
  }
});
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [DeleteMessage](#) in [AWS SDK for JavaScript API Reference](#).

## Delete a queue

The following code example shows how to delete an Amazon SQS queue.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { SQSClient } from "@aws-sdk/client-sqs";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SQS service object.
const sqsClient = new SQSClient({ region: REGION });
export { sqsClient };
```

Delete an Amazon SQS queue.

```
// Import required AWS SDK clients and commands for Node.js
import { DeleteQueueCommand } from "@aws-sdk/client-sqs";
import { sqsClient } from "./libs/sqsClient.js";
```

```
// Set the parameters
const params = { QueueUrl: "SQS_QUEUE_URL" }; //SQS_QUEUE_URL e.g., 'https://
sq.s.REGION.amazonaws.com/ACCOUNT-ID/QUEUE-NAME'

const run = async () => {
  try {
    const data = await sqsClient.send(new DeleteQueueCommand(params));
    console.log("Success", data);
    return data; // For unit tests.
  } catch (err) {
    console.error(err, err.stack);
  }
};
run();
```

## Send a message to a queue

The following code example shows how to send a message to an Amazon SQS queue.

## SDK for JavaScript V3

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { SQSClient } from "@aws-sdk/client-sqs";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SQS service object.
const sqsClient = new SQSClient({ region: REGION });
export { sqsClient };
```

Send a message to an Amazon SQS queue.

```
// Import required AWS SDK clients and commands for Node.js
import { SendMessageCommand } from "@aws-sdk/client-sqs";
import { sqsClient } from "./libs/sqsClient.js";

// Set the parameters
const params = {
  DelaySeconds: 10,
  MessageAttributes: {
    Title: {
      DataType: "String",
      StringValue: "The Whistler",
    },
    Author: {
      DataType: "String",
      StringValue: "John Grisham",
    },
    WeeksOn: {
      DataType: "Number",
      StringValue: "6",
    },
  },
  MessageBody:
    "Information about current NY Times fiction bestseller for week of 12/11/2016.",
  // MessageDeduplicationId: "TheWhistler", // Required for FIFO queues
  // MessageGroupId: "Group1", // Required for FIFO queues
  QueueUrl: "SQS_QUEUE_URL" //SQS_QUEUE_URL; e.g., 'https://sqs.REGION.amazonaws.com/
ACCOUNT-ID/QUEUE-NAME'
};

const run = async () => {
  try {
    const data = await sqsClient.send(new SendMessageCommand(params));
    console.log("Success, message sent. MessageID:", data.MessageId);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

Send a message to an Amazon SQS queue.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create an SQS service object
var sqs = new AWS.SQS({apiVersion: '2012-11-05'});
```

```
var params = {
    // Remove DelaySeconds parameter and value for FIFO queues
    DelaySeconds: 10,
    MessageAttributes: {
        "Title": {
            DataType: "String",
            StringValue: "The Whistler"
        },
        "Author": {
            DataType: "String",
            StringValue: "John Grisham"
        },
        "WeeksOn": {
            DataType: "Number",
            StringValue: "6"
        }
    },
    MessageBody: "Information about current NY Times fiction bestseller for week of
12/11/2016.",
    // MessageDeduplicationId: "TheWhistler", // Required for FIFO queues
    // MessageGroupId: "Group1", // Required for FIFO queues
    QueueUrl: "SQS_QUEUE_URL"
};

sqS.sendMessage(params, function(err, data) {
    if (err) {
        console.log("Error", err);
    } else {
        console.log("Success", data.MessageId);
    }
});
```

## AWS STS examples using SDK for JavaScript V3

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for JavaScript V3 with AWS Security Token Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3142\)](#)

## Actions

### Assume a role

The following code example shows how to assume a role with AWS STS.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { STSClient } from "@aws-sdk/client-sts";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon STS service client object.
const stsClient = new STSClient({ region: REGION });
export { stsClient };
```

Assume the IAM role.

```
// Import required AWS SDK clients and commands for Node.js
import { stsClient } from "./libs/stsClient.js";
import {
    AssumeRoleCommand,
    GetCallerIdentityCommand,
} from "@aws-sdk/client-sts";

// Set the parameters
export const params = {
    RoleArn: "ARN_OF_ROLE_TO_ASSUME", //ARN_OF_ROLE_TO_ASSUME
    RoleSessionName: "session1",
    DurationSeconds: 900,
};

export const run = async () => {
    try {
        //Assume Role
        const data = await stsClient.send(new AssumeRoleCommand(params));
        return data;
        const rolecreds = {
            accessKeyId: data.Credentials.AccessKeyId,
            secretAccessKey: data.Credentials.SecretAccessKey,
            sessionToken: data.Credentials.SessionToken,
        };
        //Get Amazon Resource Name (ARN) of current identity
        try {
            const stsParams = { credentials: rolecreds };
            const stsClient = new STSClient(stsParams);
            const results = await stsClient.send(
                new GetCallerIdentityCommand(rolecreds)
            );
            console.log("Success", results);
        } catch (err) {
            console.log(err, err.stack);
        }
    } catch (err) {
        console.log("Error", err);
    }
};
run();
```

- For API details, see [AssumeRole](#) in *AWS SDK for JavaScript API Reference*.

## List medical transcription jobs

The following code example shows how to list Amazon Transcribe Medical transcription jobs.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
const { TranscribeClient } = require("@aws-sdk/client-transcribe");  
// Set the AWS Region.  
const REGION = "REGION"; //e.g. "us-east-1"  
// Create an Amazon Transcribe service client object.  
const transcribeClient = new TranscribeClient({ region: REGION });  
export { transcribeClient };
```

List medical transcription jobs.

```
// Import the required AWS SDK clients and commands for Node.js  
import { StartMedicalTranscriptionJobCommand } from "@aws-sdk/client-transcribe";  
import { transcribeClient } from "./libs/transcribeClient.js";
```

```
// Set the parameters
export const params = {
    MedicalTranscriptionJobName: "MEDICAL_JOB_NAME", // Required
    OutputBucketName: "OUTPUT_BUCKET_NAME", // Required
    Specialty: "PRIMARYCARE", // Required. Possible values are 'PRIMARYCARE'
    Type: "JOB_TYPE", // Required. Possible values are 'CONVERSATION' and 'DICTATION'
    LanguageCode: "LANGUAGE_CODE", // For example, 'en-US'
    MediaFormat: "SOURCE_FILE_FORMAT", // For example, 'wav'
    Media: {
        MediaFileUri: "SOURCE_FILE_LOCATION",
        // The S3 object location of the input media file. The URI must be in the same
        // region
        // as the API endpoint that you are calling. For example,
        // "https://transcribe-demo.s3-REGION.amazonaws.com/hello_world.wav"
    },
};

export const run = async () => {
    try {
        const data = await transcribeClient.send(
            new StartMedicalTranscriptionJobCommand(params)
        );
        console.log("Success - put", data);
        return data; // For unit tests.
    } catch (err) {
        console.log("Error", err);
    }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [ListMedicalTranscriptionJobs](#) in [AWS SDK for JavaScript API Reference](#).

## List transcription jobs

The following code example shows how to list Amazon Transcribe transcription jobs.

### SDK for JavaScript V3

#### Note

  LanguageCode: "LANGUAGE_CODE", // For example, 'en-US'
  MediaFormat: "SOURCE_FILE_FORMAT", // For example, 'wav'
  Media: {
    MediaFileUri: "SOURCE_FILE_LOCATION",
    // The S3 object location of the input media file. The URI must be in the same
    region
    // as the API endpoint that you are calling. For example,
```

```
// "https://transcribe-demo.s3-REGION.amazonaws.com/hello_world.wav"
};

export const run = async () => {
  try {
    const data = await transcribeClient.send(
      new StartMedicalTranscriptionJobCommand(params)
    );
    console.log("Success - put", data);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [StartMedicalTranscriptionJob](#) in [AWS SDK for JavaScript API Reference](#).

## Start a transcription job

The following code example shows how to start an Amazon Transcribe transcription job.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
const { TranscribeClient } = require("@aws-sdk/client-transcribe");
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon Transcribe service client object.
const transcribeClient = new TranscribeClient({ region: REGION });
export { transcribeClient };
```

Start a transcription job.

```
// Import the required AWS SDK clients and commands for Node.js
import { StartTranscriptionJobCommand } from "@aws-sdk/client-transcribe";
import { transcribeClient } from "./libs/transcribeClient.js";

// Set the parameters
export const params = {
  TranscriptionJobName: "JOB_NAME",
  LanguageCode: "LANGUAGE_CODE", // For example, 'en-US'
  MediaFormat: "SOURCE_FILE_FORMAT", // For example, 'wav'
  Media: {
    MediaFileUri: "SOURCE_LOCATION",
    // For example, "https://transcribe-demo.s3-REGION.amazonaws.com/hello_world.wav"
  },
  OutputBucketName: "OUTPUT_BUCKET_NAME"
};

export const run = async () => {
  try {
    const data = await transcribeClient.send(
```

```
    new StartTranscriptionJobCommand(params)
);
console.log("Success - put", data);
return data; // For unit tests.
} catch (err) {
  console.log("Error", err);
}
};

run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [StartTranscriptionJob](#) in [AWS SDK for JavaScript API Reference](#).

## Cross-service examples using SDK for JavaScript V3

The following sample applications use the AWS SDK for JavaScript V3 to work across multiple AWS services.

### Examples

- [Build an Amazon Transcribe app \(p. 3150\)](#)
- [Build an Amazon Transcribe streaming app \(p. 3151\)](#)
- [Build an application to submit data to a DynamoDB table \(p. 3151\)](#)
- [Create an Amazon Lex Chatbot within a web application to engage your web site visitors \(p. 3151\)](#)
- [Create a web application to track DynamoDB data \(p. 3152\)](#)
- [Create an Aurora Serverless work item tracker \(p. 3152\)](#)
- [Create an Amazon Textract explorer application \(p. 3152\)](#)
- [Detect PPE in images with Amazon Rekognition using an AWS SDK \(p. 3153\)](#)
- [Detect objects in images with Amazon Rekognition using an AWS SDK \(p. 3153\)](#)
- [Detect people and objects in a video with Amazon Rekognition using an AWS SDK \(p. 3154\)](#)
- [Invoke a Lambda function from a browser \(p. 3154\)](#)
- [Use API Gateway to invoke a Lambda function \(p. 3154\)](#)
- [Use Step Functions to invoke Lambda functions \(p. 3155\)](#)
- [Use scheduled events to invoke a Lambda function \(p. 3155\)](#)

## Build an Amazon Transcribe app

### SDK for JavaScript V3

Create an app that uses Amazon Transcribe to transcribe and display voice recordings in the browser. The app uses two Amazon Simple Storage Service (Amazon S3) buckets, one to host the application code, and another to store transcriptions. The app uses an Amazon Cognito user pool to authenticate your users. Authenticated users have AWS Identity and Access Management (IAM) permissions to access the required AWS services.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

This example is also available in the [AWS SDK for JavaScript v3 developer guide](#).

### Services used in this example

- Amazon Cognito Identity

- Amazon S3
- Amazon Transcribe

## Build an Amazon Transcribe streaming app

### SDK for JavaScript V3

Shows how to use Amazon Transcribe to build an app that records, transcribes, and translates live audio in real-time, and emails the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Comprehend
- Amazon SES
- Amazon Transcribe
- Amazon Translate

## Build an application to submit data to a DynamoDB table

### SDK for JavaScript V3

This example shows how to build an app that enables users to submit data to an Amazon DynamoDB table, and send a text message to the administrator using Amazon Simple Notification Service (Amazon SNS).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

This example is also available in the [AWS SDK for JavaScript v3 developer guide](#).

### Services used in this example

- DynamoDB
- Amazon SNS

## Create an Amazon Lex Chatbot within a web application to engage your web site visitors

### SDK for JavaScript V3

Shows how to use the Amazon Lex API to create a Chatbot within a web application to engage your web site visitors.

For complete source code and instructions on how to set up and run, see the full example [Building an Amazon Lex chatbot](#) in the AWS SDK for JavaScript developer guide.

### Services used in this example

- Amazon Comprehend
- Amazon Lex
- Amazon Translate

## Create a web application to track DynamoDB data

### SDK for JavaScript V3

Shows how to use the Amazon DynamoDB API to create a dynamic web application that tracks DynamoDB work data.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- DynamoDB
- Amazon SES

## Create an Aurora Serverless work item tracker

### SDK for JavaScript V3

Shows how to use the AWS SDK for JavaScript (v3) to create a web application that tracks work items in an Amazon Aurora database and emails reports by using Amazon Simple Email Service (Amazon SES). This example uses a front end built with React.js to interact with an Express Node.js backend.

- Integrate a React.js web application with AWS services.
- List, add, and update items in an Aurora table.
- Send an email report of filtered work items by using Amazon SES.
- Deploy and manage example resources with the included AWS CloudFormation script.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

## Create an Amazon Textract explorer application

### SDK for JavaScript V3

Shows how to use the AWS SDK for JavaScript to build a React application that uses Amazon Textract to extract data from a document image and display it in an interactive web page. This example runs in a web browser and requires an authenticated Amazon Cognito identity for credentials. It uses Amazon Simple Storage Service (Amazon S3) for storage, and for notifications it polls an Amazon Simple Queue Service (Amazon SQS) queue that is subscribed to an Amazon Simple Notification Service (Amazon SNS) topic.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Cognito Identity
- Amazon S3
- Amazon SNS

- Amazon SQS
- Amazon Textract

## Detect PPE in images with Amazon Rekognition using an AWS SDK

### SDK for JavaScript V3

Shows how to use Amazon Rekognition with the AWS SDK for JavaScript to create an application to detect personal protective equipment (PPE) in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app saves the results to an Amazon DynamoDB table, and sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

Learn how to:

- Create an unauthenticated user using Amazon Cognito.
- Analyze images for PPE using Amazon Rekognition.
- Verify an email address for Amazon SES.
- Update a DynamoDB table with results.
- Send an email notification using Amazon SES.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- DynamoDB
- Amazon Rekognition
- Amazon S3
- Amazon SES

## Detect objects in images with Amazon Rekognition using an AWS SDK

### SDK for JavaScript V3

Shows how to use Amazon Rekognition with the AWS SDK for JavaScript to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

Learn how to:

- Create an unauthenticated user using Amazon Cognito.
- Analyze images for objects using Amazon Rekognition.
- Verify an email address for Amazon SES.
- Send an email notification using Amazon SES.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

## Detect people and objects in a video with Amazon Rekognition using an AWS SDK

### SDK for JavaScript V3

Shows how to use Amazon Rekognition with the AWS SDK for JavaScript to create an app to detect faces and objects in videos located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

Learn how to:

- Create an unauthenticated user using Amazon Cognito.
- Analyze images for PPE using Amazon Rekognition.
- Verify an email address for Amazon SES.
- Send an email notification using Amazon SES.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

## Invoke a Lambda function from a browser

### SDK for JavaScript V2

You can create a browser-based application that uses an AWS Lambda function to update an Amazon DynamoDB table with user selections.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- DynamoDB
- Lambda

### SDK for JavaScript V3

You can create a browser-based application that uses an AWS Lambda function to update an Amazon DynamoDB table with user selections. This app uses AWS SDK for JavaScript v3.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- DynamoDB
- Lambda

## Use API Gateway to invoke a Lambda function

### SDK for JavaScript V3

Shows how to create an AWS Lambda function by using the Lambda JavaScript runtime API. This example invokes different AWS services to perform a specific use case. This example demonstrates how to create a Lambda function invoked by Amazon API Gateway that scans an Amazon DynamoDB

table for work anniversaries and uses Amazon Simple Notification Service (Amazon SNS) to send a text message to your employees that congratulates them at their one year anniversary date.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

This example is also available in the [AWS SDK for JavaScript v3 developer guide](#).

#### Services used in this example

- API Gateway
- DynamoDB
- Lambda
- Amazon SNS

## Use Step Functions to invoke Lambda functions

### SDK for JavaScript V3

Shows how to create an AWS serverless workflow by using AWS Step Functions and the AWS SDK for JavaScript. Each workflow step is implemented using an AWS Lambda function.

Lambda is a compute service that enables you to run code without provisioning or managing servers. Step Functions is a serverless orchestration service that lets you combine Lambda functions and other AWS services to build business-critical applications.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

This example is also available in the [AWS SDK for JavaScript v3 developer guide](#).

#### Services used in this example

- DynamoDB
- Lambda
- Amazon SES
- Step Functions

## Use scheduled events to invoke a Lambda function

### SDK for JavaScript V3

Shows how to create an Amazon EventBridge scheduled event that invokes an AWS Lambda function. Configure EventBridge to use a cron expression to schedule when the Lambda function is invoked. In this example, you create a Lambda function by using the Lambda JavaScript runtime API. This example invokes different AWS services to perform a specific use case. This example demonstrates how to create an app that sends a mobile text message to your employees that congratulates them at the one year anniversary date.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

This example is also available in the [AWS SDK for JavaScript v3 developer guide](#).

#### Services used in this example

- DynamoDB
- EventBridge
- Lambda
- Amazon SNS

# Code examples for SDK for Java 2.x

The code examples in this topic show you how to use the AWS SDK for Java 2.x with AWS.

## Examples

- [Single-service actions and scenarios using SDK for Java 2.x \(p. 3156\)](#)
- [Cross-service examples using SDK for Java 2.x \(p. 3494\)](#)

## Single-service actions and scenarios using SDK for Java 2.x

The following code examples show how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with AWS services.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

## Services

- [API Gateway examples using SDK for Java 2.x \(p. 3157\)](#)
- [Application Recovery Controller examples using SDK for Java 2.x \(p. 3159\)](#)

## Actions

### Create a REST API

The following code example shows how to create an API Gateway REST API.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String createAPI( ApiGatewayClient apiGateway, String restApiId,
String restApiName) {

    try {
        CreateRestApiRequest request = CreateRestApiRequest.builder()
            .cloneFrom(restApiId)
            .description("Created using the Gateway Java API")
            .name(restApiName)
            .build();

        CreateRestApiResponse response = apiGateway.createRestApi(request);
        System.out.println("The id of the new api is "+response.id());
        return response.id();

    } catch (ApiGatewayException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
    return "";
}
```

- For API details, see [CreateRestApi](#) in *AWS SDK for Java 2.x API Reference*.

## Delete a REST API

The following code example shows how to delete an API Gateway REST API.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void deleteAPI( ApiGatewayClient apiGateway, String restApiId) {  
    try {  
        DeleteRestApiRequest request = DeleteRestApiRequest.builder()  
            .restApiId(restApiId)  
            .build();  
  
        apiGateway.deleteRestApi(request);  
        System.out.println("The API was successfully deleted");  
  
    } catch (ApiGatewayException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
}
```

- For API details, see [DeleteRestApi](#) in *AWS SDK for Java 2.x API Reference*.

## Delete a deployment

The following code example shows how to delete a deployment.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void deleteSpecificDeployment(ApiGatewayClient apiGateway, String  
restApiId, String deploymentId) {  
  
    try {  
        DeleteDeploymentRequest request = DeleteDeploymentRequest.builder()  
            .restApiId(restApiId)  
            .deploymentId(deploymentId)  
            .build();  
  
        apiGateway.deleteDeployment(request);  
        System.out.println("Deployment was deleted" );  
  
    } catch (ApiGatewayException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
}
```

```
}
```

- For API details, see [DeleteDeployment](#) in *AWS SDK for Java 2.x API Reference*.

## Deploy a REST API

The following code example shows how to deploy an API Gateway REST API.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String createNewDeployment(ApiGatewayClient apiGateway, String
restApiId, String stageName) {

    try {
        CreateDeploymentRequest request = CreateDeploymentRequest.builder()
            .restApiId(restApiId)
            .description("Created using the AWS API Gateway Java API")
            .stageName(stageName)
            .build();

        CreateDeploymentResponse response = apiGateway.createDeployment(request);
        System.out.println("The id of the deployment is "+response.id());
        return response.id();

    } catch (ApiGatewayException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
    return "";
}
```

- For API details, see [CreateDeployment](#) in *AWS SDK for Java 2.x API Reference*.

## Application Recovery Controller examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon Route 53 Application Recovery Controller.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

## Actions

### Get the state of a routing control

The following code example shows how to get the state of an Application Recovery Controller routing control.

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static GetRoutingControlStateResponse
getRoutingControlState(List<ClusterEndpoint> clusterEndpoints,
                      String
routingControlArn) {
    for (ClusterEndpoint clusterEndpoint : clusterEndpoints) {
        try {
            System.out.println(clusterEndpoint);
            Route53RecoveryClusterClient client =
Route53RecoveryClusterClient.builder()
                .endpointOverride(URI.create(clusterEndpoint.endpoint()))
                .region(Region.of(clusterEndpoint.region())).build();
            return client.getRoutingControlState(
                GetRoutingControlStateRequest.builder()
                    .routingControlArn(routingControlArn).build());
        } catch (Exception exception) {
            System.out.println(exception);
        }
    }
    return null;
}
```

- For API details, see [GetRoutingControlState](#) in *AWS SDK for Java 2.x API Reference*.

## Update the state of a routing control

The following code example shows how to update the state of an Application Recovery Controller routing control.

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static UpdateRoutingControlStateResponse
updateRoutingControlState(List<ClusterEndpoint> clusterEndpoints,
                          String
routingControlArn,
                          String
routingControlState) {
    for (ClusterEndpoint clusterEndpoint : clusterEndpoints) {
        try {
            System.out.println(clusterEndpoint);
            Route53RecoveryClusterClient client =
Route53RecoveryClusterClient.builder()
                .endpointOverride(URI.create(clusterEndpoint.endpoint()))
                .region(Region.of(clusterEndpoint.region()))
                .build();
            return client.updateRoutingControlState(
                UpdateRoutingControlStateRequest.builder()
                    .routingControlArn(routingControlArn).routingControlState(routingControlState).build());
        } catch (Exception exception) {
            System.out.println(exception);
        }
    }
}
```

```
        }
    }
    return null;
}
```

- For API details, see [UpdateRoutingControlState](#) in *AWS SDK for Java 2.x API Reference*.

## Aurora examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon Aurora.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

    try {
        CreateDbClusterParameterGroupRequest groupRequest =
CreateDbClusterParameterGroupRequest.builder()
            .dbClusterParameterGroupName(dbClusterGroupName)
            .dbParameterGroupFamily(dbParameterGroupFamily)
            .description("Created by using the AWS SDK for Java")
            .build();

        CreateDbClusterParameterGroupResponse response =
rdsClient.createDBClusterParameterGroup(groupRequest);
        System.out.println("The group name is " +
response.dbClusterParameterGroup().dbClusterParameterGroupName());

    } catch (RdsException e) {
        System.out.println(e.getLocalizedMessage());
        System.exit(1);
    }
}
```

- For API details, see [CreateDBClusterParameterGroup](#) in *AWS SDK for Java 2.x API Reference*.

## Create a DB cluster snapshot

The following code example shows how to create an Aurora DB cluster snapshot.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void createDBClusterSnapshot(RdsClient rdsClient, String dbInstanceClusterIdentifier, String dbSnapshotIdentifier) {
    try {
        CreateDbClusterSnapshotRequest snapshotRequest =
CreateDbClusterSnapshotRequest.builder()
            .dbClusterIdentifier(dbInstanceClusterIdentifier)
            .dbClusterSnapshotIdentifier(dbSnapshotIdentifier)
            .build();

        CreateDbClusterSnapshotResponse response =
rdsClient.createDBClusterSnapshot(snapshotRequest);
        System.out.println("The Snapshot ARN is " +
response.dbClusterSnapshot().dbClusterSnapshotArn());
```

```
        } catch (RdsException e) {
            System.out.println(e.getLocalizedMessage());
            System.exit(1);
    }
}
```

- For API details, see [CreateDBClusterSnapshot](#) in *AWS SDK for Java 2.x API Reference*.

## Create a DB instance in a DB cluster

The following code example shows how to create a DB instance in an Aurora DB cluster.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String createDBInstanceCluster(RdsClient rdsClient,
                                             String dbInstanceIdentifier,
                                             String dbInstanceClusterIdentifier,

```

```
        System.out.println(e.getLocalizedMessage());
        System.exit(1);
    }
}
```

- For API details, see [DescribeDBClusterParameters](#) in *AWS SDK for Java 2.x API Reference*.

## Update parameters in a DB cluster parameter group

The following code example shows how to update parameters in an Aurora DB cluster parameter group.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void describeDbClusterParameterGroups(RdsClient rdsClient, String dbClusterGroupName) {
    try {
        DescribeDbClusterParameterGroupsRequest groupsRequest =
DescribeDbClusterParameterGroupsRequest.builder()
        .dbClusterParameterGroupName(dbClusterGroupName)
        .maxRecords(20)
        .build();

        List<DBClusterParameterGroup> groups =
rdsClient.describeDBClusterParameterGroups(groupsRequest).dbClusterParameterGroups();
        for (DBClusterParameterGroup group: groups) {
            System.out.println("The group name is
"+group.dbClusterParameterGroupName());
            System.out.println("The group ARN is
"+group.dbClusterParameterGroupArn());
        }

    } catch (RdsException e) {
        System.out.println(e.getLocalizedMessage());
        System.exit(1);
    }
}
```

- For API details, see [ModifyDBClusterParameterGroup](#) in *AWS SDK for Java 2.x API Reference*.

## Scenarios

### Get started with DB clusters

The following code example shows how to:

- Create a custom Aurora DB cluster parameter group and set parameter values.
- Create a DB cluster that is configured to use the parameter group.
- Create a DB instance in the DB cluster that contains a database.
- Take a snapshot of the DB cluster.
- Delete the instance, DB cluster, and parameter group.

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/**  
 * Before running this Java (v2) code example, set up your development environment,  
 * including your credentials.  
 *  
 * For more information, see the following documentation topic:  
 *  
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html  
 *  
 * This Java example performs the following tasks:  
 *  
 * 1. Gets available engine families for Amazon Aurora MySQL-Compatible Edition by  
 * calling the DescribeDbEngineVersions(Engine='aurora-mysql') method.  
 * 2. Selects an engine family and creates a custom DB cluster parameter group by  
 * invoking the describeDBClusterParameters method.  
 * 3. Gets the parameter groups by invoking the describeDBClusterParameterGroups  
 * method.  
 * 4. Gets parameters in the group by invoking the describeDBClusterParameters method.  
 * 5. Modifies the auto_increment_offset parameter by invoking the  
 * modifyDBClusterParameterGroupRequest method.  
 * 6. Gets and displays the updated parameters.  
 * 7. Gets a list of allowed engine versions by invoking the describeDbEngineVersions  
 * method.  
 * 8. Creates an Aurora DB cluster database cluster that contains a MySQL database.  
 * 9. Waits for DB instance to be ready.  
 * 10. Gets a list of instance classes available for the selected engine.  
 * 11. Creates a database instance in the cluster.  
 * 12. Waits for DB instance to be ready.  
 * 13. Creates a snapshot.  
 * 14. Waits for DB snapshot to be ready.  
 * 15. Deletes the DB cluster.  
 * 16. Deletes the DB cluster group.

## Actions

### Create a function

The following code example shows how to create an Amazon CloudFront function.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String createNewFunction(CloudFrontClient cloudFrontClient, String
functionName, String filePath) {

    try {

        InputStream is = new FileInputStream(filePath);
        SdkBytes functionCode = SdkBytes.fromInputStream(is);

        FunctionConfig config = FunctionConfig.builder()
            .comment("Created by using the CloudFront Java API")
            .runtime(FunctionRuntime.CLOUDFRONT_JS_1_0)
            .build();

        CreateFunctionRequest functionRequest = CreateFunctionRequest.builder()
            .name(functionName)
            .functionCode(functionCode)
            .functionConfig(config)
    }
}
```

```
        .build();

        CreateFunctionResponse response =
cloudFrontClient.createFunction(functionRequest);
        return response.functionSummary().functionMetadata().functionARN();

    } catch (CloudFrontException | FileNotFoundException e){
        System.err.println(e.getMessage());
        System.exit(1);
    }
    return "";
}
```

## Actions

### Create an alarm that watches a metric

The following code example shows how to create an Amazon CloudWatch alarm that watches a metric.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void putMetricAlarm(CloudWatchClient cw, String alarmName, String
instanceId) {

    try {
        Dimension dimension = Dimension.builder()
            .name("InstanceId")
            .value(instanceId).build();

        PutMetricAlarmRequest request = PutMetricAlarmRequest.builder()
            .alarmName(alarmName)
            .comparisonOperator(ComparisonOperator.GREATER_THAN_THRESHOLD)
            .evaluationPeriods(1)
            .metricName("CPUUtilization")
            .namespace("AWS/EC2")
            .period(60)
            .statistic(Statistic.AVERAGE)
            .threshold(70.0)
            .actionsEnabled(false)
            .alarmDescription("Alarm when server CPU utilization exceeds 70%")
    }
}
```

```
        .unit(StandardUnit.SECONDS)
        .dimensions(dimension)
        .build();

    cw.putMetricAlarm(request);
    System.out.printf("Successfully created alarm with name %s", alarmName);

} catch (CloudWatchException e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}
}
```

- For API details, see [PutMetricAlarm](#) in *AWS SDK for Java 2.x API Reference*.

## Delete alarms

The following code example shows how to delete Amazon CloudWatch alarms.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void deleteCWAAlarm(CloudWatchClient cw, String alarmName) {

    try {

        cw.deleteAlarms(request);
        System.out.printf("Successfully deleted alarm %s", alarmName);

    } catch (CloudWatchException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [DeleteAlarms](#) in *AWS SDK for Java 2.x API Reference*.

## Describe alarms for a metric

The following code example shows how to describe Amazon CloudWatch alarms for a metric.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void desCWAAlarms( CloudWatchClient cw) {
    try {

        boolean done = false;
```

```
String newToken = null;

while(!done) {
    DescribeAlarmsResponse response;
    if (newToken == null) {
        DescribeAlarmsRequest request =
DescribeAlarmsRequest.builder().build();
        response = cw.describeAlarms(request);
    } else {
        DescribeAlarmsRequest request = DescribeAlarmsRequest.builder()
            .nextToken(newToken)
            .build();
        response = cw.describeAlarms(request);
    }

    for(MetricAlarm alarm : response.metricAlarms()) {
        System.out.printf("\n Retrieved alarm %s", alarm.alarmName());
    }

    if(response.nextToken() == null) {
        done = true;
    } else {
        newToken = response.nextToken();
    }
}

} catch (CloudWatchException e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}
System.out.printf("Done");
}
```

- For API details, see [DescribeAlarmsForMetric](#) in *AWS SDK for Java 2.x API Reference*.

## Disable alarm actions

The following code example shows how to disable Amazon CloudWatch alarm actions.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void disableActions(CloudWatchClient cw, String alarmName) {

    try {
        DisableAlarmActionsRequest request = DisableAlarmActionsRequest.builder()
            .alarmNames(alarmName)
            .build();

        cw.disableAlarmActions(request);
        System.out.printf("Successfully disabled actions on alarm %s", alarmName);

    } catch (CloudWatchException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

## List metrics

The following code example shows how to list Amazon CloudWatch metrics.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void listMets( CloudWatchClient cw, String namespace) {  
  
    boolean done = false;  
    String nextToken = null;  
  
    try {  
        while(!done) {  
  
            ListMetricsResponse response;  
            if (nextToken == null) {  
                ListMetricsRequest request = ListMetricsRequest.builder()  
                    .namespace(namespace)  
                    .build();  
  
                response = cw.listMetrics(request);  
            } else {  
                ListMetricsRequest request = ListMetricsRequest.builder()  
                    .namespace(namespace)  
                    .nextToken(nextToken)
```

```
        .build();

        response = cw.listMetrics(request);
    }

    for (Metric metric : response.metrics()) {
        System.out.printf("Retrieved metric %s", metric.metricName());
        System.out.println();
    }

    if(response.nextToken() == null) {
        done = true;
    } else {
        nextToken = response.nextToken();
    }
}

} catch (CloudWatchException e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}
}
```

- For API details, see [ListMetrics](#) in *AWS SDK for Java 2.x API Reference*.

## Put data into a metric

The following code example shows how to put data into a Amazon CloudWatch metric.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void putMetData(CloudWatchClient cw, Double dataPoint ) {

    try {
        Dimension dimension = Dimension.builder()
            .name("UNIQUE_PAGES")
            .value("URLS")
            .build();

        // Set an Instant object.
        String time =
ZonedDateTime.now( ZoneOffset.UTC ).format( DateTimeFormatter.ISO_INSTANT );
        Instant instant = Instant.parse(time);

        MetricDatum datum = MetricDatum.builder()
            .metricName("PAGES_VISITED")
            .unit(StandardUnit.NONE)
            .value(dataPoint)
            .timestamp(instant)
            .dimensions(dimension).build();

        PutMetricDataRequest request = PutMetricDataRequest.builder()
            .namespace("SITE/TRAFFIC")
            .metricData(datum).build();

        cw.putMetricData(request);

    } catch (CloudWatchException e) {
```

```
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
    System.out.printf("Successfully put data point %f", dataPoint);
}
```

- For API details, see [PutMetricData](#) in *AWS SDK for Java 2.x API Reference*.

## CloudWatch Events examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon CloudWatch Events.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3189\)](#)

## Actions

### Adding a Lambda function target

The following code example shows how to add an AWS Lambda function target to an Amazon CloudWatch Events event.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void putCWTTargets(CloudWatchEventsClient cwe, String ruleName, String
functionArn, String targetId ) {

    try {
        Target target = Target.builder()
            .arn(functionArn)
            .id(targetId)
            .build();

        PutTargetsRequest request = PutTargetsRequest.builder()
            .targets(target)
            .rule(ruleName)
            .build();

        cwe.putTargets(request);
        System.out.printf(
            "Successfully created CloudWatch events target for rule %s",
            ruleName);

    } catch (CloudWatchException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [PutTargets](#) in *AWS SDK for Java 2.x API Reference*.

## Create a scheduled rule

The following code example shows how to create an Amazon CloudWatch Events scheduled rule.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void putCWRule(CloudWatchEventsClient cwe, String ruleName, String roleArn) {  
  
    try {  
        PutRuleRequest request = PutRuleRequest.builder()  
            .name(ruleName)  
            .roleArn(roleArn)  
            .scheduleExpression("rate(5 minutes)")  
            .state(RuleState.ENABLED)  
            .build();  
  
        PutRuleResponse response = cwe.putRule(request);  
        System.out.printf(  
            "Successfully created CloudWatch events rule %s with arn %s",  
            roleArn, response.ruleArn());  
  
    } catch (  
        CloudWatchException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
}
```

- For API details, see [PutRule](#) in *AWS SDK for Java 2.x API Reference*.

## Send events

The following code example shows how to send Amazon CloudWatch Events events.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void putCWEVENTS(CloudWatchEventsClient cwe, String resourceArn ) {  
    try {

## Actions

### Create a subscription filter

The following code example shows how to create an Amazon CloudWatch Logs subscription filter.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void putSubFilters(CloudWatchLogsClient cwl,
String filter,
String pattern,
String logGroup,
String functionArn) {

try {
PutSubscriptionFilterRequest request =
PutSubscriptionFilterRequest.builder()
.filterName(filter)
.filterPattern(pattern)
.logGroupName(logGroup)
.destinationArn(functionArn)
.build();

cwl.putSubscriptionFilter(request);
}
```

```
        System.out.printf(
            "Successfully created CloudWatch logs subscription filter %s",
            filter);

    } catch (CloudWatchLogsException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [PutSubscriptionFilter](#) in *AWS SDK for Java 2.x API Reference*.

## Delete a subscription filter

The following code example shows how to delete an Amazon CloudWatch Logs subscription filter.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void deleteSubFilter(CloudWatchLogsClient logs, String filter, String
logGroup) {

    try {
        DeleteSubscriptionFilterRequest request =
DeleteSubscriptionFilterRequest.builder()
            .filterName(filter)
            .logGroupName(logGroup)
            .build();

        logs.deleteSubscriptionFilter(request);
        System.out.printf("Successfully deleted CloudWatch logs subscription filter
%s", filter);

    } catch (CloudWatchException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [DeleteSubscriptionFilter](#) in *AWS SDK for Java 2.x API Reference*.

## Describe existing subscription filters

The following code example shows how to describe Amazon CloudWatch Logs existing subscription filters.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void describeFilters(CloudWatchLogsClient logs, String logGroup) {
```

```
try {
    boolean done = false;
    String newToken = null;

    while(!done) {
        DescribeSubscriptionFiltersResponse response;
        if (newToken == null) {
            DescribeSubscriptionFiltersRequest request =
DescribeSubscriptionFiltersRequest.builder()
                .logGroupName(logGroup)
                .limit(1).build();

            response = logs.describeSubscriptionFilters(request);
        } else {
            DescribeSubscriptionFiltersRequest request =
DescribeSubscriptionFiltersRequest.builder()
                .nextToken(newToken)
                .logGroupName(logGroup)
                .limit(1).build();
            response = logs.describeSubscriptionFilters(request);
        }

        for(SubscriptionFilter filter : response.subscriptionFilters()) {
            System.out.printf("Retrieved filter with name %s, " + "pattern %s "
+ "and destination arn %s",
                filter.filterName(),
                filter.filterPattern(),
                filter.destinationArn());
        }

        if(response.nextToken() == null) {
            done = true;
        } else {
            newToken = response.nextToken();
        }
    }

} catch (CloudWatchException e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}
System.out.printf("Done");
}
```

- For API details, see [DescribeSubscriptionFilters](#) in *AWS SDK for Java 2.x API Reference*.

## Amazon Cognito Identity Provider examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon Cognito Identity Provider.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3194\)](#)
- [Scenarios \(p. 3199\)](#)

## Actions

### Confirm a user

The following code example shows how to confirm an Amazon Cognito user.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void confirmSignUp(CognitoIdentityProviderClient
identityProviderClient, String clientId, String code, String userName) {

    try {
        ConfirmSignUpRequest signUpRequest = ConfirmSignUpRequest.builder()
            .clientId(clientId)
            .confirmationCode(code)
            .username(userName)
            .build();

        identityProviderClient.confirmSignUp(signUpRequest);
        System.out.println(userName + " was confirmed");

    } catch(CognitoIdentityProviderException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [ConfirmSignUp in AWS SDK for Java 2.x API Reference](#).

### Get a token to associate an MFA application with a user

The following code example shows how to get a token to associate an MFA application with an Amazon Cognito user.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String getSecretForAppMFA(CognitoIdentityProviderClient
identityProviderClient, String session) {

    AssociateSoftwareTokenRequest softwareTokenRequest =
AssociateSoftwareTokenRequest.builder()
    .session(session)
    .build();

    AssociateSoftwareTokenResponse tokenResponse =
identityProviderClient.associateSoftwareToken(softwareTokenRequest) ;
    String secretCode = tokenResponse.secretCode();
    System.out.println("Enter this token into Google Authenticator");
    System.out.println(secretCode);
    return tokenResponse.session();
}
```

- For API details, see [AssociateSoftwareToken](#) in *AWS SDK for Java 2.x API Reference*.

## Get information about a user

The following code example shows how to get information about an Amazon Cognito user.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void getAdminUser(CognitoIdentityProviderClient
identityProviderClient, String userName, String poolId) {

    try {
        Admin GetUserRequest userRequest = Admin GetUserRequest.builder()
            .username(userName)
            .userPoolId(poolId)
            .build();

        Admin GetUserResponse response =
identityProviderClient.admin GetUser(userRequest);
        System.out.println("User status "+response.userStatusAsString());

    } catch (CognitoIdentityProviderException e){
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [Admin GetUser](#) in *AWS SDK for Java 2.x API Reference*.

## List users

The following code example shows how to list Amazon Cognito users.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void listAllUsers(CognitoIdentityProviderClient cognitoClient, String
userPoolId ) {

            .build();

        ListUsersResponse response = cognitoClient.listUsers(usersRequest);
        response.users().forEach(user -> {
            System.out.println("User " + user.username() + " Status " +
user.userStatus() + " Created " + user.userCreateDate() );
        });

    } catch (CognitoIdentityProviderException e){
```

```
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }

    // Shows how to list users by using a filter.
    public static void listUsersFilter(CognitoIdentityProviderClient cognitoClient,
String userPoolId ) {

    try {
        String filter = "email = \"tblue@noserver.com\"";
        ListUsersRequest usersRequest = ListUsersRequest.builder()
            .userPoolId(userPoolId)
            .filter(filter)
            .build();

        ListUsersResponse response = cognitoClient.listUsers(usersRequest);
        response.users().forEach(user -> {
            System.out.println("User with filter applied " + user.username() + " "
Status " + user.userStatus() + " Created " + user.userCreateDate() );
        });
    } catch (CognitoIdentityProviderException e){
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [ListUsers](#) in *AWS SDK for Java 2.x API Reference*.

## Resend a confirmation code

The following code example shows how to resend an Amazon Cognito confirmation code.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void resendConfirmationCode(CognitoIdentityProviderClient
identityProviderClient, String clientId, String userName) {

    try {
        ResendConfirmationCodeRequest codeRequest =
ResendConfirmationCodeRequest.builder()
            .clientId(clientId)
            .username(userName)
            .build();

        ResendConfirmationCodeResponse response =
identityProviderClient.resendConfirmationCode(codeRequest);
        System.out.println("Method of delivery is
"+response.codeDeliveryDetails().deliveryMediumAsString());

    } catch(CognitoIdentityProviderException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [ResendConfirmationCode](#) in *AWS SDK for Java 2.x API Reference*.

## Respond to an authentication challenge

The following code example shows how to respond to an Amazon Cognito authentication challenge.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Respond to an authentication challenge.
public static void adminRespondToAuthChallenge(CognitoIdentityProviderClient
identityProviderClient, String userName, String clientId, String mfaCode, String
session) {

    System.out.println("SOFTWARE_TOKEN_MFA challenge is generated");
    Map<String, String> challengeResponses = new HashMap<>();

    challengeResponses.put("USERNAME", userName);
    challengeResponses.put("SOFTWARE_TOKEN_MFA_CODE", mfaCode);

    RespondToAuthChallengeRequest respondToAuthChallengeRequest =
RespondToAuthChallengeRequest.builder()
        .challengeName(ChallengeNameType.SOFTWARE_TOKEN_MFA)
        .clientId(clientId)
        .challengeResponses(challengeResponses)
        .session(session)
        .build();

    RespondToAuthChallengeResponse respondToAuthChallengeResult =
identityProviderClient.respondToAuthChallenge(respondToAuthChallengeRequest);
    System.out.println("respondToAuthChallengeResult.getAuthenticationResult()" +
respondToAuthChallengeResult.authenticationResult());
}
```

- For API details, see [AdminRespondToAuthChallenge](#) in *AWS SDK for Java 2.x API Reference*.

## Sign up a user

The following code example shows how to sign up a user with Amazon Cognito.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void signUp(CognitoIdentityProviderClient identityProviderClient,
String clientId, String userName, String password, String email) {

    AttributeType userAttrs = AttributeType.builder()
        .name("email")
        .value(email)
        .build();

    List<AttributeType> userAttrsList = new ArrayList<>();
```

```
        userAttrsList.add(userAttrs);

        try {
            SignUpRequest signUpRequest = SignUpRequest.builder()
                .userAttributes(userAttrsList)
                .username(userName)
                .clientId(clientId)
                .password(password)
                .build();

            identityProviderClient.signUp(signUpRequest);
            System.out.println("User has been signed up ");

        } catch(CognitoIdentityProviderException e) {

## Start authentication with administrator credentials

The following code example shows how to start authentication with Amazon Cognito and administrator credentials.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static InitiateAuthResponse initiateAuth(CognitoIdentityProviderClient
identityProviderClient, String clientId, String userName, String password) {

    try {
        Map<String, String> authParameters = new HashMap<>();
        authParameters.put("USERNAME", userName);
        authParameters.put("PASSWORD", password);

        InitiateAuthRequest authRequest = InitiateAuthRequest.builder()
            .clientId(clientId)
            .authParameters(authParameters)
            .authFlow(AuthFlowType.USER_PASSWORD_AUTH)
            .build();

        InitiateAuthResponse response =
identityProviderClient.initiateAuth(authRequest);
        System.out.println("Result Challenge is : " + response.challengeName() );
        return response;

    } catch(CognitoIdentityProviderException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }

    return null;
}
```

- For API details, see [AdminInitiateAuth](#) in *AWS SDK for Java 2.x API Reference*.

## Verify an MFA application with a user

The following code example shows how to verify an MFA application with an Amazon Cognito user.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Verify the TOTP and register for MFA.
public static void verifyTOTP(CognitoIdentityProviderClient identityProviderClient,
String session, String code) {

    try {
        VerifySoftwareTokenRequest tokenRequest =
VerifySoftwareTokenRequest.builder()
            .userCode(code)
            .session(session)
            .build();

        VerifySoftwareTokenResponse verifyResponse =
identityProviderClient.verifySoftwareToken(tokenRequest);
        System.out.println("The status of the token is "
+verifyResponse.statusAsString());

    } catch(CognitoIdentityProviderException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [VerifySoftwareToken](#) in *AWS SDK for Java 2.x API Reference*.

## Scenarios

### Sign up a user with a user pool that requires MFA

The following code example shows how to:

- Sign up a user with a user name, password, and email address.
- Confirm the user from a code sent in email.
- Set up multi-factor authentication by associating an MFA application with the user.
- Sign in by using a password and an MFA code.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/**
 * Before running this Java V2 code example, set up your development environment,
including your credentials.
*
* For more information, see the following documentation:
*
* https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html

```

```

/*
 * TIP: To set up the required user pool, run the AWS Cloud Development
 * Kit (AWS CDK) script provided in this GitHub repo at resources/cdk/
 * cognito_scenario_user_pool_with_mfa.
 */
/* This code example performs the following operations:
 *
 * 1. Invokes the signUp method to sign up a user.
 * 2. Invokes the adminGetUser method to get the user's confirmation status.
 * 3. Invokes the ResendConfirmationCode method if the user requested another code.
 * 4. Invokes the confirmSignUp method.
 * 5. Invokes the initiateAuth to sign in. This results in being prompted to set up
 * TOTP (time-based one-time password). (The response is "ChallengeName": "MFA_SETUP").
 * 6. Invokes the AssociateSoftwareToken method to generate a TOTP MFA private key.
 * This can be used with Google Authenticator.
 * 7. Invokes the VerifySoftwareToken method to verify the TOTP and register for MFA.
 * 8. Invokes the AdminInitiateAuth to sign in again. This results in being prompted to
 * submit a TOTP (Response: "ChallengeName": "SOFTWARE_TOKEN_MFA").
 * 9. Invokes the AdminRespondToAuthChallenge to get back a token.
 */

## Actions

### Create a table

The following code example shows how to create a DynamoDB table.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String createTable(DynamoDbClient ddb, String tableName, String key) {
    DynamoDbWaiter dbWaiter = ddb.waiter();
    CreateTableRequest request = CreateTableRequest.builder()
        .attributeDefinitions(AttributeDefinition.builder()
            .attributeName(key)
            .attributeType(ScalarAttributeType.S)
            .build())
        .keySchema(KeySchemaElement.builder()
            .attributeName(key)
            .keyType(KeyType.HASH)
            .build())
        .provisionedThroughput(ProvisionedThroughput.builder()
            .readCapacityUnits(new Long(10))
            .writeCapacityUnits(new Long(10))
            .build())
        .tableName(tableName)
        .build();

    String newTable = "";
    try {
        CreateTableResponse response = ddb.createTable(request);
        DescribeTableRequest tableRequest = DescribeTableRequest.builder()
            .tableName(tableName)
            .build();

        // Wait until the Amazon DynamoDB table is created.
        WaiterResponse<DescribeTableResponse> waiterResponse =
        dbWaiter.waitUntilTableExists(tableRequest);
        waiterResponse.matched().response().ifPresent(System.out::println);
        newTable = response.tableDescription().tableName();
        return newTable;
    } catch (DynamoDbException e) {
```

```
        System.err.println(e.getMessage());
        System.exit(1);
    }
    return "";
}
```

## Delete a table

The following code example shows how to delete a DynamoDB table.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void deleteDynamoDBTable(DynamoDbClient ddb, String tableName) {

    DeleteTableRequest request = DeleteTableRequest.builder()
        .tableName(tableName)
        .build();

    try {
        ddb.deleteTable(request);

    } catch (DynamoDbException e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
    System.out.println(tableName + " was successfully deleted!");
}
```

- For API details, see [DeleteTable](#) in *AWS SDK for Java 2.x API Reference*.

## Delete an item from a table

The following code example shows how to delete an item from a DynamoDB table.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void deleteDynamoDBItem(DynamoDbClient ddb, String tableName, String
key, String keyVal) {
    HashMap<String,AttributeValue> keyToGet = new HashMap<>();
    keyToGet.put(key, AttributeValue.builder()
        .s(keyVal)
        .build());

    DeleteItemRequest deleteReq = DeleteItemRequest.builder()
        .tableName(tableName)
        .key(keyToGet)
        .build();
}
```

```
        try {
            ddb.deleteItem(deleteReq);
        } catch (DynamoDbException e) {
            System.err.println(e.getMessage());
            System.exit(1);
        }
    }
```

- For API details, see [DeleteItem](#) in *AWS SDK for Java 2.x API Reference*.

## Get an item from a table

The following code example shows how to get an item from a DynamoDB table.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Gets an item from a table by using the `DynamoDbClient`.

```
public static int queryTable(DynamoDbClient ddb, String tableName, String
partitionKeyName, String partitionKeyVal, String partitionAlias) {

    // Set up an alias for the partition key name in case it's a reserved word.
    HashMap<String, String> attrNameAlias = new HashMap<String, String>();
    attrNameAlias.put(partitionAlias, partitionKeyName);

    // Set up mapping of the partition name with the value.
    HashMap<String, AttributeValue> attrValues = new HashMap<>();

    attrValues.put(":" + partitionKeyName, AttributeValue.builder()
        .s(partitionKeyVal)
        .build());

    QueryRequest queryReq = QueryRequest.builder()
        .tableName(tableName)
        .keyConditionExpression(partitionAlias + " = :" + partitionKeyName)
        .expressionAttributeNames(attrNameAlias)
        .expressionAttributeValues(attrValues)
        .build();

    try {
        QueryResponse response = ddb.query(queryReq);
        return response.count();
    } catch (DynamoDbException e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
    return -1;
}
```

- For API details, see [GetItem](#) in *AWS SDK for Java 2.x API Reference*.

## Get information about a table

The following code example shows how to get information about a DynamoDB table.

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void describeDynamoDBTable(DynamoDbClient ddb, String tableName) {  
  
    DescribeTableRequest request = DescribeTableRequest.builder()  
        .tableName(tableName)  
        .build();  
  
    try {  
        TableDescription tableInfo = ddb.describeTable(request).table();  
        if (tableInfo != null) {  
            System.out.format("Table name : %s\n", tableInfo.tableName());  
            System.out.format("Table ARN : %s\n", tableInfo.tableArn());  
            System.out.format("Status : %s\n", tableInfo.tableStatus());  
            System.out.format("Item count : %d\n",  
                tableInfo.itemCount().longValue());  
            System.out.format("Size (bytes): %d\n",  
                tableInfo.tableSizeBytes().longValue());  
  
            ProvisionedThroughputDescription throughputInfo =  
                tableInfo.provisionedThroughput();  
            System.out.println("Throughput");  
            System.out.format(" Read Capacity : %d\n",  
                throughputInfo.readCapacityUnits().longValue());  
            System.out.format(" Write Capacity: %d\n",  
                throughputInfo.writeCapacityUnits().longValue());  
  
            List<AttributeDefinition> attributes =  
                tableInfo.attributeDefinitions();  
            System.out.println("Attributes");  
  
            for (AttributeDefinition a : attributes) {  
                System.out.format(" %s (%s)\n", a.attributeName(),  
                    a.attributeType());  
            }  
        }  
    } catch (DynamoDbException e) {  
        System.err.println(e.getMessage());  
        System.exit(1);  
    }  
    System.out.println("\nDone!");  
}
```

- For API details, see [DescribeTable](#) in *AWS SDK for Java 2.x API Reference*.

## List tables

The following code example shows how to list DynamoDB tables.

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void listAllTables(DynamoDbClient ddb){
```

```
boolean moreTables = true;
String lastName = null;

while(moreTables) {
    try {
        ListTablesResponse response = null;
        if (lastName == null) {
            ListTablesRequest request = ListTablesRequest.builder().build();
            response = ddb.listTables(request);
        } else {
            ListTablesRequest request = ListTablesRequest.builder()
                .exclusiveStartTableName(lastName).build();
            response = ddb.listTables(request);
        }

        List<String> tableNames = response.tableNames();
        if (tableNames.size() > 0) {
            for (String curName : tableNames) {
                System.out.format("* %s\n", curName);
            }
        } else {
            System.out.println("No tables found!");
            System.exit(0);
        }

        lastName = response.lastEvaluatedTableName();
        if (lastName == null) {
            moreTables = false;
        }
    } catch (DynamoDbException e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
}
System.out.println("\nDone!");
}
```

- For API details, see [ListTables](#) in *AWS SDK for Java 2.x API Reference*.

## Put an item in a table

The following code example shows how to put an item in a DynamoDB table.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Puts an item into a table by using the enhanced client.

```
public static void putRecord(DynamoDbEnhancedClient enhancedClient) {
    try {
        DynamoDbTable<Customer> custTable = enhancedClient.table("Customer",
TableSchema.fromBean(Customer.class));

        // Create an Instant value.
        LocalDate localDate = LocalDate.parse("2020-04-07");
        LocalDateTime localDateTime = localDate.atStartOfDay();
        Instant instant = localDateTime.toInstant(ZoneOffset.UTC);
```

```
// Populate the Table.  
Customer custRecord = new Customer();  
custRecord.setCustName("Tom red");  
custRecord.setId("id101");  
custRecord.setEmail("tred@noserver.com");  
custRecord.setRegistrationDate(instant) ;  
  
// Put the customer data into an Amazon DynamoDB table.  
custTable.putItem(custRecord);  
  
} catch (DynamoDbException e) {  
    System.err.println(e.getMessage());  
    System.exit(1);  
}  
System.out.println("Customer data added to the table with id id101");  
}
```

- For API details, see [PutItem](#) in *AWS SDK for Java 2.x API Reference*.

## Query a table

The following code example shows how to query a DynamoDB table.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Queries a table by using the enhanced client.

```
public static String queryTable(DynamoDbEnhancedClient enhancedClient) {  
  
    try{  
        DynamoDbTable<Customer> mappedTable = enhancedClient.table("Customer",  
TableSchema.fromBean(Customer.class));  
        QueryConditional queryConditional =  
QueryConditional.keyEqualTo(Key.builder()  
            .partitionValue("id101")  
            .build());  
  
        // Get items in the table and write out the ID value.  
        Iterator<Customer> results =  
mappedTable.query(queryConditional).items().iterator();  
        String result="";  
  
        while (results.hasNext()) {  
            Customer rec = results.next();  
            result = rec.getId();  
            System.out.println("The record id is "+result);  
        }  
        return result;  
  
    } catch (DynamoDbException e) {  
        System.err.println(e.getMessage());  
        System.exit(1);  
    }  
    return "";  
}
```

Queries a table by using the enhanced client and a secondary index.

```
public static void queryIndex(DynamoDbClient ddb, String tableName) {  
  
    try {  
        // Create a DynamoDbEnhancedClient and use the DynamoDbClient object.  
        DynamoDbEnhancedClient enhancedClient = DynamoDbEnhancedClient.builder()  
            .dynamoDbClient(ddb)  
            .build();  
  
        //Create a DynamoDbTable object based on Movies.  
        DynamoDbTable<Movies> table = enhancedClient.table("Movies",  
TableSchema.fromBean(Movies.class));  
        String dateVal = "2013";  
  
        DynamoDbIndex<Movies> secIndex = enhancedClient.table("Movies",  
TableSchema.fromBean(Movies.class)).index("year-index");  
        AttributeValue attVal = AttributeValue.builder()  
            .n(dateVal)  
            .build();  
  
        // Create a QueryConditional object that's used in the query operation.  
        QueryConditional queryConditional = QueryConditional  
            .keyEqualTo(Key.builder().partitionValue(attVal)  
            .build());  
  
        // Get items in the table.  
        SdkIterable<Page<Movies>> results =  
secIndex.query(QueryEnhancedRequest.builder()  
            .queryConditional(queryConditional)  
            .limit(300)  
            .build());  
  
        // Display the results.  
        results.forEach(page -> {  
            List<Movies> allMovies = page.items();  
            for (Movies myMovies: allMovies) {  
                System.out.println("The movie title is " + myMovies.getTitle() + ".  
The year is " + myMovies.getYear());  
            }  
        });  
  
    } catch (DynamoDbException e) {  
        System.err.println(e.getMessage());  
        System.exit(1);  
    }  
}
```

Queries a table by using the DynamoDbClient.

```
public static int queryTable(DynamoDbClient ddb, String tableName, String  
partitionKeyName, String partitionKeyVal, String partitionAlias) {  
  
    // Set up an alias for the partition key name in case it's a reserved word.  
    HashMap<String, String> attrNameAlias = new HashMap<String, String>();  
    attrNameAlias.put(partitionAlias, partitionKeyName);  
  
    // Set up mapping of the partition name with the value.  
    HashMap<String, AttributeValue> attrValues = new HashMap<>();  
  
    attrValues.put(": "+partitionKeyName, AttributeValue.builder()  
        .s(partitionKeyVal)  
        .build());
```

```
QueryRequest queryReq = QueryRequest.builder()
    .tableName(tableName)
    .keyConditionExpression(partitionAlias + " = :" + partitionKeyName)
    .expressionAttributeNames(attrNameAlias)
    .expressionAttributeValues(attrValues)
    .build();

try {
    QueryResponse response = ddb.query(queryReq);
    return response.count();

} catch (DynamoDbException e) {
    System.err.println(e.getMessage());
    System.exit(1);
}
return -1;
}
```

Queries a table by using the DynamoDbClient and a secondary index.

```
public static void queryIndex(DynamoDbClient ddb, String tableName) {

    try {
        Map<String, String> expressionAttributesNames = new HashMap<>();
        expressionAttributesNames.put("#year", "year");
        Map<String, AttributeValue> expressionAttributeValues = new HashMap<>();
        expressionAttributeValues.put(":yearValue",
        AttributeValue.builder().n("2013").build());

        QueryRequest request = QueryRequest.builder()
            .tableName(tableName)
            .indexName("year-index")
            .keyConditionExpression("#year = :yearValue")
            .expressionAttributeNames(expressionAttributesNames)
            .expressionAttributeValues(expressionAttributeValues)
            .build();

        System.out.println("== Movie Titles ==");
        QueryResponse response = ddb.query(request);
        response.items()
            .forEach(movie -> System.out.println(movie.get("title").s()));

    } catch (DynamoDbException e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
}
```

- For API details, see [Query in AWS SDK for Java 2.x API Reference](#).

## Scan a table

The following code example shows how to scan a DynamoDB table.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Scans an Amazon DynamoDB table by using the enhanced client.

```
public static void scan( DynamoDbEnhancedClient enhancedClient) {
    try{
        DynamoDbTable<Customer> custTable = enhancedClient.table("Customer",
TableSchema.fromBean(Customer.class));
        Iterator<Customer> results = custTable.scan().items().iterator();
        while (results.hasNext()) {
            Customer rec = results.next();
            System.out.println("The record id is "+rec.getId());
            System.out.println("The name is " +rec.getCustName());
        }
    } catch (DynamoDbException e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
    System.out.println("Done");
}
```

- For API details, see [Scan](#) in *AWS SDK for Java 2.x API Reference*.

## Update an item in a table

The following code example shows how to update an item in a DynamoDB table.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Updates an item located in a table by using the enhanced client.

```
public static String modifyItem(DynamoDbEnhancedClient enhancedClient, String
keyVal, String email) {

    try {

        DynamoDbTable<Customer> mappedTable = enhancedClient.table("Customer",
TableSchema.fromBean(Customer.class));
        Key key = Key.builder()
            .partitionValue(keyVal)
            .build();

        // Get the item by using the key and update the email value.
        Customer customerRec = mappedTable.getItem(r->r.key(key));
        customerRec.setEmail(email);
        mappedTable.updateItem(customerRec);
        return customerRec.getEmail();

    } catch (DynamoDbException e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
    return "";
}
```

- For API details, see [UpdateItem](#) in *AWS SDK for Java 2.x API Reference*.

## Write a batch of items

The following code example shows how to write a batch of DynamoDB items.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Inserts many items into a table by using the enhanced client.

```
public static void putBatchRecords(DynamoDbEnhancedClient enhancedClient) {  
  
    try {  
        DynamoDbTable<Customer> customerMappedTable =  
enhancedClient.table("Customer", TableSchema.fromBean(Customer.class));  
        DynamoDbTable<Music> musicMappedTable = enhancedClient.table("Music",  
TableSchema.fromBean(Music.class));  
        LocalDate localDate = LocalDate.parse("2020-04-07");  
        LocalDateTime localDateTime = localDate.atStartOfDay();  
        Instant instant = localDateTime.toInstant(ZoneOffset.UTC);  
  
        Customer record2 = new Customer();  
        record2.setCustName("Fred Pink");  
        record2.setId("id110");  
        record2.setEmail("fredp@noserver.com");  
        record2.setRegistrationDate(instant) ;  
  
        Customer record3 = new Customer();  
        record3.setCustName("Susan Pink");  
        record3.setId("id120");  
        record3.setEmail("spink@noserver.com");  
        record3.setRegistrationDate(instant) ;  
  
        Customer record4 = new Customer();  
        record4.setCustName("Jerry orange");  
        record4.setId("id101");  
        record4.setEmail("jorange@noserver.com");  
        record4.setRegistrationDate(instant) ;  
  
        BatchWriteItemEnhancedRequest batchWriteItemEnhancedRequest =  
BatchWriteItemEnhancedRequest.builder()  
            .writeBatches(  
                WriteBatch.builder(Customer.class)           // add items to  
the Customer table  
                    .mappedTableResource(customerMappedTable)  
                    .addPutItem(builder -> builder.item(record2))  
                    .addPutItem(builder -> builder.item(record3))  
                    .addPutItem(builder -> builder.item(record4))  
                    .build(),  
                WriteBatch.builder(Music.class)           // delete an  
item from the Music table  
                    .mappedTableResource(musicMappedTable)  
                    .addDeleteItem(builder -> builder.key(  
                        Key.builder().partitionValue("Famous  
Band").build()))  
                    .build())  
            .build();  
  
        // Add three items to the Customer table and delete one item from the Music  
table  
        enhancedClient.batchWriteItem(batchWriteItemEnhancedRequest);  
    }  
}
```

```
        System.out.println("done");

    } catch (DynamoDbException e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
}
```

- For API details, see [BatchWriteItem in AWS SDK for Java 2.x API Reference](#).

## Scenarios

### Get started using tables, items, and queries

The following code example shows how to:

- Create a table that can hold movie data.
- Put, get, and update a single movie in the table.
- Write movie data to the table from a sample JSON file.
- Query for movies that were released in a given year.
- Scan for movies that were released in a range of years.
- Delete a movie from the table.
- Delete the table.

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a DynamoDB table.

```
// Create a table with a Sort key.
public static void createTable(DynamoDbClient ddb, String tableName) {
    DynamoDbWaiter dbWaiter = ddb.waiter();
    ArrayList<AttributeDefinition> attributeDefinitions = new ArrayList<>();

    // Define attributes.
    attributeDefinitions.add(AttributeDefinition.builder()
        .attributeName("year")
        .attributeType("N")
        .build());

    attributeDefinitions.add(AttributeDefinition.builder()
        .attributeName("title")
        .attributeType("S")
        .build());

    ArrayList<KeySchemaElement> tableKey = new ArrayList<>();

        }

    } catch (DynamoDbException e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
}
```

Full example.

```
/*
 * Before running this Java V2 code example, set up your development environment,
 * including your credentials.
 *
 * For more information, see the following documentation topic:
 *
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html
 *
 * This Java example performs these tasks:

```

```
/*
 * 1. Creates the Amazon DynamoDB Movie table with partition and sort key.
 * 2. Puts data into the Amazon DynamoDB table from a JSON document using the Enhanced
client.
 * 3. Gets data from the Movie table.
 * 4. Adds a new item.
 * 5. Updates an item.
 * 6. Uses a Scan to query items using the Enhanced client.
 * 7. Queries all items where the year is 2013 using the Enhanced Client.
 * 8. Deletes the table.
*/
```

```

## Query a table by using batches of PartiQL statements

The following code example shows how to:

- Get a batch of items by running multiple SELECT statements.
- Add a batch of items by running multiple INSERT statements.
- Update a batch of items by running multiple UPDATE statements.
- Delete a batch of items by running multiple DELETE statements.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```

## Query a table using PartiQL

The following code example shows how to:

- Get an item by running a SELECT statement.
- Add an item by running an INSERT statement.
- Update an item by running an UPDATE statement.
- Delete an item by running a DELETE statement.

### SDK for Java 2.x

## Amazon EC2 examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon Elastic Compute Cloud.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Get started

#### Hello Amazon EC2

The following code examples show how to get started using Amazon Elastic Compute Cloud (Amazon EC2).

Java

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void describeEC2SecurityGroups(Ec2Client ec2, String groupId) {
    try {
        DescribeSecurityGroupsRequest request =
DescribeSecurityGroupsRequest.builder()
        .groupIds(groupId)
```

```
        .build();

        DescribeSecurityGroupsResponse response =
ec2.describeSecurityGroups(request);
        for(SecurityGroup group : response.securityGroups()) {
            System.out.printf(
                "Found Security Group with id %s, " +
                "vpc id %s " +
                "and description %s",
                group.groupId(),
                group.vpcId(),
                group.description());
        }

    } catch (Ec2Exception e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}
}
```

- For API details, see [DescribeSecurityGroups](#) in *AWS SDK for Java 2.x API Reference*.

## Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
import boto3

def hello_ec2(ec2_resource):
    """
    Use the AWS SDK for Python (Boto3) to create an Amazon Elastic Compute Cloud
    (Amazon EC2) resource and list the security groups in your account.
    This example uses the default settings specified in your shared credentials
    and config files.

    :param ec2_resource: A Boto3 EC2 ServiceResource object. This object is a high-
level
                        resource that wraps the low-level EC2 service API.
    """
    print("Hello, Amazon EC2! Let's list up to 10 of your security groups:")
    for sg in ec2_resource.security_groups.limit(10):
        print(f"\t{sg.id}: {sg.group_name}")

if __name__ == '__main__':
    hello_ec2(boto3.resource('ec2'))
```

- For API details, see [DescribeSecurityGroups](#) in *AWS SDK for Python (Boto3) API Reference*.

## Topics

- [Actions \(p. 3240\)](#)
- [Scenarios \(p. 3249\)](#)

## Actions

### Allocate an Elastic IP address

The following code example shows how to allocate an Elastic IP address for Amazon EC2.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String getAllocateAddress( Ec2Client ec2, String instanceId) {  
  
    try {  
        AllocateAddressRequest allocateRequest = AllocateAddressRequest.builder()  
            .domain(DomainType.VPC)  
            .build();  
  
        AllocateAddressResponse allocateResponse =  
ec2.allocateAddress(allocateRequest);  
        String allocationId = allocateResponse.allocationId();  
        AssociateAddressRequest associateRequest =  
AssociateAddressRequest.builder()  
            .instanceId(instanceId)  
            .allocationId(allocationId)  
            .build();  
  
        AssociateAddressResponse associateResponse =  
ec2.associateAddress(associateRequest);  
        return associateResponse.associationId();  
  
    } catch (Ec2Exception e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
    return "";  
}
```

- For API details, see [AllocateAddress in AWS SDK for Java 2.x API Reference](#).

### Associate an Elastic IP address with an instance

The following code example shows how to associate an Elastic IP address with an Amazon EC2 instance.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String associateAddress(Ec2Client ec2, String instanceId, String  
allocationId) {  
    try {  
        AssociateAddressRequest associateRequest =  
AssociateAddressRequest.builder()  
            .instanceId(instanceId)  
            .allocationId(allocationId)  
            .build();  
    }
```

```
        AssociateAddressResponse associateResponse =
    ec2.associateAddress(associateRequest);
    return associateResponse.associationId();

} catch (Ec2Exception e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}
return "";
}
```

- For API details, see [AssociateAddress](#) in *AWS SDK for Java 2.x API Reference*.

## Create a security group

The following code example shows how to create an Amazon EC2 security group.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String createEC2SecurityGroup( Ec2Client ec2, String groupName, String
groupDesc, String vpcId) {
try {

    CreateSecurityGroupRequest createRequest =
CreateSecurityGroupRequest.builder()
    .groupName(groupName)
    .description(groupDesc)
    .vpcId(vpcId)
    .build();

    CreateSecurityGroupResponse resp= ec2.createSecurityGroup(createRequest);

    IpRange ipRange = IpRange.builder()
        .cidrIp("0.0.0.0/0").build();

    IpPermission ipPerm = IpPermission.builder()
        .ipProtocol("tcp")
        .toPort(80)
        .fromPort(80)

## Create a security key pair

The following code example shows how to create a security key pair for Amazon EC2.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void createEC2KeyPair(Ec2Client ec2, String keyName ) {
    try {
        CreateKeyPairRequest request = CreateKeyPairRequest.builder()
            .keyName(keyName)
            .build();

        ec2.createKeyPair(request);
        System.out.printf("Successfully created key pair named %s", keyName);

    } catch (Ec2Exception e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [CreateKeyPair](#) in *AWS SDK for Java 2.x API Reference*.

## Create and run an instance

The following code example shows how to create and run an Amazon EC2 instance.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String createEC2Instance(Ec2Client ec2, String name, String amiId ) {

    RunInstancesRequest runRequest = RunInstancesRequest.builder()
        .imageId(amiId)
        .instanceType(InstanceType.T1_MICRO)
```

```
.maxCount(1)
.minCount(1)
.build();

RunInstancesResponse response = ec2.runInstances(runRequest);
String instanceId = response.instances().get(0).instanceId();
Tag tag = Tag.builder()
    .key("Name")
    .value(name)
    .build();

CreateTagsRequest tagRequest = CreateTagsRequest.builder()
    .resources(instanceId)
    .tags(tag)
    .build();

try {
    ec2.createTags(tagRequest);
    System.out.printf("Successfully started EC2 Instance %s based on AMI %s",
instanceId, amiId);
    return instanceId;
} catch (Ec2Exception e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}

return "";
}
```

- For API details, see [RunInstances](#) in *AWS SDK for Java 2.x API Reference*.

## Delete a security group

The following code example shows how to delete an Amazon EC2 security group.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void deleteEC2SecGroup(Ec2Client ec2, String groupId) {

    try {
        DeleteSecurityGroupRequest request = DeleteSecurityGroupRequest.builder()
            .groupId(groupId)
            .build();

        ec2.deleteSecurityGroup(request);
        System.out.printf("Successfully deleted Security Group with id %s",
groupId);

    } catch (Ec2Exception e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

## Delete a security key pair

The following code example shows how to delete an Amazon EC2 security key pair.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void deleteKeys(Ec2Client ec2, String keyPair) {  
  
    try {  
        DeleteKeyPairRequest request = DeleteKeyPairRequest.builder()  
            .keyName(keyPair)  
            .build();  
  
        ec2.deleteKeyPair(request);  
        System.out.printf("Successfully deleted key pair named %s", keyPair);  
  
    } catch (Ec2Exception e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
}
```

- For API details, see [DeleteKeyPair](#) in *AWS SDK for Java 2.x API Reference*.

## Describe instances

The following code example shows how to describe Amazon EC2 instances.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String describeEC2Instances( Ec2Client ec2, String newInstanceId) {  
    try {  
        String pubAddress = "";  
        boolean isRunning = false;  
        DescribeInstancesRequest request = DescribeInstancesRequest.builder()  
            .instanceIds(newInstanceId)  
            .build();  
  
        while (!isRunning) {  
            DescribeInstancesResponse response = ec2.describeInstances(request);  
            String state =  
response.reservations().get(0).instances().get(0).state().name().name();  
            if (state.compareTo("RUNNING") == 0) {  
                System.out.println("Image id is " +  
response.reservations().get(0).instances().get(0).imageId());  
                System.out.println("Instance type is " +  
response.reservations().get(0).instances().get(0).instanceType());  
                System.out.println("Instance state is " +  
response.reservations().get(0).instances().get(0).state().name());  
                pubAddress =  
response.reservations().get(0).instances().get(0).publicIpAddress();  
                System.out.println("Instance address is " + pubAddress);  
            }  
        }  
    } catch (Ec2Exception e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
}
```

```
        isRunning = true;
    }
    return pubAddress;
} catch (SsmException e) {
    System.err.println(e.getMessage());
    System.exit(1);
}
return "";
}
```

- For API details, see [DescribeInstances](#) in *AWS SDK for Java 2.x API Reference*.

### Disassociate an Elastic IP address from an instance

The following code example shows how to disassociate an Elastic IP address from an Amazon EC2 instance.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void disassociateAddress(Ec2Client ec2, String associationId) {
    try {
        DisassociateAddressRequest addressRequest =
DisassociateAddressRequest.builder()
        .associationId(associationId)
        .build();

        ec2.disassociateAddress(addressRequest);
        System.out.println("You successfully disassociated the address!");

    } catch (Ec2Exception e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [DisassociateAddress](#) in *AWS SDK for Java 2.x API Reference*.

### Get data about a security group

The following code example shows how to get data about an Amazon EC2 security group.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void describeSecurityGroups(Ec2Client ec2, String groupId) {
    try {
        DescribeSecurityGroupsRequest request =
DescribeSecurityGroupsRequest.builder()
        .groupIds(groupId)
```

```
.build();

DescribeSecurityGroupsResponse response =
ec2.describeSecurityGroups(request);
for(SecurityGroup group : response.securityGroups()) {
    System.out.println( "Found Security Group with Id " +group.groupId() +
and group VPC "+ group.vpcId());
}

} catch (Ec2Exception e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}
}
```

- For API details, see [DescribeSecurityGroups](#) in *AWS SDK for Java 2.x API Reference*.

## Get data about instance types

The following code example shows how to get data about Amazon EC2 instance types.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Get a list of instance types.
public static String getInstanceTypes(Ec2Client ec2) {
    String instanceType="";
    try {
        List<Filter> filters = new ArrayList<>();
        Filter filter = Filter.builder()
            .name("processor-info.supported-architecture")
            .values("arm64")
            .build();

        filters.add(filter);
        DescribeInstanceTypesRequest typesRequest =
DescribeInstanceTypesRequest.builder()
            .filters(filters)
            .maxResults(10)
            .build();

        DescribeInstanceTypesResponse response =
ec2.describeInstanceTypes(typesRequest);
        List<InstanceTypeInfo> instanceTypes = response.instanceTypes();
        for (InstanceTypeInfo type: instanceTypes) {
            System.out.println("The memory information of this type is
"+type.memoryInfo().sizeInMiB());
            System.out.println("Network information is
"+type.networkInfo().toString());
            instanceType = type.instanceType().toString();
        }

        return instanceType;
    } catch (SsmException e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
}
```

```
        return "";
    }
```

- For API details, see [DescribeInstanceTypes](#) in *AWS SDK for Java 2.x API Reference*.

## Release an Elastic IP address

The following code example shows how to release an Elastic IP address.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void releaseEC2Address(Ec2Client ec2, String allocId) {

    try {
        ReleaseAddressRequest request = ReleaseAddressRequest.builder()
            .allocationId(allocId)
            .build();

        ec2.releaseAddress(request);
        System.out.printf("Successfully released elastic IP address %s", allocId);

    } catch (Ec2Exception e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [ReleaseAddress](#) in *AWS SDK for Java 2.x API Reference*.

## Start an instance

The following code example shows how to start an Amazon EC2 instance.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void startInstance(Ec2Client ec2, String instanceId) {
    Ec2Waiter ec2Waiter = Ec2Waiter.builder()
        .overrideConfiguration(b -> b.maxAttempts(100))
        .client(ec2)
        .build();

    StartInstancesRequest request = StartInstancesRequest.builder()
        .instanceIds(instanceId)
        .build();

    System.out.println("Use an Ec2Waiter to wait for the instance to run. This will
take a few minutes.");
    ec2.startInstances(request);
    DescribeInstancesRequest instanceRequest = DescribeInstancesRequest.builder()
```

```
.instanceIds(instanceId)
.build();

WaiterResponse<DescribeInstancesResponse> waiterResponse =
ec2Waiter.waitUntilInstanceRunning(instanceRequest);
waiterResponse.matched().response().ifPresent(System.out::println);
System.out.println("Successfully started instance "+instanceId);
}
```

- For API details, see [StartInstances](#) in *AWS SDK for Java 2.x API Reference*.

## Stop an instance

The following code example shows how to stop an Amazon EC2 instance.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void stopInstance(Ec2Client ec2, String instanceId) {
    Ec2Waiter ec2Waiter = Ec2Waiter.builder()
        .overrideConfiguration(b -> b.maxAttempts(100))
        .client(ec2)
        .build();
    StopInstancesRequest request = StopInstancesRequest.builder()
        .instanceIds(instanceId)
        .build();

    System.out.println("Use an Ec2Waiter to wait for the instance to stop. This
will take a few minutes.");
    ec2.stopInstances(request);
    DescribeInstancesRequest instanceRequest = DescribeInstancesRequest.builder()
        .instanceIds(instanceId)
        .build();

    WaiterResponse<DescribeInstancesResponse> waiterResponse =
ec2Waiter.waitUntilInstanceStopped(instanceRequest);
    waiterResponse.matched().response().ifPresent(System.out::println);
    System.out.println("Successfully stopped instance "+instanceId);
}
```

- For API details, see [StopInstances](#) in *AWS SDK for Java 2.x API Reference*.

## Terminate an instance

The following code example shows how to terminate an Amazon EC2 instance.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void terminateEC2( Ec2Client ec2, String instanceID) {
```

```
try{
    TerminateInstancesRequest ti = TerminateInstancesRequest.builder()
        .instanceIds(instanceID)
        .build();

    TerminateInstancesResponse response = ec2.terminateInstances(ti);
    List<InstanceStateChange> list = response.terminatingInstances();
    for (InstanceStateChange sc : list) {
        System.out.println("The ID of the terminated instance is " +
sc.instanceId());
    }

} catch (Ec2Exception e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}
}
```

- For API details, see [TerminateInstances](#) in *AWS SDK for Java 2.x API Reference*.

## Scenarios

### Get started with instances

The following code example shows how to:

- Create a key pair that is used to secure SSH communication between your computer and an EC2 instance.
- Create a security group that acts as a virtual firewall for your EC2 instances to control incoming and outgoing traffic.
- Find an Amazon Machine Image (AMI) and a compatible instance type.
- Create an instance that is created from the instance type and AMI you select, and is configured to use the security group and key pair created in this example.
- Stop and restart the instance.
- Create an Elastic IP address and associate it as a consistent IP address for your instance.
- Connect to your instance with SSH, using both its public IP address and your Elastic IP address.
- Clean up all of the resources created by this example.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/**
 * Before running this Java (v2) code example, set up your development environment,
including your credentials.
*
* For more information, see the following documentation topic:
*
* https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html
*
* This Java example performs the following tasks:
*
* 1. Creates an RSA key pair and saves the private key data as a .pem file.
* 2. Lists key pairs.
```

```
* 3. Creates a security group for the default VPC.  
* 4. Displays security group information.  
* 5. Gets a list of Amazon Linux 2 AMIs and selects one.  
* 6. Gets more information about the image.  
* 7. Gets a list of instance types that are compatible with the selected AMI's  
architecture.  
* 8. Creates an instance with the key pair, security group, AMI, and an instance type.  
* 9. Displays information about the instance.  
* 10. Stops the instance and waits for it to stop.  
* 11. Starts the instance and waits for it to start.  
* 12. Allocates an Elastic IP address and associates it with the instance.  
* 13. Displays SSH connection info for the instance.  
* 14. Disassociates and deletes the Elastic IP address.  
* 15. Terminates the instance and waits for it to terminate.  
* 16. Deletes the security group.  
* 17. Deletes the key pair.  
*/

## Amazon EC2 Auto Scaling examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon EC2 Auto Scaling.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3259\)](#)
- [Scenarios \(p. 3266\)](#)

## Actions

### Create a group

The following code example shows how to create an Auto Scaling group.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void createAutoScalingGroup(AutoScalingClient autoScalingClient,
                                         String groupName,
                                         String launchTemplateName,
                                         String serviceLinkedRoleARN,
                                         String vpcZoneId) {

    try {
        AutoScalingWaiter waiter = autoScalingClient.waiter();
        LaunchTemplateSpecification templateSpecification =
LaunchTemplateSpecification.builder()
            .launchTemplateName(launchTemplateName)
            .build();

        CreateAutoScalingGroupRequest request =
CreateAutoScalingGroupRequest.builder()
            .autoScalingGroupName(groupName)
            .availabilityZones("us-east-1a")
            .launchTemplate(templateSpecification)
            .maxSize(1)
            .minSize(1)
            .vpcZoneIdentifier(vpcZoneId)
            .serviceLinkedRoleARN(serviceLinkedRoleARN)
            .build();

        autoScalingClient.createAutoScalingGroup(request);
        DescribeAutoScalingGroupsRequest groupsRequest =
DescribeAutoScalingGroupsRequest.builder()
            .autoScalingGroupNames(groupName)
            .build();

        WaiterResponse<DescribeAutoScalingGroupsResponse> waiterResponse =
waiter.waitUntilGroupExists(groupsRequest);
        waiterResponse.matched().response().ifPresent(System.out::println);
        System.out.println("Auto Scaling Group created");

    } catch (AutoScalingException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [CreateAutoScalingGroup](#) in [AWS SDK for Java 2.x API Reference](#).

## Delete a group

The following code example shows how to delete an Auto Scaling group.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void deleteAutoScalingGroup(AutoScalingClient autoScalingClient,
                                         String groupName) {
    try {
        DeleteAutoScalingGroupRequest deleteAutoScalingGroupRequest =
DeleteAutoScalingGroupRequest.builder()
            .autoScalingGroupName(groupName)
            .forceDelete(true)
```

```
        .build() ;  
  
        autoScalingClient.deleteAutoScalingGroup(deleteAutoScalingGroupRequest) ;  
        System.out.println("You successfully deleted "+groupName);  
  
    } catch (AutoScalingException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
}
```

- For API details, see [DeleteAutoScalingGroup](#) in *AWS SDK for Java 2.x API Reference*.

### Disable metrics collection for a group

The following code example shows how to disable CloudWatch metrics collection for an Auto Scaling group.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void disableMetricsCollection(AutoScalingClient autoScalingClient,  
String groupName) {  
    try {  
        DisableMetricsCollectionRequest disableMetricsCollectionRequest =  
DisableMetricsCollectionRequest.builder()  
            .autoScalingGroupName(groupName)  
            .metrics("GroupMaxSize")  
            .build();  
  
        autoScalingClient.disableMetricsCollection(disableMetricsCollectionRequest);  
        System.out.println("The disable metrics collection operation was  
successful");  
  
    } catch (AutoScalingException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
}
```

- For API details, see [DisableMetricsCollection](#) in *AWS SDK for Java 2.x API Reference*.

### Enable metrics collection for a group

The following code example shows how to enable CloudWatch metrics collection for an Auto Scaling group.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void enableMetricsCollection(AutoScalingClient autoScalingClient,
String groupName) {
    try {

        EnableMetricsCollectionRequest collectionRequest =
EnableMetricsCollectionRequest.builder()
            .autoScalingGroupName(groupName)
            .metrics("GroupMaxSize")
            .granularity("1Minute")
            .build();

        autoScalingClient.enableMetricsCollection(collectionRequest);
        System.out.println("The enable metrics collection operation was
successful");

    } catch (AutoScalingException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [EnableMetricsCollection](#) in *AWS SDK for Java 2.x API Reference*.

## Get information about groups

The following code example shows how to get information about Auto Scaling groups.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String getAutoScaling( AutoScalingClient autoScalingClient, String
groupName) {
    try{
        String instanceId = "";

## Get information about scaling activities

The following code example shows how to get information about Auto Scaling activities.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void describeScalingActivities(AutoScalingClient autoScalingClient,
String groupName) {
    try {
        DescribeScalingActivitiesRequest scalingActivitiesRequest =
        DescribeScalingActivitiesRequest.builder()
            .autoScalingGroupName(groupName)
            .maxRecords(10)
```

```
        .build();

        DescribeScalingActivitiesResponse response =
autoScalingClient.describeScalingActivities(scalingActivitiesRequest);
        List<Activity> activities = response.activities();
        for (Activity activity: activities) {
            System.out.println("The activity Id is "+activity.activityId());
            System.out.println("The activity details are "+activity.details());
        }

    } catch (AutoScalingException e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}
}
```

- For API details, see [DescribeScalingActivities](#) in *AWS SDK for Java 2.x API Reference*.

## Set the desired capacity of a group

The following code example shows how to set the desired capacity of an Auto Scaling group.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void setDesiredCapacity(AutoScalingClient autoScalingClient, String
groupName) {
    try {
        SetDesiredCapacityRequest capacityRequest =
SetDesiredCapacityRequest.builder()
        .autoScalingGroupName(groupName)
        .desiredCapacity(2)
        .build();

        autoScalingClient.setDesiredCapacity(capacityRequest);
        System.out.println("You have set the DesiredCapacity to 2");

    } catch (AutoScalingException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [SetDesiredCapacity](#) in *AWS SDK for Java 2.x API Reference*.

## Terminate an instance in a group

The following code example shows how to terminate an instance in an Auto Scaling group.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void terminateInstanceInAutoScalingGroup(AutoScalingClient autoScalingClient, String instanceId){
    try {
        TerminateInstanceInAutoScalingGroupRequest request =
TerminateInstanceInAutoScalingGroupRequest.builder()
            .instanceId(instanceId)
            .shouldDecrementDesiredCapacity(false)
            .build();

        autoScalingClient.terminateInstanceInAutoScalingGroup(request);
        System.out.println("You have terminated instance "+instanceId);

    } catch (AutoScalingException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [TerminateInstanceInAutoScalingGroup](#) in *AWS SDK for Java 2.x API Reference*.

## Update a group

The following code example shows how to update the configuration for an Auto Scaling group.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void updateAutoScalingGroup(AutoScalingClient autoScalingClient,
String groupName, String launchTemplateName, String serviceLinkedRoleARN) {
    try {
        AutoScalingWaiter waiter = autoScalingClient.waiter();
        LaunchTemplateSpecification templateSpecification =
LaunchTemplateSpecification.builder()
            .launchTemplateName(launchTemplateName)
            .build();

        UpdateAutoScalingGroupRequest groupRequest =
UpdateAutoScalingGroupRequest.builder()
            .maxSize(3)
            .serviceLinkedRoleARN(serviceLinkedRoleARN)
            .autoScalingGroupName(groupName)
            .launchTemplate(templateSpecification)
            .build();

        autoScalingClient.updateAutoScalingGroup(groupRequest);
        DescribeAutoScalingGroupsRequest groupsRequest =
DescribeAutoScalingGroupsRequest.builder()
            .autoScalingGroupNames(groupName)
            .build();

        WaiterResponse<DescribeAutoScalingGroupsResponse> waiterResponse =
waiter.waitUntilGroupInService(groupsRequest);
        waiterResponse.matched().response().ifPresent(System.out::println);
        System.out.println("You successfully updated the auto scaling group
"+groupName);

    } catch (AutoScalingException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
    }
}
```

```
        System.exit(1);
    }
```

- For API details, see [UpdateAutoScalingGroup in AWS SDK for Java 2.x API Reference](#).

## Scenarios

### Manage groups and instances

The following code example shows how to:

- Create an Amazon EC2 Auto Scaling group and configure it with a launch template and Availability Zones.
- Get information about the group and running instances.
- Enable Amazon CloudWatch metrics collection on the group.
- Update the desired capacity of the group and wait for an instance to start.
- Terminate an instance in the group.
- List scaling activities that occur in response to user requests and capacity changes.
- Get statistics for CloudWatch metrics that are collected during the example.
- Stop collecting metrics, terminate all instances, and delete the group.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/**
 * Before running this SDK for Java (v2) code example, set up your development
 * environment, including your credentials.
 *
 * For more information, see the following documentation:
 *
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html
 *
 * In addition, create a launch template. For more information, see the following
 * topic:
 *
 * https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ec2-launch-templates.html#create-launch-template
 *
 * This code example performs the following operations:
 * 1. Creates an Auto Scaling group using an AutoScalingWaiter.
 * 2. Gets a specific Auto Scaling group and returns an instance Id value.
 * 3. Describes Auto Scaling with the Id value.
 * 4. Enables metrics collection.
 * 5. Update an Auto Scaling group.
 * 6. Describes Account details.
 * 7. Describe account details"
 * 8. Updates an Auto Scaling group to use an additional instance.
 * 9. Gets the specific Auto Scaling group and gets the number of instances.
 * 10. List the scaling activities that have occurred for the group.
 * 11. Terminates an instance in the Auto Scaling group.
 * 12. Stops the metrics collection.
```

```
* 13. Deletes the Auto Scaling group.

## EventBridge examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon EventBridge.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3273\)](#)

## Actions

### Create a scheduled rule

The following code example shows how to create an Amazon EventBridge scheduled rule.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void createEBRule(EventBridgeClient eventBrClient, String ruleName, String cronExpression) {

    try {
        PutRuleRequest ruleRequest = PutRuleRequest.builder()
            .name(ruleName)
            .eventBusName("default")
            .scheduleExpression(cronExpression)
            .state("ENABLED")
            .description("A test rule that runs on a schedule created by the
Java API")
            .build();

        PutRuleResponse ruleResponse = eventBrClient.putRule(ruleRequest);
        System.out.println("The ARN of the new rule is "+
ruleResponse.ruleArn());

    } catch (EventBridgeException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [PutRule](#) in *AWS SDK for Java 2.x API Reference*.

## Delete a scheduled rule

The following code example shows how to delete an Amazon EventBridge scheduled rule.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void deleteEBRule(EventBridgeClient eventBrClient, String ruleName) {

    try {
        DisableRuleRequest disableRuleRequest = DisableRuleRequest.builder()
            .name(ruleName)
            .eventBusName("default")
            .build();

        eventBrClient.disableRule(disableRuleRequest);
        DeleteRuleRequest ruleRequest = DeleteRuleRequest.builder()
            .name(ruleName)
            .eventBusName("default")
            .build();

        eventBrClient.deleteRule(ruleRequest);
        System.out.println("Rule "+ruleName+" was successfully deleted!");

    } catch (EventBridgeException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [DeleteRule](#) in *AWS SDK for Java 2.x API Reference*.

## Send events

The following code example shows how to send Amazon EventBridge events.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void putEBEvents(EventBridgeClient eventBrClient, String resourceArn,
String resourceArn2 ) {

    try {
        // Populate a List with the resource ARN values.
        List<String> resources = new ArrayList<>();
        resources.add(resourceArn);
        resources.add(resourceArn2);

        PutEventsRequestEntry reqEntry = PutEventsRequestEntry.builder()
            .resources(resources)
            .source("com.mycompany.myapp")
            .detailType("myDetailType")
            .detail("{ \"key1\": \"value1\", \"key2\": \"value2\" }")
            .build();

        PutEventsRequest eventsRequest = PutEventsRequest.builder()
            .entries(reqEntry)
            .build();

        PutEventsResponse result = eventBrClient.putEvents(eventsRequest);
        for (PutEventsResultEntry resultEntry : result.entries()) {
            if (resultEntry.eventId() != null) {
                System.out.println("Event Id: " + resultEntry.eventId());
            } else {
                System.out.println("Injection failed with Error Code: " +
resultEntry.errorCode());
            }
        }
    } catch (EventBridgeException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [PutEvents](#) in *AWS SDK for Java 2.x API Reference*.

## AWS Glue examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with AWS Glue.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

## Actions

### Create a crawler

The following code example shows how to create an AWS Glue crawler.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void createGlueCrawler(GlueClient glueClient,
                                      String iam,
                                      String s3Path,
                                      String cron,
                                      String dbName,
                                      String crawlerName) {

    try {
        S3Target s3Target = S3Target.builder()
            .path(s3Path)
            .build();

        // Add the S3Target to a list.
        List<S3Target> targetList = new ArrayList<>();
        targetList.add(s3Target);

        CrawlerTargets targets = CrawlerTargets.builder()
            .s3Targets(targetList)
            .build();

        CreateCrawlerRequest crawlerRequest = CreateCrawlerRequest.builder()
            .databaseName(dbName)
            .name(crawlerName)
            .description("Created by the AWS Glue Java API")
            .targets(targets)
            .role(iam)
            .schedule(cron)
            .build();

        glueClient.createCrawler(crawlerRequest);
        System.out.println(crawlerName + " was successfully created");

    } catch (GlueException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [CreateCrawler](#) in *AWS SDK for Java 2.x API Reference*.

### Get a crawler

The following code example shows how to get an AWS Glue crawler.

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void getSpecificCrawler(GlueClient glueClient, String crawlerName) {  
  
    try {  
        GetCrawlerRequest crawlerRequest = GetCrawlerRequest.builder()  
            .name(crawlerName)  
            .build();  
  
        GetCrawlerResponse response = glueClient.getcrawler(crawlerRequest);  
        Instant createDate = response.crawler().creationTime();  
  
        // Convert the Instant to readable date  
        DateTimeFormatter formatter =  
            DateTimeFormatter.ofLocalizedDateTime(FormatStyle.SHORT)  
                .withLocale(Locale.US)  
                .withZone(ZoneId.systemDefault());  
  
        formatter.format(createDate);  
        System.out.println("The create date of the Crawler is " + createDate);  
  
    } catch (GlueException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
}
```

- For API details, see [GetCrawler](#) in *AWS SDK for Java 2.x API Reference*.

## Get a database from the Data Catalog

The following code example shows how to get a database from the AWS Glue Data Catalog.

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void getSpecificDatabase(GlueClient glueClient, String databaseName) {  
  
    try {  
        GetDatabaseRequest databasesRequest = GetDatabaseRequest.builder()  
            .name(databaseName)  
            .build();  
  
        GetDatabaseResponse response = glueClient.getDatabase(databasesRequest);  
        Instant createDate = response.database().createTime();  
  
        // Convert the Instant to readable date.  
        DateTimeFormatter formatter =  
            DateTimeFormatter.ofLocalizedDateTime(FormatStyle.SHORT)  
                .withLocale(Locale.US)  
                .withZone(ZoneId.systemDefault());  
  
        formatter.format(createDate);  
    }
```

```
        System.out.println("The create date of the database is " + createDate);

    } catch (GlueException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [GetDatabase](#) in *AWS SDK for Java 2.x API Reference*.

## Get tables from a database

The following code example shows how to get tables from a database in the AWS Glue Data Catalog.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void getGlueTable(GlueClient glueClient, String dbName, String
tableName ) {

    try {
        GetTableRequest tableRequest = GetTableRequest.builder()
            .databaseName(dbName)
            .name(tableName)
            .build();

        GetTableResponse tableResponse = glueClient.getTable(tableRequest);
        Instant createDate = tableResponse.table().createTime();

        // Convert the Instant to readable date.
        DateTimeFormatter formatter =
DateTimeFormatter.ofLocalizedDateTime( FormatStyle.SHORT )
            .withLocale( Locale.US )
            .withZone( ZoneId.systemDefault() );

        formatter.format( createDate );
        System.out.println("The create date of the table is " + createDate );

    } catch (GlueException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [GetTables](#) in *AWS SDK for Java 2.x API Reference*.

## Start a crawler

The following code example shows how to start an AWS Glue crawler.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void startSpecificCrawler(GlueClient glueClient, String crawlerName) {
    try {
        StartCrawlerRequest crawlerRequest = StartCrawlerRequest.builder()
            .name(crawlerName)
            .build();

        glueClient.startCrawler(crawlerRequest);
    } catch (GlueException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [StartCrawler](#) in *AWS SDK for Java 2.x API Reference*.

## Scenarios

### Get started running crawlers and jobs

The following code example shows how to:

- Create and run a crawler that crawls a public Amazon Simple Storage Service (Amazon S3) bucket and generates a metadata database that describes the CSV-formatted data it finds.
- List information about databases and tables in your AWS Glue Data Catalog.
- Create and run a job that extracts CSV data from the source Amazon S3 bucket, transforms it by removing and renaming fields, and loads JSON-formatted output into another Amazon S3 bucket.
- List information about job runs and view some of the transformed data.
- Delete all resources created by the demo.

For more information, see [Tutorial: Getting started with AWS Glue Studio](#).

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/**  
 * Before running this Java V2 code example, set up your development environment,  
 * including your credentials.  
 *  
 * For more information, see the following documentation topic:  
 *  
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html  
 *  
 * To set up the resources, see this documentation topic:  
 *  
 * https://docs.aws.amazon.com/glue/latest/ug/tutorial-add-crawler.html  
 *  
 * This example performs the following tasks:  
 *  
 * 1. Create a database.  
 * 2. Create a crawler.  
 * 3. Get a crawler.
```

```
* 4. Start a crawler.  
* 5. Get a database.  
* 6. Get tables.  
* 7. Create a job.  
* 8. Start a job run.  
* 9. List all jobs.  
* 10. Get job runs.  
* 11. Delete a job.  
* 12. Delete a database.  
* 13. Delete a crawler.  
*/

## IAM examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with AWS Identity and Access Management.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3286\)](#)
- [Scenarios \(p. 3296\)](#)

## Actions

### Attach a policy to a role

The following code example shows how to attach an IAM policy to a role.

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void attachIAMRolePolicy(IamClient iam, String roleName, String policyArn ) {

    try {
        ListAttachedRolePoliciesRequest request =
ListAttachedRolePoliciesRequest.builder()
        .roleName(roleName)
        .build();

        ListAttachedRolePoliciesResponse response =
iam.listAttachedRolePolicies(request);
        List<AttachedPolicy> attachedPolicies = response.attachedPolicies();

        // Ensure that the policy is not attached to this role
        String polArn = "";
        for (AttachedPolicy policy: attachedPolicies) {
            polArn = policy.policyArn();
            if (polArn.compareTo(policyArn)==0) {
                System.out.println(roleName + " policy is already attached to this
role.");
                return;
            }
        }

        AttachRolePolicyRequest attachRequest = AttachRolePolicyRequest.builder()
        .roleName(roleName)
        .policyArn(policyArn)
        .build();

        iam.attachRolePolicy(attachRequest);

        System.out.println("Successfully attached policy " + policyArn +
                           " to role " + roleName);

    } catch (IamException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
    System.out.println("Done");
}
```

- For API details, see [AttachRolePolicy](#) in *AWS SDK for Java 2.x API Reference*.

## Create a policy

The following code example shows how to create an IAM policy.

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String createIAMPolicy(IamClient iam, String policyName ) {
```

```
try {
    // Create an IamWaiter object.
    IamWaiter iamWaiter = iam.waiter();

    CreatePolicyRequest request = CreatePolicyRequest.builder()
        .policyName(policyName)
        .policyDocument(PolicyDocument)
        .build();

    CreatePolicyResponse response = iam.createPolicy(request);

    // Wait until the policy is created.
    GetPolicyRequest polRequest = GetPolicyRequest.builder()
        .policyArn(response.policy().arn())
        .build();

    WaiterResponse<GetPolicyResponse> waitUntilPolicyExists =
    iamWaiter.waitUntilPolicyExists(polRequest);
    waitUntilPolicyExists.matched().response().ifPresent(System.out::println);
    return response.policy().arn();

} catch (IamException e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}
return "";
}
```

## Create a role

The following code example shows how to create an IAM role.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String createIAMRole(IamClient iam, String rolename, String
fileLocation ) throws Exception {

    try {
        JSONObject json0bject = (JSONObject) readJsonSimpleDemo(fileLocation);
        CreateRoleRequest request = CreateRoleRequest.builder()
            .roleName(rolename)
            .assumeRolePolicyDocument(json0bject.toJSONString())
            .description("Created using the AWS SDK for Java")
            .build();

        CreateRoleResponse response = iam.createRole(request);
        System.out.println("The ARN of the role is "+response.role().arn());

    } catch (IamException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
    return "";
}
```

```
public static Object readJsonSimpleDemo(String filename) throws Exception {
    FileReader reader = new FileReader(filename);
    JSONParser jsonParser = new JSONParser();
    return jsonParser.parse(reader);
}
```

- For API details, see [CreateRole](#) in *AWS SDK for Java 2.x API Reference*.

## Create a user

The following code example shows how to create an IAM user.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String createIAMUser(IamClient iam, String username ) {

    try {
        // Create an IamWaiter object
        IamWaiter iamWaiter = iam.waiter();

        CreateUserRequest request = CreateUserRequest.builder()
            .userName(username)
            .build();

        CreateUserResponse response = iam.createUser(request);

        // Wait until the user is created
        GetUserRequest userRequest = GetUserRequest.builder()
            .userName(response.user().userName())
            .build();

        WaiterResponse<GetUserResponse> waitUntilUserExists =
        iamWaiter.waitUntilUserExists(userRequest);
        waitUntilUserExists.matched().response().ifPresent(System.out::println);
        return response.user().userName();

    } catch (IamException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
    return "";
}
```

- For API details, see [CreateUser](#) in *AWS SDK for Java 2.x API Reference*.

## Create an access key

The following code example shows how to create an IAM access key.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String createIAMAccessKey(IamClient iam, String user) {  
  
    try {  
        CreateAccessKeyRequest request = CreateAccessKeyRequest.builder()  
            .userName(user)  
            .build();  
  
        CreateAccessKeyResponse response = iam.createAccessKey(request);  
        return response.accessKey().accessKeyId();  
  
    } catch (IamException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
    return "";  
}
```

- For API details, see [CreateAccessKey](#) in *AWS SDK for Java 2.x API Reference*.

## Create an alias for an account

The following code example shows how to create an alias for an IAM account.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void createIAMAccountAlias(IamClient iam, String alias) {  
  
    try {  
        CreateAccountAliasRequest request = CreateAccountAliasRequest.builder()  
            .accountAlias(alias)  
            .build();  
  
        iam.createAccountAlias(request);  
        System.out.println("Successfully created account alias: " + alias);  
  
    } catch (IamException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
}
```

- For API details, see [CreateAccountAlias](#) in *AWS SDK for Java 2.x API Reference*.

## Delete a policy

The following code example shows how to delete an IAM policy.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void deleteIAMPolicy(IamClient iam, String policyARN) {  
  
    try {  
        DeletePolicyRequest request = DeletePolicyRequest.builder()  
            .policyArn(policyARN)  
            .build();  
  
        iam.deletePolicy(request);  
        System.out.println("Successfully deleted the policy");  
  
    } catch (IamException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
    System.out.println("Done");  
}
```

- For API details, see [DeletePolicy](#) in *AWS SDK for Java 2.x API Reference*.

## Delete a user

The following code example shows how to delete an IAM user.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void deleteIAMUser(IamClient iam, String userName) {  
  
    try {  
        DeleteUserRequest request = DeleteUserRequest.builder()  
            .userName(userName)  
            .build();  
  
        iam.deleteUser(request);  
        System.out.println("Successfully deleted IAM user " + userName);  
  
    } catch (IamException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
}
```

- For API details, see [DeleteUser](#) in *AWS SDK for Java 2.x API Reference*.

## Delete an access key

The following code example shows how to delete an IAM access key.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void deleteKey(IamClient iam ,String username, String accessKey ) {  
  
    try {  
        DeleteAccessKeyRequest request = DeleteAccessKeyRequest.builder()  
            .accessKeyId(accessKey)  
            .userName(username)  
            .build();  
  
        iam.deleteAccessKey(request);  
        System.out.println("Successfully deleted access key " + accessKey +  
            " from user " + username);  
  
    } catch (IamException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
}
```

- For API details, see [DeleteAccessKey](#) in *AWS SDK for Java 2.x API Reference*.

## Delete an account alias

The following code example shows how to delete an IAM account alias.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void deleteIAMAccountAlias(IamClient iam, String alias ) {  
  
    try {  
        DeleteAccountAliasRequest request = DeleteAccountAliasRequest.builder()  
            .accountAlias(alias)  
            .build();  
  
        iam.deleteAccountAlias(request);  
        System.out.println("Successfully deleted account alias " + alias);  
  
    } catch (IamException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
    System.out.println("Done");  
}
```

- For API details, see [DeleteAccountAlias](#) in *AWS SDK for Java 2.x API Reference*.

## Detach a policy from a role

The following code example shows how to detach an IAM policy from a role.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void detachPolicy(IamClient iam, String roleName, String policyArn ) {
    try {
        DetachRolePolicyRequest request = DetachRolePolicyRequest.builder()
            .roleName(roleName)
            .policyArn(policyArn)
            .build();

        iam.detachRolePolicy(request);
        System.out.println("Successfully detached policy " + policyArn +
            " from role " + roleName);
    } catch (IamException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [DetachRolePolicy](#) in [AWS SDK for Java 2.x API Reference](#).

## List a user's access keys

The following code example shows how to list a user's IAM access keys.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void listKeys( IamClient iam, String userName ){

    try {
        boolean done = false;
        String newMarker = null;

        while (!done) {
            ListAccessKeysResponse response;

            if(newMarker == null) {
                ListAccessKeysRequest request = ListAccessKeysRequest.builder()
                    .userName(userName)
                    .build();

                response = iam.listAccessKeys(request);
            } else {
                ListAccessKeysRequest request = ListAccessKeysRequest.builder()
                    .userName(userName)
                    .marker(newMarker)
                    .build();

                response = iam.listAccessKeys(request);
            }

            for (AccessKeyMetadata metadata : response.accessKeyMetadata()) {
                System.out.format("Retrieved access key %s",
                    metadata.accessKeyId());
            }
        }
    }
}
```

```
        if (!response.isTruncated()) {
            done = true;
        } else {
            newMarker = response.marker();
        }
    }

} catch (IamException e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}
}
```

## Update a user

The following code example shows how to update an IAM user.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void updateIAMUser(IamClient iam, String curName, String newName ) {

    try {
        UpdateUserRequest request = UpdateUserRequest.builder()
            .userName(curName)
            .newUserName(newName)
            .build();

        iam.updateUser(request);
        System.out.printf("Successfully updated user to username %s", newName);

    } catch (IamException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
    }
}
```

```
        System.exit(1);
    }
```

- For API details, see [UpdateUser](#) in *AWS SDK for Java 2.x API Reference*.

## Update an access key

The following code example shows how to update an IAM access key.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void updateKey(IamClient iam, String username, String accessId,
String status) {
    try {
        if (status.toLowerCase().equalsIgnoreCase("active")) {
            statusType = StatusType.ACTIVE;
        } else if (status.toLowerCase().equalsIgnoreCase("inactive")) {
            statusType = StatusType.INACTIVE;
        } else {
            statusType = StatusType.UNKNOWN_TO_SDK_VERSION;
        }

        UpdateAccessKeyRequest request = UpdateAccessKeyRequest.builder()
            .accessKeyId(accessId)
            .userName(username)
            .status(statusType)
            .build();

        iam.updateAccessKey(request);
        System.out.printf("Successfully updated the status of access key %s to" +
            "status %s for user %s", accessId, status, username);

    } catch (IamException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [UpdateAccessKey](#) in *AWS SDK for Java 2.x API Reference*.

## Scenarios

### Create a user and assume a role

The following code example shows how to:

- Create a user who has no permissions.
- Create a role that grants permission to list Amazon S3 buckets for the account.
- Add a policy to let the user assume the role.
- Assume the role and list Amazon S3 buckets using temporary credentials.
- Delete the policy, role, and user.

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create functions that wrap IAM user actions.

```
/*
 To run this Java V2 code example, set up your development environment, including your
 credentials.

 For information, see this documentation topic:

 https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html

 This example performs these operations:

 1. Creates a user that has no permissions.
 2. Creates a role and policy that grants Amazon S3 permissions.
 3. Creates a role.
 4. Grants the user permissions.
 5. Gets temporary credentials by assuming the role. Creates an Amazon S3 Service
 client object with the temporary credentials.
 6. Deletes the resources.

## AWS KMS examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with AWS Key Management Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3302\)](#)

## Actions

### Create a grant for a key

The following code example shows how to create a grant for a KMS key.

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String createGrant(KmsClient kmsClient, String keyId, String
granteePrincipal, String operation) {

    try {
        CreateGrantRequest grantRequest = CreateGrantRequest.builder()
            .keyId(keyId)
            .granteePrincipal(granteePrincipal)
            .operationsWithStrings(operation)
            .build();

        CreateGrantResponse response = kmsClient.createGrant(grantRequest);
        return response.grantId();

    }catch (KmsException e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
    return "";
}
```

- For API details, see [CreateGrant](#) in *AWS SDK for Java 2.x API Reference*.

## Create a key

The following code example shows how to create an AWS KMS key.

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String createKey(KmsClient kmsClient, String keyDesc) {

    try {
        CreateKeyRequest keyRequest = CreateKeyRequest.builder()
            .description(keyDesc)
            .customerMasterKeySpec(CustomerMasterKeySpec.SYMMETRIC_DEFAULT)
            .keyUsage("ENCRYPT_DECRYPT")
            .build();

        CreateKeyResponse result = kmsClient.createKey(keyRequest);
        System.out.printf("Created a customer key with id \"%s\"\n",
result.keyMetadata().arn());
        return result.keyMetadata().keyId();

    } catch (KmsException e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
    return "";
}
```

- For API details, see [CreateKey](#) in *AWS SDK for Java 2.x API Reference*.

## Create an alias for a key

The following code example shows how to create an alias for a KMS key key.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void createCustomAlias(KmsClient kmsClient, String targetKeyId,
String aliasName) {

    try {
        CreateAliasRequest aliasRequest = CreateAliasRequest.builder()
            .aliasName(aliasName)
            .targetKeyId(targetKeyId)
            .build();

        kmsClient.createAlias(aliasRequest);

    } catch (KmsException e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
}
```

- For API details, see [CreateAlias](#) in *AWS SDK for Java 2.x API Reference*.

## Decrypt ciphertext

The following code example shows how to decrypt ciphertext that was encrypted by a KMS key.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void decryptData(KmsClient kmsClient, SdkBytes encryptedData, String
keyId) {

    try {
        DecryptRequest decryptRequest = DecryptRequest.builder()
            .ciphertextBlob(encryptedData)
            .keyId(keyId)
            .build();

        DecryptResponse decryptResponse = kmsClient.decrypt(decryptRequest);
        decryptResponse.plaintext();

    } catch (KmsException e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
}
```

- For API details, see [Decrypt](#) in *AWS SDK for Java 2.x API Reference*.

## Describe a key

The following code example shows how to describe a KMS key.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void describeSpecifcKey(KmsClient kmsClient, String keyId ){  
    try {  
        DescribeKeyRequest keyRequest = DescribeKeyRequest.builder()  
            .keyId(keyId)  
            .build();  
  
        DescribeKeyResponse response = kmsClient.describeKey(keyRequest);  
        System.out.println("The key description is  
"+response.keyMetadata().description());  
        System.out.println("The key ARN is "+response.keyMetadata().arn());  
  
    } catch (KmsException e) {  
        System.err.println(e.getMessage());  
        System.exit(1);  
    }  
}
```

- For API details, see [DescribeKey](#) in *AWS SDK for Java 2.x API Reference*.

## Disable a key

The following code example shows how to disable a KMS key.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void disableKey( KmsClient kmsClient, String keyId ) {  
    try {  
        DisableKeyRequest keyRequest = DisableKeyRequest.builder()  
            .keyId(keyId)  
            .build();  
  
        kmsClient.disableKey(keyRequest);  
  
    } catch (KmsException e) {  
        System.err.println(e.getMessage());  
        System.exit(1);  
    }  
}
```

- For API details, see [DisableKey](#) in *AWS SDK for Java 2.x API Reference*.

## Enable a key

The following code example shows how to enable a KMS key.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void enableKey(KmsClient kmsClient, String keyId) {  
  
    try {  
        EnableKeyRequest enableKeyRequest = EnableKeyRequest.builder()  
            .keyId(keyId)  
            .build();  
  
        kmsClient.enableKey(enableKeyRequest);  
  
    } catch (KmsException e) {  
        System.err.println(e.getMessage());  
        System.exit(1);  
    }  
}
```

- For API details, see [EnableKey](#) in *AWS SDK for Java 2.x API Reference*.

## Encrypt text using a key

The following code example shows how to encrypt text using a KMS key.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static SdkBytes encryptData(KmsClient kmsClient, String keyId) {  
  
    try {  
        SdkBytes myBytes = SdkBytes.fromByteArray(new byte[]{1, 2, 3, 4, 5, 6, 7,  
8, 9, 0});  
  
        EncryptRequest encryptRequest = EncryptRequest.builder()  
            .keyId(keyId)  
            .plaintext(myBytes)  
            .build();  
  
        EncryptResponse response = kmsClient.encrypt(encryptRequest);  
        String algorithm = response.encryptionAlgorithm().toString();  
        System.out.println("The encryption algorithm is " + algorithm);  
  
        // Get the encrypted data.  
        SdkBytes encryptedData = response.ciphertextBlob();  
    } catch (KmsException e) {  
        System.err.println(e.getMessage());  
        System.exit(1);  
    }  
}
```

```
        return encryptedData;
    } catch (KmsException e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
    return null;
}
```

## List aliases for a key

The following code example shows how to list aliases for a KMS key.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void listAllAliases( KmsClient kmsClient ) {

    try {
        ListAliasesRequest aliasesRequest = ListAliasesRequest.builder()
            .limit(15)
            .build();

        ListAliasesResponse aliasesResponse =
        kmsClient.listAliases(aliasesRequest) ;
        List<AliasListEntry> aliases = aliasesResponse_aliases();
        for (AliasListEntry alias: aliases) {
            System.out.println("The alias name is: "+alias.aliasName());
        }

    } catch (KmsException e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
}
```

- For API details, see [ListAliases in AWS SDK for Java 2.x API Reference](#).

## List grants for a key

The following code example shows how to list grants for a KMS key.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void displayGrantIds(KmsClient kmsClient, String keyId) {

    try {
        ListGrantsRequest grantsRequest = ListGrantsRequest.builder()
            .keyId(keyId)
```

```
.limit(15)
.build();

ListGrantsResponse response = kmsClient.listGrants(grantsRequest);
List<GrantListEntry> grants = response.grants();
for ( GrantListEntry grant: grants) {
    System.out.println("The grant Id is : "+grant.grantId());
}

} catch (KmsException e) {
    System.err.println(e.getMessage());
    System.exit(1);
}
}
```

- For API details, see [ListGrants](#) in *AWS SDK for Java 2.x API Reference*.

## List keys

The following code example shows how to list KMS keys.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void listAllKeys(KmsClient kmsClient) {

    try {
        ListKeysRequest listKeysRequest = ListKeysRequest.builder()
            .limit(15)
            .build();

        ListKeysResponse keysResponse = kmsClient.listKeys(listKeysRequest);
        List<KeyListEntry> keyListEntries = keysResponse.keys();
        for (KeyListEntry key : keyListEntries) {
            System.out.println("The key ARN is: " + key.keyArn());
            System.out.println("The key Id is: " + key.keyId());
        }

    } catch (KmsException e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
}
```

- For API details, see [ListKeys](#) in *AWS SDK for Java 2.x API Reference*.

## Kinesis examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon Kinesis.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

## Topics

- [Actions \(p. 3309\)](#)

## Actions

### Create a stream

The following code example shows how to create a Kinesis stream.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void createStream(KinesisClient kinesisClient, String streamName) {  
  
    try {  
        CreateStreamRequest streamReq = CreateStreamRequest.builder()  
            .streamName(streamName)  
            .shardCount(1)  
            .build();  
  
        kinesisClient.createStream(streamReq);  
  
    } catch (KinesisException e) {  
        System.err.println(e.getMessage());  
        System.exit(1);  
    }  
}
```

- For API details, see [CreateStream](#) in *AWS SDK for Java 2.x API Reference*.

### Delete a stream

The following code example shows how to delete a Kinesis stream.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void deleteStream(KinesisClient kinesisClient, String streamName) {  
  
    try {  
        DeleteStreamRequest delStream = DeleteStreamRequest.builder()  
            .streamName(streamName)  
            .build();  
  
        kinesisClient.deleteStream(delStream);  
  
    } catch (KinesisException e) {  
        System.err.println(e.getMessage());  
        System.exit(1);  
    }  
}
```

- For API details, see [DeleteStream](#) in *AWS SDK for Java 2.x API Reference*.

## Get data in batches from a stream

The following code example shows how to get data in batches from a Kinesis stream.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void getStockTrades(KinesisClient kinesisClient, String streamName) {  
  
    String shardIterator;  
    String lastShardId = null;  
  
    // Retrieve the Shards from a Stream  
    DescribeStreamRequest describeStreamRequest = DescribeStreamRequest.builder()  
        .streamName(streamName)  
        .build();  
  
    List<Shard> shards = new ArrayList<>();  
    DescribeStreamResponse streamRes;  
    do {  
        streamRes = kinesisClient.describeStream(describeStreamRequest);  
        shards.addAll(streamRes.streamDescription().shards());  
  
        if (shards.size() > 0) {  
            lastShardId = shards.get(shards.size() - 1).shardId();  
        }  
    } while (streamRes.streamDescription().hasMoreShards());  
  
    GetShardIteratorRequest itReq = GetShardIteratorRequest.builder()  
        .streamName(streamName)  
        .shardIteratorType("TRIM_HORIZON")  
        .shardId(lastShardId)  
        .build();  
  
    GetShardIteratorResponse shardIteratorResult =  
    kinesisClient.getShardIterator(itReq);  
    shardIterator = shardIteratorResult.shardIterator();  
  
    // Continuously read data records from shard.  
    List<Record> records;  
  
    // Create new GetRecordsRequest with existing shardIterator.  
    // Set maximum records to return to 1000.  
    GetRecordsRequest recordsRequest = GetRecordsRequest.builder()  
        .shardIterator(shardIterator)  
        .limit(1000)  
        .build();  
  
    GetRecordsResponse result = kinesisClient.getRecords(recordsRequest);  
  
    // Put result into record list. Result may be empty.  
    records = result.records();  
  
    // Print records  
    for (Record record : records) {  
        SdkBytes byteBuffer = record.data();  
    }  
}
```

```
        System.out.printf("Seq No: %s - %s%n", record.sequenceNumber(), new
String(byteBuffer.asarray()));

- [Scenarios \(p. 3314\)](#)

## Actions

### Create a function

The following code example shows how to create a Lambda function.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void createLambdaFunction(LambdaClient awsLambda,
                                         String functionName,
                                         String filePath,
                                         String role,
                                         String handler) {

    try {
        LambdaWaiter waiter = awsLambda.waiter();
        InputStream is = new FileInputStream(filePath);
        SdkBytes fileToUpload = SdkBytes.fromInputStream(is);

        FunctionCode code = FunctionCode.builder()
            .zipFile(fileToUpload)
            .build();

        CreateFunctionRequest functionRequest = CreateFunctionRequest.builder()
            .functionName(functionName)
            .description("Created by the Lambda Java API")
            .code(code)
            .handler(handler)
            .runtime(Runtime.JAVA8)
            .role(role)
            .build();

        // Create a Lambda function using a waiter.
        CreateFunctionResponse functionResponse =
awsLambda.createFunction(functionRequest);
        GetFunctionRequest getFunctionRequest = GetFunctionRequest.builder()
            .functionName(functionName)
            .build();
        WaiterResponse<GetFunctionResponse> waiterResponse =
waiter.waitUntilFunctionExists(getFunctionRequest);
        waiterResponse.matched().response().ifPresent(System.out::println);
        System.out.println("The function ARN is " +
functionResponse.functionArn());

    } catch(LambdaException | FileNotFoundException e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
}
```

- For API details, see [CreateFunction](#) in *AWS SDK for Java 2.x API Reference*.

## Delete a function

The following code example shows how to delete a Lambda function.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void deleteLambdaFunction(LambdaClient awsLambda, String
functionName) {
    try {
        DeleteFunctionRequest request = DeleteFunctionRequest.builder()
            .functionName(functionName)
            .build();
```

```
        awsLambda.deleteFunction(request);
        System.out.println("The "+functionName +" function was deleted");

    } catch(LambdaException e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
}
```

- For API details, see [DeleteFunction](#) in *AWS SDK for Java 2.x API Reference*.

## Invoke a function

The following code example shows how to invoke a Lambda function.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void invokeFunction(LambdaClient awsLambda, String functionName) {

    InvokeResponse res = null ;
    try {
        // Need a SdkBytes instance for the payload.
        JSONObject jsonObj = new JSONObject();
        jsonObj.put("inputValue", "2000");
        String json = jsonObj.toString();
        SdkBytes payload = SdkBytes.fromUtf8String(json) ;

        // Setup an InvokeRequest.
        InvokeRequest request = InvokeRequest.builder()
            .functionName(functionName)
            .payload(payload)
            .build();

        res = awsLambda.invoke(request);
        String value = res.payload().asUtf8String() ;
        System.out.println(value);

    } catch(LambdaException e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
}
```

- For API details, see [Invoke](#) in *AWS SDK for Java 2.x API Reference*.

## Scenarios

### Get started with functions

The following code example shows how to:

- Create an AWS Identity and Access Management (IAM) role that grants Lambda permission to write to logs.

- Create a Lambda function and upload handler code.
- Invoke the function with a single parameter and get results.
- Update the function code and configure its Lambda environment with an environment variable.
- Invoke the function with new parameters and get results. Display the execution log that's returned from the invocation.
- List the functions for your account.
- Delete the IAM role and the Lambda function.

For more information, see [Create a Lambda function with the console](#).

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/*
 * Lambda function names appear as:
 *
 * arn:aws:lambda:us-west-2:335556666777:function:HelloFunction
 *
 * To find this value, look at the function in the AWS Management Console.
 *
 * Before running this Java code example, set up your development environment,
 * including your credentials.
 *
 * For more information, see this documentation topic:
 *
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html
 *
 * This example performs the following tasks:
 *
 * 1. Creates an AWS Lambda function.
 * 2. Gets a specific AWS Lambda function.
 * 3. Lists all Lambda functions.
 * 4. Invokes a Lambda function.
 * 5. Updates the Lambda function code and invokes it again.
 * 6. Updates a Lambda function's configuration value.
 * 7. Deletes a Lambda function.
 */

## Amazon Personalize examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon Personalize.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

## Amazon Personalize Events examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon Personalize Events.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3338\)](#)

## Actions

### Import real-time interaction event data

The following code example shows how to import real-time interaction event data into Amazon Personalize Events.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static int putItems(PersonalizeEventsClient personalizeEventsClient,
                           String datasetArn,
                           String item1Id,
                           String item1PropertyName,
                           String item1PropertyValue,
                           String item2Id,
                           String item2PropertyName,
                           String item2PropertyValue) {
```

```
int responseCode = 0;
ArrayList<Item> items = new ArrayList<>();

try {
    Item item1 = Item.builder()
        .itemId(item1Id)
        .properties(String.format("{\"%1$s\": \"%2$s\"}",
            item1PropertyName, item1PropertyValue))
        .build();

    items.add(item1);

    Item item2 = Item.builder()
        .itemId(item2Id)
        .properties(String.format("{\"%1$s\": \"%2$s\"}",
            item2PropertyName, item2PropertyValue))
        .build();

    items.add(item2);

## Amazon Personalize Runtime examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon Personalize Runtime.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3340\)](#)

## Actions

### Get recommendations (custom dataset group)

The following code example shows how to get Amazon Personalize Runtime ranked recommendations.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static List<PredictedItem> getRankedRecs(PersonalizeRuntimeClient  
personalizeRuntimeClient,  
                                                String campaignArn,  
                                                String userId,  
                                                ArrayList<String> items) {  
  
    try {  
        GetPersonalizedRankingRequest rankingRecommendationsRequest =  
GetPersonalizedRankingRequest.builder()  
            .campaignArn(campaignArn)  
            .userId(userId)  
            .inputList(items)  
            .build();  
  
        GetPersonalizedRankingResponse recommendationsResponse =  
personalizeRuntimeClient.getPersonalizedRanking(rankingRecommendationsRequest);  
        List<PredictedItem> rankedItems =  
recommendationsResponse.personalizedRanking();  
        int rank = 1;  
        for (PredictedItem item : rankedItems) {  
            System.out.println("Item ranked at position " + rank + " details");  
            System.out.println("Item Id is : " + item.itemId());  
            System.out.println("Item score is : " + item.score());  
            System.out.println("-----");  
            rank++;  
        }  
        return rankedItems;  
    } catch (PersonalizeRuntimeException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
    return null;  
}
```

- For API details, see [GetPersonalizedRanking](#) in *AWS SDK for Java 2.x API Reference*.

## Get recommendations from a recommender (domain dataset group)

The following code example shows how to get Amazon Personalize Runtime Runtime recommendations.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Get a list of recommended items.

```
public static void getRecs(PersonalizeRuntimeClient personalizeRuntimeClient,  
String campaignArn, String userId){  
  
    try {  
        GetRecommendationsRequest recommendationsRequest =  
GetRecommendationsRequest.builder()  
            .campaignArn(campaignArn)  
            .numResults(20)  
            .userId(userId)  
            .build();  
    }
```

```

        GetRecommendationsResponse recommendationsResponse =
personalizeRuntimeClient.getRecommendations(recommendationsRequest);
        List<PredictedItem> items = recommendationsResponse.itemList();
        for (PredictedItem item: items) {
            System.out.println("Item Id is : "+item.itemId());
            System.out.println("Item score is : "+item.score());
        }
    } catch (AwsServiceException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}

```

Get a list of recommended items from a recommender created in a domain dataset group.

```

public static void getRecs(PersonalizeRuntimeClient personalizeRuntimeClient,
String recommenderArn, String userId){

    try {
        GetRecommendationsRequest recommendationsRequest =
GetRecommendationsRequest.builder()
        .recommenderArn(recommenderArn)
        .numResults(20)
        .userId(userId)
        .build();

        GetRecommendationsResponse recommendationsResponse =
personalizeRuntimeClient.getRecommendations(recommendationsRequest);
        List<PredictedItem> items = recommendationsResponse.itemList();

        for (PredictedItem item: items) {
            System.out.println("Item Id is : "+item.itemId());
            System.out.println("Item score is : "+item.score());
        }
    } catch (AwsServiceException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}

```

Use a filter when requesting recommendations.

```

public static void getFilteredRecs(PersonalizeRuntimeClient
personalizeRuntimeClient,
                                         String campaignArn,
                                         String userId,
                                         String filterArn,
                                         String parameter1Name,
                                         String parameter1Value1,
                                         String parameter1Value2,
                                         String parameter2Name,
                                         String parameter2Value){

    try {

        Map<String, String> filterValues = new HashMap<>();

        filterValues.put(parameter1Name, String.format("\"%1$s\", \"%2$s\"",
parameter1Value1, parameter1Value2));
        filterValues.put(parameter2Name, String.format("\"%1$s\"",

```

```
        parameter2Value));  
  
        GetRecommendationsRequest recommendationsRequest =  
GetRecommendationsRequest.builder()  
            .campaignArn(campaignArn)  
            .numResults(20)  
            .userId(userId)  
            .filterArn(filterArn)  
            .filterValues(filterValues)  
            .build();  
  
        GetRecommendationsResponse recommendationsResponse =  
personalizeRuntimeClient.getRecommendations(recommendationsRequest);  
        List<PredictedItem> items = recommendationsResponse.itemList();  
  
        for (PredictedItem item: items) {  
            System.out.println("Item Id is : "+item.itemId());  
            System.out.println("Item score is : "+item.score());  
        }  
    } catch (PersonalizeRuntimeException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
}
```

- For API details, see [GetRecommendations](#) in *AWS SDK for Java 2.x API Reference*.

## Amazon Pinpoint examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon Pinpoint.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

## Actions

### Create a campaign

The following code example shows how to create a campaign.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a campaign.

```
public static void createPinCampaign(PinpointClient pinpoint, String appId, String  
segmentId) {  
    CampaignResponse result = createCampaign(pinpoint, appId, segmentId);  
    System.out.println("Campaign " + result.name() + " created.");  
    System.out.println(result.description());  
}
```

```
public static CampaignResponse createCampaign(PinpointClient client, String appID,
String segmentID) {

    try {
        Schedule schedule = Schedule.builder()
            .startTime("IMMEDIATE")
            .build();

        Message defaultMessage = Message.builder()
            .action(Action.OPEN_APP)
            .body("My message body.")
            .title("My message title.")
            .build();

        MessageConfiguration messageConfiguration = MessageConfiguration.builder()
            .defaultMessage(defaultMessage)
            .build();

        WriteCampaignRequest request = WriteCampaignRequest.builder()
            .description("My description")
            .schedule(schedule)
            .name("MyCampaign")
            .segmentId(segmentID)
            .messageConfiguration(messageConfiguration)
            .build();

        CreateCampaignResponse result =
client.createCampaign(CreateCampaignRequest.builder()
                    .applicationId(appID)
                    .writeCampaignRequest(request).build()
);
        System.out.println("Campaign ID: " + result.campaignResponse().id());
        return result.campaignResponse();

    } catch (PinpointException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }

    return null;
}
```

- For API details, see [CreateCampaign in AWS SDK for Java 2.x API Reference](#).

## Create a segment

The following code example shows how to create a segment.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static SegmentResponse createSegment(PinpointClient client, String appId) {

    try {
        Map<String, AttributeDimension> segmentAttributes = new HashMap<>();
        segmentAttributes.put("Team", AttributeDimension.builder()
            .attributeType(AttributeType.INCLUSIVE)
```

```
.values("Lakers")
.build();

RecencyDimension recencyDimension = RecencyDimension.builder()
.duration("DAY_30")
.recencyType("ACTIVE")
.build();

SegmentBehaviors segmentBehaviors = SegmentBehaviors.builder()
.recency(recencyDimension)
.build();

SegmentDemographics segmentDemographics = SegmentDemographics
.builder()
.build();

SegmentLocation segmentLocation = SegmentLocation
.builder()
.build();

SegmentDimensions dimensions = SegmentDimensions
.builder()
.attributes(segmentAttributes)
.behavior(segmentBehaviors)
.demographic(segmentDemographics)
.location(segmentLocation)
.build();

WriteSegmentRequest writeSegmentRequest = WriteSegmentRequest.builder()
.name("MySegment")
.dimensions(dimensions)
.build();

CreateSegmentRequest createSegmentRequest = CreateSegmentRequest.builder()
.applicationId(appId)
.writeSegmentRequest(writeSegmentRequest)
.build();

CreateSegmentResponse createSegmentResult =
client.createSegment(createSegmentRequest);
System.out.println("Segment ID: " +
createSegmentResult.segmentResponse().id());
System.out.println("Done");
return createSegmentResult.segmentResponse();

} catch (PinpointException e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}
return null;
}
```

- For API details, see [CreateSegment in AWS SDK for Java 2.x API Reference](#).

## Create an application

The following code example shows how to create an application.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String createApplication(PinpointClient pinpoint, String appName) {  
  
    try {  
        CreateApplicationRequest appRequest = CreateApplicationRequest.builder()  
            .name(appName)  
            .build();  
  
        CreateAppRequest request = CreateAppRequest.builder()  
            .createApplicationRequest(appRequest)  
            .build();  
  
        CreateAppResponse result = pinpoint.createApp(request);  
        return result.applicationResponse().id();  
  
    } catch (PinpointException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
    return "";  
}
```

- For API details, see [CreateApp](#) in *AWS SDK for Java 2.x API Reference*.

## Delete an application

The following code example shows how to delete an application.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Delete an application.

```
public static void deletePinApp(PinpointClient pinpoint, String appId ) {  
  
    try {  
        DeleteAppRequest appRequest = DeleteAppRequest.builder()  
            .applicationId(appId)  
            .build();  
  
        DeleteAppResponse result = pinpoint.deleteApp(appRequest);  
        String appName = result.applicationResponse().name();  
        System.out.println("Application " + appName + " has been deleted.");  
  
    } catch (PinpointException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
}
```

- For API details, see [DeleteApp](#) in *AWS SDK for Java 2.x API Reference*.

## Delete an endpoint

The following code example shows how to delete an endpoint.

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Delete an endpoint.

```
public static void deletePinEncpoint(PinpointClient pinpoint, String appId, String endpointId) {  
  
    try {  
        DeleteEndpointRequest appRequest = DeleteEndpointRequest.builder()  
            .applicationId(appId)  
            .endpointId(endpointId)  
            .build();  
  
        DeleteEndpointResponse result = pinpoint.deleteEndpoint(appRequest);  
        String id = result.endpointResponse().id();  
        System.out.println("The deleted endpoint id " + id);  
  
    } catch (PinpointException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
    System.out.println("Done");  
}
```

- For API details, see [DeleteEndpoint](#) in *AWS SDK for Java 2.x API Reference*.

## Export an endpoint

The following code example shows how to export an endpoint.

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Export an endpoint.

```
public static void exportAllEndpoints(PinpointClient pinpoint,  
                                     S3Client s3Client,

## Get endpoints

The following code example shows how to get endpoints.

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void lookupPinpointEndpoint(PinpointClient pinpoint, String appId,
String endpoint) {

    try {
        GetEndpointRequest appRequest = GetEndpointRequest.builder()
            .applicationId(appId)
            .endpointId(endpoint)
            .build();

        GetEndpointResponse result = pinpoint.getEndpoint(appRequest);
        EndpointResponse endResponse = result.endpointResponse();

        // Uses the Google Gson library to pretty print the endpoint JSON.
        Gson gson = new GsonBuilder()
            .setFieldNamingPolicy(FieldNamingPolicy.UPPER_CAMEL_CASE)
            .setPrettyPrinting()
            .create();

        String endpointJson = gson.toJson(endResponse);
        System.out.println(endpointJson);

    } catch (PinpointException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
    System.out.println("Done");
}
```

- For API details, see [GetEndpoint](#) in *AWS SDK for Java 2.x API Reference*.

## Import a segment

The following code example shows how to import a segment.

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Import a segment.

```
public static ImportJobResponse createImportSegment(PinpointClient client,
                                                    String appId,
                                                    String bucket,
                                                    String key,
                                                    String roleArn) {

## List segments

The following code example shows how to list segments.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

List segments.

```
public static void listSegs( PinpointClient pinpoint, String appId) {  
  
    try {  
        GetSegmentsRequest request = GetSegmentsRequest.builder()  
            .applicationId(appId)  
            .build();  
  
        GetSegmentsResponse response = pinpoint.getSegments(request);  
        List<SegmentResponse> segments = response.segmentsResponse().item();  
        for(SegmentResponse segment: segments) {  
            System.out.println("Segment " + segment.id() + " " + segment.name() +  
" " + segment.lastModifiedDate());  
        }  
  
    } catch ( PinpointException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
}
```

- For API details, see [GetSegments](#) in *AWS SDK for Java 2.x API Reference*.

## Send email and text messages

The following code example shows how to send email and text messages with Amazon Pinpoint.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Send an email message.

```
public static void sendEmail(PinpointClient pinpoint,  
                            String subject,  
                            String appId,  
                            String senderAddress,  
                            String toAddress) {  
  
    try {  
        Map<String,AddressConfiguration> addressMap = new HashMap<>();  
        AddressConfiguration configuration = AddressConfiguration.builder()  
            .channelType(ChannelType.EMAIL)  
            .build();  
  
        addressMap.put(toAddress, configuration);  
        SimpleEmailPart emailPart = SimpleEmailPart.builder()  
            .data(htmlBody)
```

```
.charset(charset)
.build() ;

SimpleEmailPart subjectPart = SimpleEmailPart.builder()
.data(subject)
.charset(charset)
.build() ;

SimpleEmail simpleEmail = SimpleEmail.builder()
.htmlPart(emailPart)
.subject(subjectPart)
.build();

EmailMessage emailMessage = EmailMessage.builder()
.body(htmlBody)
.fromAddress(senderAddress)
.simpleEmail(simpleEmail)
.build();

DirectMessageConfiguration directMessageConfiguration =
DirectMessageConfiguration.builder()
.emailMessage(emailMessage)
.build();

MessageRequest messageRequest = MessageRequest.builder()
.addresses(addressMap)
.messageConfiguration(directMessageConfiguration)
.build();

SendMessagesRequest messagesRequest = SendMessagesRequest.builder()
.applicationId(appId)
.messageRequest(messageRequest)
.build();

pinpoint.sendMessages(messagesRequest);

} catch (PinpointException e) {
System.err.println(e.awsErrorDetails().errorMessage());
System.exit(1);
}
}
```

Send an SMS message.

```
public static void sendSMSMessage(PinpointClient pinpoint, String message, String
appId, String originationNumber, String destinationNumber) {

try {
Map<String, AddressConfiguration> addressMap = new HashMap<String,
AddressConfiguration>();
AddressConfiguration addConfig = AddressConfiguration.builder()
.channelType(ChannelType.SMS)
.build();

addressMap.put(destinationNumber, addConfig);
SMSMessage smsMessage = SMSMessage.builder()
.body(message)
.messageType(messageType)
.originationNumber(originationNumber)
.senderId(senderId)
.keyword(registeredKeyword)
.build();

// Create a DirectMessageConfiguration object.
```

```
DirectMessageConfiguration direct = DirectMessageConfiguration.builder()  
.smsMessage(smsMessage)  
.build();  
  
MessageRequest msgReq = MessageRequest.builder()  
.addresses(addressMap)  
.messageConfiguration(direct)  
.build();  
  
// create a SendMessagesRequest object  
SendMessagesRequest request = SendMessagesRequest.builder()  
.applicationId(appId)  
.messageRequest(msgReq)  
.build();  
  
SendMessagesResponse response= pinpoint.sendMessages(request);  
MessageResponse msg1 = response.messageResponse();  
Map map1 = msg1.result();  
  
//Write out the result of sendMessage.  
map1.forEach((k, v) -> System.out.println((k + ":" + v)));  
  
} catch (PinpointException e) {  
    System.err.println(e.awsErrorDetails().errorMessage());  
    System.exit(1);  
}  
}
```

#### Send batch SMS messages.

```
public static void sendSMSMessage(PinpointClient pinpoint, String message, String  
appId, String originationNumber, String destinationNumber, String destinationNumber1)  
{  
    try {  
        Map<String, AddressConfiguration> addressMap = new HashMap<String,  
AddressConfiguration>();  
        AddressConfiguration addConfig = AddressConfiguration.builder()  
.channelType(ChannelType.SMS)  
.build();  
  
        // Add an entry to the Map object for each number to whom you want to send  
a message.  
        addressMap.put(destinationNumber, addConfig);  
        addressMap.put(destinationNumber1, addConfig);  
        SMSMessage smsMessage = SMSMessage.builder()  
.body(message)  
.messageType(messageType)  
.originationNumber(originationNumber)  
.senderId(senderId)  
.keyword(registeredKeyword)  
.build();  
  
        // Create a DirectMessageConfiguration object.  
        DirectMessageConfiguration direct = DirectMessageConfiguration.builder()  
.smsMessage(smsMessage)  
.build();  
  
        MessageRequest msgReq = MessageRequest.builder()  
.addresses(addressMap)  
.messageConfiguration(direct)  
.build();  
  
        // Create a SendMessagesRequest object.  
        SendMessagesRequest request = SendMessagesRequest.builder()
```

```
.applicationId(appId)
.messageRequest(msgReq)
.build();

SendMessagesResponse response= pinpoint.sendMessages(request);
MessageResponse msg1 = response.messageResponse();
Map map1 = msg1.result();

// Write out the result of sendMessage.
map1.forEach((k, v) -> System.out.println((k + ":" + v)));

} catch (PinpointException e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}
}
```

- For API details, see [SendMessages](#) in *AWS SDK for Java 2.x API Reference*.

## Update an endpoint

The following code example shows how to update an endpoint.

### Create a DB instance

The following code example shows how to create an Amazon RDS DB instance and wait for it to become available.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void createSnapshot(RdsClient rdsClient, String dbInstanceIdentifier,
String dbSnapshotIdentifier) {

    try {
        CreateDbSnapshotRequest snapshotRequest = CreateDbSnapshotRequest.builder()
            .dbInstanceIdentifier(dbInstanceIdentifier)
            .dbSnapshotIdentifier(dbSnapshotIdentifier)
            .build();

        CreateDbSnapshotResponse response =
rdsClient.createDBSnapshot(snapshotRequest);
        System.out.print("The Snapshot id is " +
response.dbSnapshot().dbiResourceId());

    } catch (RdsException e) {
        System.out.println(e.getLocalizedMessage());
        System.exit(1);
    }
}
```

- For API details, see [CreateDBInstance](#) in *AWS SDK for Java 2.x API Reference*.

### Create a DB parameter group

The following code example shows how to create an Amazon RDS DB parameter group.

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void createDBParameterGroup(RdsClient rdsClient, String dbGroupName,
String dbParameterGroupFamily) {
    try {
        CreateDbParameterGroupRequest groupRequest =
CreateDbParameterGroupRequest.builder()
        .dbParameterGroupName(dbGroupName)
        .dbParameterGroupFamily(dbParameterGroupFamily)
        .description("Created by using the AWS SDK for Java")
        .build();

        CreateDbParameterGroupResponse response =
rdsClient.createDBParameterGroup(groupRequest);
        System.out.println("The group name is " +
response.dbParameterGroup().dbParameterGroupName());

    } catch (RdsException e) {
        System.out.println(e.getLocalizedMessage());
        System.exit(1);
    }
}
```

- For API details, see [CreateDBParameterGroup](#) in *AWS SDK for Java 2.x API Reference*.

## Create a snapshot of a DB instance

The following code example shows how to create a snapshot of an Amazon RDS DB instance.

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Create an Amazon RDS snapshot.
public static void createSnapshot(RdsClient rdsClient, String dbInstanceIdentifier,
String dbSnapshotIdentifier) {
    try {
        CreateDbSnapshotRequest snapshotRequest = CreateDbSnapshotRequest.builder()
            .dbInstanceIdentifier(dbInstanceIdentifier)
            .dbSnapshotIdentifier(dbSnapshotIdentifier)
            .build();

        CreateDbSnapshotResponse response =
rdsClient.createDBSnapshot(snapshotRequest);
        System.out.println("The Snapshot id is " +
response.dbSnapshot().dbiResourceId());

    } catch (RdsException e) {
        System.out.println(e.getLocalizedMessage());
        System.exit(1);
    }
}
```

- For API details, see [CreateDBSnapshot](#) in *AWS SDK for Java 2.x API Reference*.

## Delete a DB instance

## Describe options for DB instances

The following code example shows how to describe options for Amazon RDS DB instances.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Get a list of allowed engine versions.
public static void getAllowedEngines(RdsClient rdsClient, String
dbParameterGroupFamily) {
    try {
        DescribeDbEngineVersionsRequest versionsRequest =
DescribeDbEngineVersionsRequest.builder()
        .dbParameterGroupFamily(dbParameterGroupFamily)
        .engine("mysql")
        .build();

        DescribeDbEngineVersionsResponse response =
rdsClient.describeDBEngineVersions(versionsRequest);
        List<DBEngineVersion> dbEngines = response.dbEngineVersions();
        for (DBEngineVersion dbEngine: dbEngines) {
            System.out.println("The engine version is " +dbEngine.engineVersion());
            System.out.println("The engine description is "
+dbEngine.dbEngineDescription());
        }

    } catch (RdsException e) {
        System.out.println(e.getLocalizedMessage());
        System.exit(1);
    }
}
```

- For API details, see [DescribeOrderableDBInstanceState](#) in *AWS SDK for Java 2.x API Reference*.

## Describe parameters in a DB parameter group

The following code example shows how to describe parameters in an Amazon RDS DB parameter group.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Retrieve parameters in the group.
public static void describeDbParameters(RdsClient rdsClient, String dbGroupName, int
flag) {
    try {
        DescribeDbParametersRequest dbParameterGroupsRequest;
        if (flag == 0) {
            dbParameterGroupsRequest = DescribeDbParametersRequest.builder()
                .dbParameterGroupName(dbGroupName)
                .build();
        } else {
            dbParameterGroupsRequest = DescribeDbParametersRequest.builder()
                .dbParameterGroupName(dbGroupName)
                .source("user")
                .build();
        }

        DescribeDbParametersResponse response =
rdsClient.describeDBParameters(dbParameterGroupsRequest);
        List<Parameter> dbParameters = response.parameters();
        String paraName;
        for (Parameter para: dbParameters) {
            // Only print out information about either auto_increment_offset or
auto_increment_increment.
            paraName = para.parameterName();
            if ( (paraName.compareTo("auto_increment_offset") ==0) ||
(paraName.compareTo("auto_increment_increment ") ==0)) {
                System.out.println("**** The parameter name is " + paraName);
                System.out.println("**** The parameter value is " +
para.parameterValue());
                System.out.println("**** The parameter data type is " +
para.dataType());
                System.out.println("**** The parameter description is " +
para.description());
                System.out.println("**** The parameter allowed values is " +
para.allowedValues());
            }
        }

    } catch (RdsException e) {
        System.out.println(e.getLocalizedMessage());
        System.exit(1);
    }
}
```

- For API details, see [DescribeDBParameters](#) in *AWS SDK for Java 2.x API Reference*.

## Modify a DB instance

The following code example shows how to modify an Amazon RDS DB instance.

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void updateInstance(RdsClient rdsClient, String dbInstanceIdentifier,
String masterUserPassword) {

    try {
        // For a demo - modify the DB instance by modifying the master password.
        ModifyDbInstanceRequest modifyDbInstanceRequest =
ModifyDbInstanceRequest.builder()
            .dbInstanceIdentifier(dbInstanceIdentifier)
            .publiclyAccessible(true)
            .masterUserPassword(masterUserPassword)
            .build();

        ModifyDbInstanceResponse instanceResponse =
rdsClient.modifyDBInstance(modifyDbInstanceRequest);
        System.out.print("The ARN of the modified database is: "
+instanceResponse.dbInstance().dbInstanceArn());

    } catch (RdsException e) {
        System.out.println(e.getLocalizedMessage());
        System.exit(1);
    }
}
```

- For API details, see [ModifyDBInstance](#) in *AWS SDK for Java 2.x API Reference*.

## Reboot a DB instance

The following code example shows how to reboot an Amazon RDS DB instance.

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void rebootInstance(RdsClient rdsClient, String
dbInstanceIdentifier ) {

    try {
        RebootDbInstanceRequest rebootDbInstanceRequest =
RebootDbInstanceRequest.builder()
            .dbInstanceIdentifier(dbInstanceIdentifier)
            .build();

        RebootDbInstanceResponse instanceResponse =
rdsClient.rebootDBInstance(rebootDbInstanceRequest);
        System.out.print("The database " +
instanceResponse.dbInstance().dbInstanceArn() +" was rebooted");

    } catch (RdsException e) {
        System.out.println(e.getLocalizedMessage());
        System.exit(1);
    }
}
```

- For API details, see [RebootDBInstance](#) in *AWS SDK for Java 2.x API Reference*.

## Retrieve attributes

The following code example shows how to retrieve attributes that belong to an Amazon RDS account.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void getAccountAttributes(RdsClient rdsClient) {  
  
    try {  
        DescribeAccountAttributesResponse response =  
rdsClient.describeAccountAttributes();  
        List<AccountQuota> quotasList = response.accountQuotas();  
        for (AccountQuota quotas: quotasList) {  
            System.out.println("Name is: " +quotas.accountQuotaName());  
            System.out.println("Max value is " +quotas.max());  
        }  
  
    } catch (RdsException e) {  
        System.out.println(e.getLocalizedMessage());  
        System.exit(1);  
    }  
}
```

- For API details, see [DescribeAccountAttributes](#) in *AWS SDK for Java 2.x API Reference*.

## Update parameters in a DB parameter group

The following code example shows how to update parameters in an Amazon RDS DB parameter group.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Modify auto_increment_offset and auto_increment_increment parameters.  
public static void modifyDBParas(RdsClient rdsClient, String dbGroupName) {  
    try {  
        Parameter parameter1 = Parameter.builder()  
            .parameterName("auto_increment_offset")  
            .applyMethod("immediate")  
            .parameterValue("5")  
            .build();  
  
        List<Parameter> paraList = new ArrayList<>();  
        paraList.add(parameter1);  
        ModifyDbParameterGroupRequest groupRequest =  
ModifyDbParameterGroupRequest.builder()  
            .dBParameterGroupName(dbGroupName)  
            .parameters(paraList)  
            .build();
```

```
        ModifyDbParameterGroupResponse response =
rdsClient.modifyDBParameterGroup(groupRequest);
System.out.println("The parameter group "+ response.dbParameterGroupName()
+" was successfully modified");

    } catch (RdsException e) {
        System.out.println(e.getLocalizedMessage());
        System.exit(1);
    }
}
```

- For API details, see [ModifyDBParameterGroup](#) in *AWS SDK for Java 2.x API Reference*.

## Scenarios

### Get started with DB instances

The following code example shows how to:

- Create a custom DB parameter group and set parameter values.
- Create a DB instance that's configured to use the parameter group. The DB instance also contains a database.
- Take a snapshot of the instance.
- Delete the instance and parameter group.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Run multiple operations.

```
/**
 * Before running this Java (v2) code example, set up your development environment,
 * including your credentials.
 *
 * For more information, see the following documentation topic:
 *
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html
 *
 * This Java example performs the following tasks:
 *
 * 1. Returns a list of the available DB engines.
 * 2. Selects an engine family and create a custom DB parameter group.
 * 3. Gets the parameter groups.
 * 4. Gets parameters in the group.
 * 5. Modifies the auto_increment_offset parameter.
 * 6. Gets and displays the updated parameters.
 * 7. Gets a list of allowed engine versions.
 * 8. Gets a list of micro instance classes available for the selected engine.
 * 9. Creates an RDS database instance that contains a MySQL database and uses the
 *    parameter group.
 * 10. Waits for the DB instance to be ready and prints out the connection endpoint
 *     value.
 * 11. Creates a snapshot of the DB instance.
 * 12. Waits for an RDS DB snapshot to be ready.
 * 13. Deletes the RDS DB instance.
```

```
* 14. Deletes the parameter group.  
*/

## Amazon Redshift examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon Redshift.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3377\)](#)

## Actions

### Create a cluster

The following code example shows how to create an Amazon Redshift cluster.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the cluster.

```
public static void createCluster(RedshiftClient redshiftClient, String clusterId,
String masterUsername, String masterUserPassword ) {

    try {
        CreateClusterRequest clusterRequest = CreateClusterRequest.builder()
            .clusterIdentifier(clusterId)
            .masterUsername(masterUsername) // set the user name here
            .masterUserPassword(masterUserPassword) // set the user password here
            .nodeType("ds2.xlarge")
            .publiclyAccessible(true)
            .numberOfNodes(2)
            .build();

        CreateClusterResponse clusterResponse =
redshiftClient.createCluster(clusterRequest);
        System.out.println("Created cluster " +
clusterResponse.cluster().clusterIdentifier());
    }
}
```

```
        } catch (RedshiftException e) {
            System.err.println(e.getMessage());
            System.exit(1);
    }
```

- For API details, see [CreateCluster](#) in *AWS SDK for Java 2.x API Reference*.

## Delete a cluster

The following code example shows how to delete an Amazon Redshift cluster.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Delete the cluster.

```
public static void deleteRedshiftCluster(RedshiftClient redshiftClient, String
clusterId) {

    try {
        DeleteClusterRequest deleteClusterRequest = DeleteClusterRequest.builder()
            .clusterIdentifier(clusterId)
            .skipFinalClusterSnapshot(true)
            .build();

        DeleteClusterResponse response =
redshiftClient.deleteCluster(deleteClusterRequest);
        System.out.println("The status is "+response.cluster().clusterStatus());

    } catch (RedshiftException e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
}
```

- For API details, see [DeleteCluster](#) in *AWS SDK for Java 2.x API Reference*.

## Describe your clusters

The following code example shows how to describe your Amazon Redshift clusters.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Describe the cluster.

```
public static void describeRedshiftClusters(RedshiftClient redshiftClient) {

    try {
        DescribeClustersResponse clusterResponse =
redshiftClient.describeClusters();
```

```
        List<Cluster> clusterList = clusterResponse.clusters();
        for (Cluster cluster: clusterList) {
            System.out.println("Cluster database name is: "+cluster.dbName());
            System.out.println("Cluster status is: "+cluster.clusterStatus());
        }

    } catch (RedshiftException e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
}
```

- For API details, see [DescribeClusters in AWS SDK for Java 2.x API Reference](#).

## Modify a cluster

The following code example shows how to modify an Amazon Redshift cluster.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Modify a cluster.

```
public static void modifyCluster(RedshiftClient redshiftClient, String clusterId) {

    try {
        ModifyClusterRequest modifyClusterRequest = ModifyClusterRequest.builder()
            .clusterIdentifier(clusterId)
            .preferredMaintenanceWindow("wed:07:30-wed:08:00")
            .build();

        ModifyClusterResponse clusterResponse =
        redshiftClient.modifyCluster(modifyClusterRequest);
        System.out.println("The modified cluster was successfully modified and
has "+ clusterResponse.cluster().preferredMaintenanceWindow() +" as the maintenance
window");

    } catch (RedshiftException e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
}
```

- For API details, see [ModifyCluster in AWS SDK for Java 2.x API Reference](#).

compareFacesResult.targetImageOrientationCorrection());
```

```
        } catch(RekognitionException | FileNotFoundException e) {
            System.out.println("Failed to load source image " + sourceImage);
            System.exit(1);
    }
}
```

- For API details, see [CompareFaces](#) in *AWS SDK for Java 2.x API Reference*.

## Create a collection

The following code example shows how to create an Amazon Rekognition collection.

For more information, see [Creating a collection](#).

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void createMyCollection(RekognitionClient rekClient, String
collectionId) {

    try {
        CreateCollectionRequest collectionRequest =
CreateCollectionRequest.builder()
            .collectionId(collectionId)
            .build();

        CreateCollectionResponse collectionResponse =
rekClient.createCollection(collectionRequest);
        System.out.println("CollectionArn: " + collectionResponse.collectionArn());
        System.out.println("Status code: " +
collectionResponse.statusCode().toString());

    } catch(RekognitionException e) {
        System.out.println(e.getMessage());
        System.exit(1);
    }
}
```

- For API details, see [CreateCollection](#) in *AWS SDK for Java 2.x API Reference*.

## Delete a collection

The following code example shows how to delete an Amazon Rekognition collection.

For more information, see [Deleting a collection](#).

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void deleteMyCollection(RekognitionClient rekClient, String
collectionId) {
```

```
try {
    DeleteCollectionRequest deleteCollectionRequest =
DeleteCollectionRequest.builder()
    .collectionId(collectionId)
    .build();

    DeleteCollectionResponse deleteCollectionResponse =
rekClient.deleteCollection(deleteCollectionRequest);
    System.out.println(collectionId + ":" +
deleteCollectionResponse.statusCode().toString());

} catch(RekognitionException e) {
    System.out.println(e.getMessage());
    System.exit(1);
}
}
```

- For API details, see [DeleteCollection in AWS SDK for Java 2.x API Reference](#).

## Delete faces from a collection

The following code example shows how to delete faces from an Amazon Rekognition collection.

For more information, see [Deleting faces from a collection](#).

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void deleteFacesCollection(RekognitionClient rekClient,
                                         String collectionId,
                                         String faceId) {

## Amazon S3 examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon Simple Storage Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3406\)](#)
- [Scenarios \(p. 3425\)](#)

## Actions

### Add CORS rules to a bucket

The following code example shows how to add cross-origin resource sharing (CORS) rules to an S3 bucket.

#### SDK for Java 2.x

## Delete the website configuration from a bucket

The following code example shows how to delete the website configuration from an S3 bucket.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void deleteBucketWebsiteConfig(S3Client s3, String bucketName) {

    DeleteBucketWebsiteRequest delReq = DeleteBucketWebsiteRequest.builder()
        .bucket(bucketName)
        .build();

    try {
        s3.deleteBucketWebsite(delReq);

    } catch (S3Exception e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.out.println("Failed to delete website configuration!");
        System.exit(1);
    }
}
```

- For API details, see [DeleteBucketWebsite](#) in *AWS SDK for Java 2.x API Reference*.

## Determine the existence and content type of an object

The following code example shows how to determine the existence and content type of an object in an S3 bucket.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void getContentType (S3Client s3, String bucketName, String keyName)
{
    try {
        HeadObjectRequest objectRequest = HeadObjectRequest.builder()
            .key(keyName)
            .bucket(bucketName)
```

```
.build();

HeadObjectResponse objectHead = s3.headObject(objectRequest);
String type = objectHead.contentType();
System.out.println("The object content type is "+type);

} catch (S3Exception e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}
}
```

- For API details, see [HeadObject](#) in *AWS SDK for Java 2.x API Reference*.

## Get an object from a bucket

The following code example shows how to read data from an object in an S3 bucket.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Read data as a byte array.

```
public static void getObjectBytes (S3Client s3, String bucketName, String keyName,
String path) {

    try {
        GetObjectRequest objectRequest = GetObjectRequest
            .builder()
            .key(keyName)
            .bucket(bucketName)
            .build();

        ResponseBytes<GetObjectResponse> objectBytes =
s3.getObjectAsBytes(objectRequest);
        byte[] data = objectBytes.asByteArray();

        // Write the data to a local file.
        File myFile = new File(path );
        OutputStream os = new FileOutputStream(myFile);
        os.write(data);
        System.out.println("Successfully obtained bytes from an S3 object");
        os.close();

    } catch (IOException ex) {
        ex.printStackTrace();
    } catch (S3Exception e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

Read tags that belong to an object.

```
public static void listTags(S3Client s3, String bucketName, String keyName) {

    try {
        GetObjectTaggingRequest getTaggingRequest = GetObjectTaggingRequest
```

```
.builder()  
.key(keyName)  
.bucket(bucketName)  
.build();  
  
GetObjectTaggingResponse tags = s3.getObjectTagging(getTaggingRequest);  
List<Tag> tagSet= tags.tagSet();  
for (Tag tag : tagSet) {  
    System.out.println(tag.key());  
    System.out.println(tag.value());  
}  
  
} catch (S3Exception e) {  
    System.err.println(e.awsErrorDetails().errorMessage());  
    System.exit(1);  
}  
}
```

#### Get a URL for an object.

```
public static void getURL(S3Client s3, String bucketName, String keyName ) {  
  
try {  
    GetUrlRequest request = GetUrlRequest.builder()  
        .bucket(bucketName)  
        .key(keyName)  
        .build();  
  
    URL url = s3.utilities().getUrl(request);  
    System.out.println("The URL for "+keyName +" is "+ url);  
  
} catch (S3Exception e) {  
    System.err.println(e.awsErrorDetails().errorMessage());  
    System.exit(1);  
}  
}
```

#### Get an object by using the S3Presigner client object.

```
public static void getPresignedUrl(S3Presigner presigner, String bucketName,  
String keyName ) {  
  
try {  
    GetObjectRequest getObjectRequest = GetObjectRequest.builder()  
        .bucket(bucketName)  
        .key(keyName)  
        .build();  
  
    GetObjectPresignRequest getObjectPresignRequest =  
GetObjectPresignRequest.builder()  
        .signatureDuration(Duration.ofMinutes(60))  
        .getObjectRequest(getObjectRequest)  
        .build();  
  
    PresignedGetObjectRequest presignedGetObjectRequest =  
presigner.presignGetObject(getObjectPresignRequest);  
    String theUrl = presignedGetObjectRequest.url().toString();  
    System.out.println("Presigned URL: " + theUrl);  
    HttpURLConnection connection = (HttpURLConnection)  
presignedGetObjectRequest.url().openConnection();  
    presignedGetObjectRequest.httpRequest().headers().forEach((header,  
values) -> {
```

```
        values.forEach(value -> {
            connection.addRequestProperty(header, value);
        });
    });

    // Send any request payload that the service needs (not needed when
    isBrowserExecutable is true).
    if (presignedGetObjectRequest.signedPayload().isPresent()) {
        connection.setDoOutput(true);

        try (InputStream signedPayload =
presignedGetObjectRequest.signedPayload().get().asInputStream();
            OutputStream httpOutputStream = connection.getOutputStream()) {
            IoUtils.copy(signedPayload, httpOutputStream);
        }
    }

    // Download the result of executing the request.
    try (InputStream content = connection.getInputStream()) {
        System.out.println("Service returned response: ");
        IoUtils.copy(content, System.out);
    }

} catch (S3Exception | IOException e) {
    e.printStackTrace();
}
}
```

- For API details, see [GetObject](#) in *AWS SDK for Java 2.x API Reference*.

## Get the ACL of a bucket

The following code example shows how to get the access control list (ACL) of an S3 bucket.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String getBucketACL(S3Client s3, String objectKey, String bucketName) {
    try {
        GetObjectAclRequest aclReq = GetObjectAclRequest.builder()
            .bucket(bucketName)
            .key(objectKey)
            .build();

        GetObjectAclResponse aclRes = s3.getObjectAcl(aclReq);
        List<Grant> grants = aclRes.grants();
        String grantee = "";
        for (Grant grant : grants) {
            System.out.format(" %s: %s\n", grant.grantee().id(),
grant.permission());
            grantee = grant.grantee().id();
        }

        return grantee;
    } catch (S3Exception e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

```
        }

    return "";
}
```

- For API details, see [GetBucketAcl](#) in *AWS SDK for Java 2.x API Reference*.

## Get the policy for a bucket

The following code example shows how to get the policy for an S3 bucket.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String getPolicy(S3Client s3, String bucketName) {

    String policyText;
    System.out.format("Getting policy for bucket: \"%s\"\n\n", bucketName);
    GetBucketPolicyRequest policyReq = GetBucketPolicyRequest.builder()
        .bucket(bucketName)
        .build();

    try {
        GetBucketPolicyResponse policyRes = s3.getBucketPolicy(policyReq);
        policyText = policyRes.policy();
        return policyText;
    } catch (S3Exception e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }

    return "";
}
```

- For API details, see [GetBucketPolicy](#) in *AWS SDK for Java 2.x API Reference*.

## List in-progress multipart uploads

The following code example shows how to list in-progress multipart uploads to an S3 bucket.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void listUploads( S3Client s3, String bucketName) {

    try {
        ListMultipartUploadsRequest listMultipartUploadsRequest =
ListMultipartUploadsRequest.builder()
        .bucket(bucketName)
        .build();
```

```
        ListMulticastUploadsResponse response =
s3.listMulticastUploads(listMulticastUploadsRequest);
        List<MulticastUpload> uploads = response.uploads();
        for (MulticastUpload upload: uploads) {
            System.out.println("Upload in progress: Key = \\" + upload.key() + "\","
id = " + upload.uploadId());
        }

    } catch (S3Exception e) {
    System.err.println(e.getMessage());
    System.exit(1);
}
}
```

- For API details, see [ListMulticastUploads](#) in *AWS SDK for Java 2.x API Reference*.

## List objects in a bucket

The following code example shows how to list objects in an S3 bucket.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void listBucketObjects(S3Client s3, String bucketName ) {

    try {
        ListObjectsRequest listObjects = ListObjectsRequest
            .builder()
            .bucket(bucketName)
            .build();

        ListObjectsResponse res = s3.listObjects(listObjects);
        List<S3Object> objects = res.contents();
        for (S3Object myValue : objects) {
            System.out.print("\n The name of the key is " + myValue.key());
            System.out.print("\n The object is " + calKb(myValue.size()) + " KBs");
            System.out.print("\n The owner is " + myValue.owner());
        }

    } catch (S3Exception e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}

//convert bytes to kbs.
private static long calKb(Long val) {
    return val/1024;
}
```

- For API details, see [ListObjects](#) in *AWS SDK for Java 2.x API Reference*.

## Restore an archived copy of an object

The following code example shows how to restore an archived copy of an object back into an S3 bucket.

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void restoreS3Object(S3Client s3, String bucketName, String keyName,
String expectedBucketOwner) {

    try {
        RestoreRequest restoreRequest = RestoreRequest.builder()
            .days(10)

        .glacierJobParameters(GlacierJobParameters.builder().tier(Tier.STANDARD).build())
            .build();

        RestoreObjectRequest objectRequest = RestoreObjectRequest.builder()
            .expectedBucketOwner(expectedBucketOwner)
            .bucket(bucketName)
            .key(keyName)
            .restoreRequest(restoreRequest)
            .build();

        s3.restoreObject(objectRequest);

    } catch (S3Exception e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [RestoreObject](#) in *AWS SDK for Java 2.x API Reference*.

## Set a new ACL for a bucket

The following code example shows how to set a new access control list (ACL) for an S3 bucket.

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void setBucketAcl(S3Client s3, String bucketName, String id) {

    try {
        Grant ownerGrant = Grant.builder()
            .grantee(builder -> builder.id(id))
            .type(Type.CANONICAL_USER)
            .permission(Permission.FULL_CONTROL)
            .build();

        List<Grant> grantList2 = new ArrayList<>();
        grantList2.add(ownerGrant);

        AccessControlPolicy acl = AccessControlPolicy.builder()
            .owner(builder -> builder.id(id))
            .grants(grantList2)
            .build();

        PutBucketAclRequest putAclReq = PutBucketAclRequest.builder()
```

```
.bucket(bucketName)
.accessControlPolicy(acl)
.build();

s3.putBucketAcl(putAclReq);

} catch (S3Exception e) {
    e.printStackTrace();
    System.exit(1);
}
}
```

- For API details, see [PutBucketAcl](#) in *AWS SDK for Java 2.x API Reference*.

## Set the website configuration for a bucket

The following code example shows how to set the website configuration for an S3 bucket.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void setWebsiteConfig( S3Client s3, String bucketName, String
indexDoc) {

    try {
        WebsiteConfiguration websiteConfig = WebsiteConfiguration.builder()
            .indexDocument(IndexDocument.builder().suffix(indexDoc).build())
            .build();

        PutBucketWebsiteRequest pubWebsiteReq = PutBucketWebsiteRequest.builder()
            .bucket(bucketName)
            .websiteConfiguration(websiteConfig)
            .build();

        s3.putBucketWebsite(pubWebsiteReq);
        System.out.println("The call was successful");

    } catch (S3Exception e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [PutBucketWebsite](#) in *AWS SDK for Java 2.x API Reference*.

## Upload an object to a bucket

The following code example shows how to upload an object to an S3 bucket.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Upload an object to a bucket.

```
public static String putS3Object(S3Client s3, String bucketName, String objectKey,  
String objectPath) {  
  
    try {  
        Map<String, String> metadata = new HashMap<>();  
        metadata.put("x-amz-meta-myVal", "test");  
        PutObjectRequest putOb = PutObjectRequest.builder()  
            .bucket(bucketName)  
            .key(objectKey)  
            .metadata(metadata)  
            .build();  
  
        PutObjectResponse response = s3.putObject(putOb,  
RequestBody.fromBytes(getObjectFile(objectPath)));  
        return response.eTag();  
  
    } catch (S3Exception e) {  
        System.err.println(e.getMessage());  
        System.exit(1);  
    }  
  
    return "";  
}  
  
// Return a byte array.  
private static byte[] getObjectFile(String filePath) {  
  
    FileInputStream fileInputStream = null;  
    byte[] bytesArray = null;  
  
    try {  
        File file = new File(filePath);  
        bytesArray = new byte[(int) file.length()];  
        fileInputStream = new FileInputStream(file);  
        fileInputStream.read(bytesArray);  
  
    } catch (IOException e) {  
        e.printStackTrace();  
    } finally {  
        if (fileInputStream != null) {  
            try {  
                fileInputStream.close();  
            } catch (IOException e) {  
                e.printStackTrace();  
            }  
        }  
    }  
  
    return bytesArray;  
}
```

Upload an object to a bucket and set tags.

```
public static void putS3ObjectTags(S3Client s3, String bucketName, String  
objectKey, String objectPath) {  
  
    try {  
  
        Tag tag1 = Tag.builder()  
            .key("Tag 1")  
            .value("This is tag 1")  
            .build();  
  
    }
```

```
Tag tag2 = Tag.builder()
    .key("Tag 2")
    .value("This is tag 2")
    .build();

List<Tag> tags = new ArrayList<>();
tags.add(tag1);
tags.add(tag2);

Tagging allTags = Tagging.builder()
    .tagSet(tags)
    .build();

PutObjectRequest putOb = PutObjectRequest.builder()
    .bucket(bucketName)
    .key(objectKey)
    .tagging(allTags)
    .build();

s3.putObject(putOb, RequestBody.fromBytes(getObjectFile(objectPath)));

} catch (S3Exception e) {
    System.err.println(e.getMessage());
    System.exit(1);
}
}

public static void updateObjectTags(S3Client s3, String bucketName, String
objectKey) {

    try {
        GetObjectTaggingRequest taggingRequest = GetObjectTaggingRequest.builder()
            .bucket(bucketName)
            .key(objectKey)
            .build();

        GetObjectTaggingResponse getTaggingRes =
s3.getObjectTagging(taggingRequest);
        List<Tag> obTags = getTaggingRes.tagSet();
        for (Tag sinTag: obTags) {
            System.out.println("The tag key is: "+sinTag.key());
            System.out.println("The tag value is: "+sinTag.value());
        }

        // Replace the object's tags with two new tags.
        Tag tag3 = Tag.builder()
            .key("Tag 3")
            .value("This is tag 3")
            .build();

        Tag tag4 = Tag.builder()
            .key("Tag 4")
            .value("This is tag 4")
            .build();

        List<Tag> tags = new ArrayList<>();
        tags.add(tag3);
        tags.add(tag4);

        Tagging updatedTags = Tagging.builder()
            .tagSet(tags)
            .build();

        PutObjectTaggingRequest taggingRequest1 = PutObjectTaggingRequest.builder()
            .bucket(bucketName)
            .key(objectKey)
```

```
        .tagging(updatedTags)
        .build();

        s3.putObjectTagging(taggingRequest1);
        GetObjectTaggingResponse getTaggingRes2 =
s3.getObjectTagging(taggingRequest);
        List<Tag> modTags = getTaggingRes2.tagSet();
        for (Tag sinTag: modTags) {
            System.out.println("The tag key is: "+sinTag.key());
            System.out.println("The tag value is: "+sinTag.value());
        }

    } catch (S3Exception e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
}
```

Upload an object to a bucket and set metadata.

```
public static String putS3Object(S3Client s3, String bucketName, String objectKey,
String objectPath) {

    try {
        Map<String, String> metadata = new HashMap<>();
        metadata.put("author", "Mary Doe");
        metadata.put("version", "1.0.0.0");

        PutObjectRequest putOb = PutObjectRequest.builder()
            .bucket(bucketName)
            .key(objectKey)
            .metadata(metadata)
            .build();

        PutObjectResponse response = s3.putObject(putOb,
RequestBody.fromBytes(getObjectFile(objectPath)));
        return response.eTag();

    } catch (S3Exception e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }

    return "";
}

// Return a byte array.
private static byte[] getObjectFile(String filePath) {

    FileInputStream fileInputStream = null;

## Scenarios

### Create a presigned URL

The following code example shows how to create a presigned URL for S3 and upload an object.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void signBucket(S3Presigner presigner, String bucketName, String
keyName) {
```

```
try {
    PutObjectRequest objectRequest = PutObjectRequest.builder()
        .bucket(bucketName)
        .key(keyName)
        .contentType("text/plain")
        .build();

    PutObjectPresignRequest presignRequest = PutObjectPresignRequest.builder()
        .signatureDuration(Duration.ofMinutes(10))
        .putObjectRequest(objectRequest)
        .build();

    PresignedPutObjectRequest presignedRequest =
presigner.presignPutObject(presignRequest);
    String myURL = presignedRequest.url().toString();
    System.out.println("Presigned URL to upload a file to: " +myURL);
    System.out.println("Which HTTP method needs to be used when uploading a
file: " + presignedRequest.httpRequest().method());

    // Upload content to the Amazon S3 bucket by using this URL.
    URL url = presignedRequest.url();

    // Create the connection and use it to upload the new object by using the
presigned URL.
    HttpURLConnection connection = (HttpURLConnection) url.openConnection();
    connection.setDoOutput(true);
    connection.setRequestProperty("Content-Type", "text/plain");
    connection.setRequestMethod("PUT");
    OutputStreamWriter out = new
OutputStreamWriter(connection.getOutputStream());
    out.write("This text was uploaded as an object by using a presigned URL.");
    out.close();

    connection.getResponseCode();
    System.out.println("HTTP response code is " +
connection.getResponseCode());

} catch (S3Exception | IOException e) {
    e.printStackTrace();
}
}
```

## Get started with buckets and objects

The following code example shows how to:

- Create a bucket.
- Upload a file to the bucket.
- Download an object from a bucket.
- Copy an object to a subfolder in a bucket.
- List the objects in a bucket.
- Delete the objects in a bucket.
- Delete a bucket.

## SDK for Java 2.x

## S3 Glacier examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon S3 Glacier.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3433\)](#)

## Actions

### Create a vault

The following code example shows how to create an Amazon S3 Glacier vault.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void createGlacierVault(GlacierClient glacier, String vaultName) {  
  
    try {  
        CreateVaultRequest vaultRequest = CreateVaultRequest.builder()  
            .vaultName(vaultName)  
            .build();  
  
        CreateVaultResponse createVaultResult = glacier.createVault(vaultRequest);  
        System.out.println("The URI of the new vault is " +  
            createVaultResult.location());  
  
    } catch(GlacierException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
}
```

- For API details, see [CreateVault](#) in *AWS SDK for Java 2.x API Reference*.

### Delete a vault

The following code example shows how to delete an Amazon S3 Glacier vault.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void deleteGlacierArchive(GlacierClient glacier, String vaultName,  
String accountId, String archiveId) {  
  
    try {  
        DeleteArchiveRequest delArcRequest = DeleteArchiveRequest.builder()  
            .vaultName(vaultName)  
            .accountId(accountId)  
            .archiveId(archiveId)  
            .build();  
  
        glacier.deleteArchive(delArcRequest);  
        System.out.println("The vault was deleted!");  
  
    } catch(GlacierException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
}
```

```
}
```

- For API details, see [DeleteVault](#) in *AWS SDK for Java 2.x API Reference*.

## Delete an archive

The following code example shows how to delete an Amazon S3 Glacier archive.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void deleteGlacierArchive(GlacierClient glacier, String vaultName,
String accountId, String archiveId) {

    try {
        DeleteArchiveRequest delArcRequest = DeleteArchiveRequest.builder()
            .vaultName(vaultName)
            .accountId(accountId)
            .archiveId(archiveId)
            .build();

        glacier.deleteArchive(delArcRequest);
        System.out.println("The vault was deleted!");

    } catch(GlacierException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [DeleteArchive](#) in *AWS SDK for Java 2.x API Reference*.

## List vaults

The following code example shows how to list Amazon S3 Glacier vaults.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void listAllVault(GlacierClient glacier) {

    boolean listComplete = false;
    String newMarker = null;
    int totalVaults = 0;
    System.out.println("Your Amazon Glacier vaults:");

    try {

        while (!listComplete) {
            ListVaultsResponse response = null;
```

```
if (newMarker != null) {
    ListVaultsRequest request = ListVaultsRequest.builder()
        .marker(newMarker)
        .build();

    response = glacier.listVaults(request);
} else {
    ListVaultsRequest request = ListVaultsRequest.builder()
        .build();
    response = glacier.listVaults(request);
}

List<DescribeVaultOutput> vaultList = response.vaultList();
for (DescribeVaultOutput v: vaultList) {
    totalVaults += 1;
    System.out.println("* " + v.vaultName());
}

// Check for further results.
newMarker = response.marker();
if (newMarker == null) {
    listComplete = true;
}
}

if (totalVaults == 0) {
    System.out.println("No vaults found.");
}

} catch(GlacierException e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}
}
```

- For API details, see [ListVaults](#) in *AWS SDK for Java 2.x API Reference*.

## Retrieve a vault inventory

The following code example shows how to retrieve an Amazon S3 Glacier vault inventory.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String createJob(GlacierClient glacier, String vaultName, String
accountId) {

    try {

        JobParameters job = JobParameters.builder()
            .type("inventory-retrieval")
            .build();

        InitiateJobRequest initJob = InitiateJobRequest.builder()
            .jobParameters(job)
            .accountId(accountId)
            .vaultName(vaultName)
            .build();
    }
}
```

```
        InitiateJobResponse response = glacier.initiateJob(initJob);
        System.out.println("The job ID is: " +response.jobId());
        System.out.println("The relative URI path of the job is: "
+response.location());
        return response.jobId();

    } catch(GlacierException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);

    }
    return "";
}

## Actions

### Add tags to a topic

The following code example shows how to add tags to an Amazon SNS topic.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void addTopicTags(SnsClient snsClient, String topicArn) {

    try {
        Tag tag = Tag.builder()
            .key("Team")
```

```
        .value("Development")
        .build();

    Tag tag2 = Tag.builder()
        .key("Environment")
        .value("Gamma")
        .build();

    List<Tag> tagList = new ArrayList<>();
    tagList.add(tag);
    tagList.add(tag2);

    TagResourceRequest tagResourceRequest = TagResourceRequest.builder()
        .resourceArn(topicArn)
        .tags(tagList)
        .build();

    snsClient.tagResource(tagResourceRequest);
    System.out.println("Tags have been added to "+topicArn);

} catch (SnsException e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}
}
```

- For API details, see [TagResource](#) in *AWS SDK for Java 2.x API Reference*.

## Check whether a phone number is opted out

The following code example shows how to check whether a phone number is opted out of receiving Amazon SNS messages.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void checkPhone(SnsClient snsClient, String phoneNumber) {

    try {
        CheckIfPhoneNumberIsOptedOutRequest request =
CheckIfPhoneNumberIsOptedOutRequest.builder()
        .phoneNumber(phoneNumber)
        .build();

        CheckIfPhoneNumberIsOptedOutResponse result =
snsClient.checkIfPhoneNumberIsOptedOut(request);
        System.out.println(result.isOptedOut() + "Phone Number " + phoneNumber + " has Opted Out of receiving sns messages."
            + "\n\nStatus was " + result.sdkHttpResponse().statusCode());

    } catch (SnsException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [CheckIfPhoneNumberIsOptedOut](#) in *AWS SDK for Java 2.x API Reference*.

## Confirm an endpoint owner wants to receive messages

The following code example shows how to confirm the owner of an endpoint wants to receive Amazon SNS messages by validating the token sent to the endpoint by an earlier Subscribe action.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void confirmSub(SnsClient snsClient, String subscriptionToken, String topicArn) {  
  
    try {  
        ConfirmSubscriptionRequest request = ConfirmSubscriptionRequest.builder()  
            .token(subscriptionToken)  
            .topicArn(topicArn)  
            .build();  
  
        ConfirmSubscriptionResponse result =  
            snsClient.confirmSubscription(request);  
        System.out.println("\n\nStatus was " +  
            result.sdkHttpResponse().statusCode() + "\n\nSubscription Arn: \n\n" +  
            result.subscriptionArn());  
  
    } catch (SnsException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
}
```

- For API details, see [ConfirmSubscription](#) in *AWS SDK for Java 2.x API Reference*.

## Create a topic

The following code example shows how to create an Amazon SNS topic.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String createSNSTopic(SnsClient snsClient, String topicName) {

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void unSub(SnsClient snsClient, String subscriptionArn) {  
  
    try {  
        UnsubscribeRequest request = UnsubscribeRequest.builder()  
            .subscriptionArn(subscriptionArn)  
            .build();  
  
        UnsubscribeResponse result = snsClient.unsubscribe(request);  
        System.out.println("\n\nStatus was " +  
result.sdkHttpResponse().statusCode()  
            + "\n\nSubscription was removed for " + request.subscriptionArn());  
  
    } catch (SnsException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
}
```

- For API details, see [Unsubscribe](#) in *AWS SDK for Java 2.x API Reference*.

## Delete a topic

The following code example shows how to delete an Amazon SNS topic and all subscriptions to that topic.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void deleteSNSTopic(SnsClient snsClient, String topicArn ) {  
  
    try {  
        DeleteTopicRequest request = DeleteTopicRequest.builder()  
            .topicArn(topicArn)  
            .build();  
  
        DeleteTopicResponse result = snsClient.deleteTopic(request);  
        System.out.println("\n\nStatus was " +  
result.sdkHttpResponse().statusCode());  
  
    } catch (SnsException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
    }  
}
```

```
        System.exit(1);
    }
}
```

- For API details, see [DeleteTopic](#) in *AWS SDK for Java 2.x API Reference*.

## Get the properties of a topic

The following code example shows how to get the properties of an Amazon SNS topic.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void getSNSTopicAttributes(SnsClient snsClient, String topicArn ) {

    try {
        GetTopicAttributesRequest request = GetTopicAttributesRequest.builder()
            .topicArn(topicArn)
            .build();

        GetTopicAttributesResponse result = snsClient.getTopicAttributes(request);
        System.out.println("\n\nStatus is " + result.sdkHttpResponse().statusCode()
+ "\n\nAttributes: \n\n" + result.attributes());

    } catch (SnsException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [GetTopicAttributes](#) in *AWS SDK for Java 2.x API Reference*.

## Get the settings for sending SMS messages

The following code example shows how to get the settings for sending Amazon SNS SMS messages.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void getSNSAttributes(SnsClient snsClient, String topicArn ) {

    try {
        GetSubscriptionAttributesRequest request =
GetSubscriptionAttributesRequest.builder()
            .subscriptionArn(topicArn)
            .build();

        // Get the Subscription attributes
        GetSubscriptionAttributesResponse res =
snsClient.getSubscriptionAttributes(request);
        Map<String, String> map = res.attributes();
```

```
// Iterate through the map
Iterator iter = map.entrySet().iterator();
while (iter.hasNext()) {
    Map.Entry entry = (Map.Entry) iter.next();
    System.out.println("[Key] : " + entry.getKey() + " [Value] : " +
entry.getValue());
}

} catch (SnsException e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}

System.out.println("\n\nStatus was good");
}
```

- For API details, see [GetSMSAttributes](#) in *AWS SDK for Java 2.x API Reference*.

### List opted out phone numbers

The following code example shows how to list phone numbers that are opted out of receiving Amazon SNS messages.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void list0pts( SnsClient snsClient ) {

    try {
        ListPhoneNumbersOptedOutRequest request =
ListPhoneNumbersOptedOutRequest.builder().build();
        ListPhoneNumbersOptedOutResponse result =
snsClient.listPhoneNumbersOptedOut(request);
        System.out.println("Status is " + result.sdkHttpResponse().statusCode() +
"\n\nPhone Numbers: \n\n" + result.phoneNumbers());

    } catch (SnsException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [ListPhoneNumbersOptedOut](#) in *AWS SDK for Java 2.x API Reference*.

### List the subscribers of a topic

The following code example shows how to retrieve the list of subscribers of an Amazon SNS topic.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void listSNSSubscriptions( SnsClient snsClient ) {
```

```
try {
    ListSubscriptionsRequest request = ListSubscriptionsRequest.builder()
        .build();

    ListSubscriptionsResponse result = snsClient.listSubscriptions(request);
    System.out.println(result.subscriptions());

} catch (SnsException e) {

    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}
```

- For API details, see [ListSubscriptions](#) in *AWS SDK for Java 2.x API Reference*.

## List topics

The following code example shows how to list Amazon SNS topics.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void listSNSTopics(SnsClient snsClient) {

    try {
        ListTopicsRequest request = ListTopicsRequest.builder()
            .build();

        ListTopicsResponse result = snsClient.listTopics(request);
        System.out.println("Status was " + result.sdkHttpResponse().statusCode() +
"\n\nTopics\n\n" + result.topics());

    } catch (SnsException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [ListTopics](#) in *AWS SDK for Java 2.x API Reference*.

## Publish an SMS text message

The following code example shows how to publish SMS messages using Amazon SNS.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void pubTextSMS(SnsClient snsClient, String message, String
phoneNumber) {
    try {
```

```
PublishRequest request = PublishRequest.builder()  
    .message(message)  
    .phoneNumber(phoneNumber)  
    .build();  
  
PublishResponse result = snsClient.publish(request);  
System.out.println(result.messageId() + " Message sent. Status was " +  
result.sdkHttpResponse().statusCode());  
  
} catch (SnsException e) {  
    System.err.println(e.awsErrorDetails().errorMessage());  
    System.exit(1);  
}  
}
```

- For API details, see [Publish](#) in *AWS SDK for Java 2.x API Reference*.

## Publish to a topic

The following code example shows how to publish messages to an Amazon SNS topic.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void pubTopic(SnsClient snsClient, String message, String topicArn) {  
  
    try {  
        PublishRequest request = PublishRequest.builder()  
            .message(message)  
            .topicArn(topicArn)  
            .build();  
  
        PublishResponse result = snsClient.publish(request);  
        System.out.println(result.messageId() + " Message sent. Status is " +  
result.sdkHttpResponse().statusCode());  
  
    } catch (SnsException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
}
```

- For API details, see [Publish](#) in *AWS SDK for Java 2.x API Reference*.

## Set a filter policy

The following code example shows how to set an Amazon SNS filter policy.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void usePolicy(SnsClient snsClient, String subscriptionArn) {
```

```
try {
    SNSMessageFilterPolicy fp = new SNSMessageFilterPolicy();
    // Add a filter policy attribute with a single value
    fp.addAttribute("store", "example_corp");
    fp.addAttribute("event", "order_placed");

    // Add a prefix attribute
    fp.addAttributePrefix("customer_interests", "bas");

    // Add an anything-but attribute
    fp.addAttributeAnythingBut("customer_interests", "baseball");

    // Add a filter policy attribute with a list of values
    ArrayList<String> attributeValues = new ArrayList<>();
    attributeValues.add("rugby");
    attributeValues.add("soccer");
    attributeValues.add("hockey");
    fp.addAttribute("customer_interests", attributeValues);

    // Add a numeric attribute
    fp.addAttribute("price_usd", "=", 0);

    // Add a numeric attribute with a range
    fp.addAttributeRange("price_usd", ">", 0, "<=", 100);

    // Apply the filter policy attributes to an Amazon SNS subscription
    fp.apply(snsClient, subscriptionArn);

} catch (SnsException e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}
}
```

- For API details, see [SetSubscriptionAttributes](#) in *AWS SDK for Java 2.x API Reference*.

## Set the default settings for sending SMS messages

The following code example shows how to set the default settings for sending SMS messages using Amazon SNS.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public class SetSMSAttributes {
    public static void main(String[] args) {

        HashMap<String, String> attributes = new HashMap<>(1);
        attributes.put("DefaultSMSType", "Transactional");
        attributes.put("UsageReportS3Bucket", "janbucket" );

        SnsClient snsClient = SnsClient.builder()
            .region(Region.US_EAST_1)
            .credentialsProvider(ProfileCredentialsProvider.create())
            .build();
        setSNSAttributes(snsClient, attributes);
        snsClient.close();
    }
}
```

```
public static void setSNSAttributes( SnsClient snsClient, HashMap<String, String> attributes) {

    try {
        SetSmsAttributesRequest request = SetSmsAttributesRequest.builder()
            .attributes(attributes)
            .build();

        SetSmsAttributesResponse result = snsClient.setSMSAttributes(request);
        System.out.println("Set default Attributes to " + attributes + ". Status was " + result.sdkHttpResponse().statusCode());

    } catch (SnsException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [SetSmsAttributes](#) in *AWS SDK for Java 2.x API Reference*.

## Set topic attributes

The following code example shows how to set Amazon SNS topic attributes.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void setTopAttr(SnsClient snsClient, String attribute, String topicArn, String value) {

    try {
        SetTopicAttributesRequest request = SetTopicAttributesRequest.builder()
            .attributeName(attribute)
            .attributeValue(value)
            .topicArn(topicArn)
            .build();

        SetTopicAttributesResponse result = snsClient.setTopicAttributes(request);
        System.out.println("\n\nStatus was " +
result.sdkHttpResponse().statusCode() + "\n\nTopic " + request.topicArn() +
            " updated " + request.attributeName() + " to " +
request.attributeValue());

    } catch (SnsException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [SetTopicAttributes](#) in *AWS SDK for Java 2.x API Reference*.

## Subscribe a Lambda function to a topic

The following code example shows how to subscribe a Lambda function so it receives notifications from an Amazon SNS topic.

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String subLambda(SnsClient snsClient, String topicArn, String lambdaArn) {  
  
    try {  
        SubscribeRequest request = SubscribeRequest.builder()  
            .protocol("lambda")  
            .endpoint(lambdaArn)  
            .returnSubscriptionArn(true)  
            .topicArn(topicArn)  
            .build();  
  
        SubscribeResponse result = snsClient.subscribe(request);  
        return result.subscriptionArn();  
  
    } catch (SnsException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
    return "";  
}
```

- For API details, see [Subscribe](#) in *AWS SDK for Java 2.x API Reference*.

## Subscribe an HTTP endpoint to a topic

The following code example shows how to subscribe an HTTP or HTTPS endpoint so it receives notifications from an Amazon SNS topic.

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void subHTTPS(SnsClient snsClient, String topicArn, String url ) {  
  
    try {  
        SubscribeRequest request = SubscribeRequest.builder()  
            .protocol("https")  
            .endpoint(url)  
            .returnSubscriptionArn(true)  
            .topicArn(topicArn)  
            .build();  
  
        SubscribeResponse result = snsClient.subscribe(request);  
        System.out.println("Subscription ARN is " + result.subscriptionArn() + "\n"  
"\n Status is " + result.sdkHttpResponse().statusCode());  
  
    } catch (SnsException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
}
```

- For API details, see [Subscribe](#) in *AWS SDK for Java 2.x API Reference*.

### Subscribe an email address to a topic

The following code example shows how to subscribe an email address to an Amazon SNS topic.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void subEmail(SnsClient snsClient, String topicArn, String email) {  
  
    try {  
        SubscribeRequest request = SubscribeRequest.builder()  
            .protocol("email")  
            .endpoint(email)  
            .returnSubscriptionArn(true)  
            .topicArn(topicArn)  
            .build();  
  
        SubscribeResponse result = snsClient.subscribe(request);  
        System.out.println("Subscription ARN: " + result.subscriptionArn() + "\n\n"  
    Status is " + result.sdkHttpResponse().statusCode());  
  
    } catch (SnsException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
}
```

- For API details, see [Subscribe](#) in *AWS SDK for Java 2.x API Reference*.

## Scenarios

### Create a platform endpoint for push notifications

The following code example shows how to create a platform endpoint for Amazon SNS push notifications.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public class RegistrationExample {  
  
    public static void main(String[] args) {  
  
        final String usage = "\n" +  
            "Usage: " +  
            "    <token>\n\n" +  
            "Where:\n" +  
            "    token - The name of the FIFO topic. \n\n" +  
            "    platformApplicationArn - The ARN value of platform application. You can  
        get this value from the AWS Management Console. \n\n";
```

```
if (args.length != 2) {
    System.out.println(usage);
    System.exit(1);
}

String token = args[0];
String platformApplicationArn = args[1];
SnsClient snsClient = SnsClient.builder()
    .region(Region.US_EAST_1)
    .credentialsProvider(ProfileCredentialsProvider.create())
    .build();

createEndpoint(snsClient, token, platformApplicationArn);
}

public static void createEndpoint(SnsClient snsClient, String token, String
platformApplicationArn){

    System.out.println("Creating platform endpoint with token " + token);

    try {
        CreatePlatformEndpointRequest endpointRequest =
CreatePlatformEndpointRequest.builder()
            .token(token)
            .platformApplicationArn(platformApplicationArn)
            .build();

        CreatePlatformEndpointResponse response =
snsClient.createPlatformEndpoint(endpointRequest);
        System.out.println("The ARN of the endpoint is " + response.endpointArn());
    } catch ( SnsException e ) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
}
```

## Create and publish to a FIFO topic

The following code example shows how to create and publish to a FIFO Amazon SNS topic.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a FIFO topic and FIFO queues. Subscribe the queues to the topic.

```
public static void main(String[] args) {

    final String usage = "\n" +
        "Usage: " +
        "    <topicArn>\n\n" +
        "Where:\n" +
        "    fifoTopicName - The name of the FIFO topic. \n\n" +
        "    fifoQueueARN - The ARN value of a SQS FIFO queue. You can get this
value from the AWS Management Console. \n\n";

    if (args.length != 2) {
        System.out.println(usage);
        System.exit(1);
    }
}
```

```
}

String fifoTopicName = "PriceUpdatesTopic3.fifo";
String fifoQueueARN = "arn:aws:sqs:us-east-1:814548047983:MyPriceSQS.fifo";
SnsClient snsClient = SnsClient.builder()
    .region(Region.US_EAST_1)
    .credentialsProvider(ProfileCredentialsProvider.create())
    .build();

createFIFO(snsClient, fifoTopicName, fifoQueueARN);
}

public static void createFIFO(SnsClient snsClient, String topicName, String
queueARN) {

try {
    // Create a FIFO topic by using the SNS service client.
    Map<String, String> topicAttributes = new HashMap<>();
    topicAttributes.put("FifoTopic", "true");
    topicAttributes.put("ContentBasedDeduplication", "false");

    CreateTopicRequest topicRequest = CreateTopicRequest.builder()
        .name(topicName)
        .attributes(topicAttributes)
        .build();

    CreateTopicResponse response = snsClient.createTopic(topicRequest);
    String topicArn = response.topicArn();
    System.out.println("The topic ARN is"+topicArn);

    // Subscribe to the endpoint by using the SNS service client.
    // Only Amazon SQS FIFO queues can receive notifications from an Amazon SNS
FIFO topic.
    SubscribeRequest subscribeRequest = SubscribeRequest.builder()
        .topicArn(topicArn)
        .endpoint(queueARN)
        .protocol("sqS")
        .build();

    snsClient.subscribe(subscribeRequest);
    System.out.println("The topic is subscribed to the queue.");

    // Compose and publish a message that updates the wholesale price.
    String subject = "Price Update";
    String payload = "{\"product\": 214, \"price\": 79.99}";
    String groupId = "PID-214";
    String dedupId = UUID.randomUUID().toString();
    String attributeName = "business";
    String attributeValue = "wholesale";

    MessageAttributeValue msgAttValue = MessageAttributeValue.builder()
        .dataType("String")
        .stringValue(attributeValue)
        .build();

    Map<String, MessageAttributeValue> attributes = new HashMap<>();
    attributes.put(attributeName, msgAttValue);
    PublishRequest pubRequest = PublishRequest.builder()
        .topicArn(topicArn)
        .subject(subject)
        .message(payload)
        .messageGroupId(groupId)
        .messageDuplicationId(dedupId)
        .messageAttributes(attributes)
        .build();
}
```

```
        snsClient.publish(pubRequest);
        System.out.println("Message was published to "+topicArn);

    } catch (SnsException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

## Publish SMS messages to a topic

The following code example shows how to:

- Create an Amazon SNS topic.
- Subscribe phone numbers to the topic.
- Publish SMS messages to the topic so that all subscribed phone numbers receive the message at once.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a topic and return its ARN.

```
public static String createSNSTopic(SnsClient snsClient, String topicName ) {

    CreateTopicResponse result = null;
    try {
        CreateTopicRequest request = CreateTopicRequest.builder()
            .name(topicName)
            .build();

        result = snsClient.createTopic(request);
        return result.topicArn();

    } catch (SnsException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
    return "";
}
```

Subscribe an endpoint to a topic.

```
public static void subTextSMS( SnsClient snsClient, String topicArn, String
phoneNumber) {

    try {
        SubscribeRequest request = SubscribeRequest.builder()
            .protocol("sms")
            .endpoint(phoneNumber)
            .returnSubscriptionArn(true)
            .topicArn(topicArn)
            .build();

        SubscribeResponse result = snsClient.subscribe(request);
```

```
        System.out.println("Subscription ARN: " + result.subscriptionArn() + "\n\n"
Status is " + result.sdkHttpResponse().statusCode());

    } catch (SnsException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

Set attributes on the message, such as the ID of the sender, the maximum price, and its type. Message attributes are optional.

```
public class SetSMSAttributes {
    public static void main(String[] args) {

        HashMap<String, String> attributes = new HashMap<>(1);
        attributes.put("DefaultSMSType", "Transactional");
        attributes.put("UsageReportS3Bucket", "janbucket" );

        SnsClient snsClient = SnsClient.builder()
            .region(Region.US_EAST_1)

            System.out.println("The event type is "+event.type().toString());
        }

    } catch (SfnException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [ListExecutions](#) in *AWS SDK for Java 2.x API Reference*.

## List state machines

The following code example shows how to list Step Functions state machines.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void listMachines(SfnClient sfnClient) {

    try {
        ListStateMachinesResponse response = sfnClient.listStateMachines();
        List<StateMachineListItem> machines = response.stateMachines();
        for (StateMachineListItem machine :machines) {
            System.out.println("The name of the state machine is:
"+machine.name());
            System.out.println("The ARN value is : "+machine.stateMachineArn());
        }

    } catch (SfnException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [ListStateMachines](#) in *AWS SDK for Java 2.x API Reference*.

## Start a state machine run

The following code example shows how to start a Step Functions state machine run.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String startWorkflow(SfnClient sfnClient, String stateMachineArn,
String jsonFile) {

    String json = getJSONString(jsonFile);
    UUID uuid = UUID.randomUUID();
    String uuidValue = uuid.toString();
    try {

        StartExecutionRequest executionRequest = StartExecutionRequest.builder()
            .input(json)
            .stateMachineArn(stateMachineArn)
            .name(uuidValue)
            .build();

        StartExecutionResponse response =
sfnClient.startExecution(executionRequest);
        return response.executionArn();

    } catch (SfnException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
    return "";
}

private static String getJSONString(String path) {

    try {
        JSONParser parser = new JSONParser();
        JSONObject data = (JSONObject) parser.parse(new FileReader(path)); //path to
the JSON file.
        String json = data.toJSONString();
        return json;

    } catch (IOException | org.json.simple.parser.ParseException e) {
        e.printStackTrace();
    }
    return "";
}
```

## AWS Support examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with AWS Support.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

## Get started

### Hello AWS Support

The following code examples show how to get started using AWS Support.

#### .NET

##### AWS SDK for .NET

###### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using Amazon AWSSupport;
using Microsoft.Extensions.DependencyInjection;
using Microsoft.Extensions.Hosting;

public static class HelloSupport
{
    static async Task Main(string[] args)
    {
        // Use the AWS .NET Core Setup package to set up dependency injection for
        // the AWS Support service.
        // Use your AWS profile name, or leave it blank to use the default profile.
        // You must have one of the following AWS Support plans: Business,
        Enterprise On-Ramp, or Enterprise. Otherwise, an exception will be thrown.
        using var host = Host.CreateDefaultBuilder(args)
            .ConfigureServices(_ , services) =>
                services.AddAWSService<IAmazonAWSSupport>()
            .Build();

        // Now the client is available for injection.
        var supportClient = host.Services.GetRequiredService<IAmazonAWSSupport>();

        // You can use await and any of the async methods to get a response.
        var response = await supportClient.DescribeServicesAsync();
        Console.WriteLine($"\\tHello AWS Support! There are
{response.Services.Count} services available.");
    }
}
```

- For API details, see [DescribeServices](#) in *AWS SDK for .NET API Reference*.

#### Java

##### SDK for Java 2.x

###### Note

- [Scenarios \(p. 3484\)](#)

## Actions

### Add a communication to a case

The following code example shows how to add an AWS Support communication with an attachment to a support case.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void addAttachSupportCase(SupportClient supportClient, String caseId,
String attachmentSetId) {
    try {
        AddCommunicationToCaseRequest caseRequest =
AddCommunicationToCaseRequest.builder()
        .caseId(caseId)
        .attachmentSetId(attachmentSetId)
        .communicationBody("Please refer to attachment for details.")
        .build();

        AddCommunicationToCaseResponse response =
supportClient.addCommunicationToCase(caseRequest);
        if (response.result())
            System.out.println("You have successfully added a communication to an
AWS Support case");
        else
            System.out.println("There was an error adding the communication to an
AWS Support case");

    } catch (SupportException e) {
        System.out.println(e.getLocalizedMessage());
        System.exit(1);
    }
}
```

- For API details, see [AddCommunicationToCase](#) in *AWS SDK for Java 2.x API Reference*.

### Add an attachment to a set

The following code example shows how to add an AWS Support attachment to an attachment set.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String addAttachment(SupportClient supportClient, String fileAttachment) {
    try {
        File myFile = new File(fileAttachment);
        InputStream sourceStream = new FileInputStream(myFile);
        SdkBytes sourceBytes = SdkBytes.fromInputStream(sourceStream);

        Attachment attachment = Attachment.builder()
            .fileName(myFile.getName())
            .data(sourceBytes)
            .build();

        AddAttachmentsToSetRequest setRequest =
        AddAttachmentsToSetRequest.builder()
            .attachments(attachment)
            .build();

        AddAttachmentsToSetResponse response =
        supportClient.addAttachmentsToSet(setRequest);
        return response.attachmentSetId();

    } catch (SupportException | FileNotFoundException e) {
        System.out.println(e.getLocalizedMessage());
        System.exit(1);
    }
    return "";
}
```

- For API details, see [AddAttachmentsToSet](#) in *AWS SDK for Java 2.x API Reference*.

## Create a case

The following code example shows how to create a new AWS Support case.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String createSupportCase(SupportClient supportClient, List<String> sevCatList, String sevLevel) {
    try {
        String serviceCode = sevCatList.get(0);
        String caseCat = sevCatList.get(1);
        CreateCaseRequest caseRequest = CreateCaseRequest.builder()
            .categoryCode(caseCat.toLowerCase())
            .serviceCode(serviceCode.toLowerCase())
            .severityCode(sevLevel.toLowerCase())
            .communicationBody("Test issue with "+serviceCode.toLowerCase())
            .subject("Test case, please ignore")
            .language("en")
            .issueType("technical")
            .build();

        CreateCaseResponse response = supportClient.createCase(caseRequest);
        return response.caseId();

    } catch (SupportException e) {
        System.out.println(e.getLocalizedMessage());
    }
}
```

```
        System.exit(1);
    }
    return "";
}
```

- For API details, see [CreateCase](#) in *AWS SDK for Java 2.x API Reference*.

## Describe an attachment

The following code example shows how to describe an attachment for an AWS Support case.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void describeAttachment(SupportClient supportClient, String attachId) {
    try {
        DescribeAttachmentRequest attachmentRequest =
DescribeAttachmentRequest.builder()
            .attachmentId(attachId)
            .build();

        DescribeAttachmentResponse response =
supportClient.describeAttachment(attachmentRequest);
        System.out.println("The name of the file is
"+response.attachment().fileName());

    } catch (SupportException e) {
        System.out.println(e.getLocalizedMessage());
        System.exit(1);
    }
}
```

- For API details, see [DescribeAttachment](#) in *AWS SDK for Java 2.x API Reference*.

## Describe cases

The following code example shows how to describe AWS Support cases.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void getOpenCase(SupportClient supportClient) {
    try {
        // Specify the start and end time.
        Instant now = Instant.now();
        java.time.LocalDate.now();
        Instant yesterday = now.minus(1, ChronoUnit.DAYS);

        DescribeCasesRequest describeCasesRequest = DescribeCasesRequest.builder()
```

```
.maxResults(20)
.afterTime(yesterday.toString())
.beforeTime(now.toString())
.build();

DescribeCasesResponse response =
supportClient.describeCases(describeCasesRequest);
List<CaseDetails> cases = response.cases();
for (CaseDetails sinCase: cases) {
    System.out.println("The case status is "+sinCase.status());
    System.out.println("The case Id is "+sinCase.caseId());
    System.out.println("The case subject is "+sinCase.subject());
}

} catch (SupportException e) {
    System.out.println(e.getLocalizedMessage());
    System.exit(1);
}
}
```

- For API details, see [DescribeCases](#) in *AWS SDK for Java 2.x API Reference*.

## Describe communications

The following code example shows how to describe AWS Support communications for a case.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String listCommunications(SupportClient supportClient, String caseId)
{
    try {
        String attachId = null;
        DescribeCommunicationsRequest communicationsRequest =
DescribeCommunicationsRequest.builder()
        .caseId(caseId)
        .maxResults(10)
        .build();

        DescribeCommunicationsResponse response =
supportClient.describeCommunications(communicationsRequest);
        List<Communication> communications = response.communications();
        for (Communication comm: communications) {
            System.out.println("the body is: " + comm.body());

            //Get the attachment id value.
            List<AttachmentDetails> attachments = comm.attachmentSet();
            for (AttachmentDetails detail : attachments) {
                attachId = detail.attachmentId();
            }
        }
        return attachId;

    } catch (SupportException e) {
        System.out.println(e.getLocalizedMessage());
        System.exit(1);
    }
    return "";
}
```

```
}
```

- For API details, see [DescribeCommunications](#) in *AWS SDK for Java 2.x API Reference*.

## Describe services

The following code example shows how to describe the list of AWS services.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Return a List that contains a Service name and Category name.
public static List<String> displayServices(SupportClient supportClient) {
    try {
        DescribeServicesRequest servicesRequest = DescribeServicesRequest.builder()
            .language("en")
            .build();

        DescribeServicesResponse response =
supportClient.describeServices(servicesRequest);
        String serviceCode = null;
        String catName = null;
        List<String> sevCatList = new ArrayList<>();
        List<Service> services = response.services();

        System.out.println("Get the first 10 services");
        int index = 1;
        for (Service service: services) {
            if (index== 11)
                break;

            System.out.println("The Service name is: "+service.name());
            if (service.name().compareTo("Account") == 0)
                serviceCode = service.code();

            // Get the Categories for this service.
            List<Category> categories = service.categories();
            for (Category cat: categories) {
                System.out.println("The category name is: "+cat.name());
                if (cat.name().compareTo("Security") == 0)
                    catName = cat.name();
            }
            index++ ;
        }

        // Push the two values to the list.
        sevCatList.add(serviceCode);
        sevCatList.add(catName);
        return sevCatList;
    } catch (SupportException e) {
        System.out.println(e.getLocalizedMessage());
        System.exit(1);
    }
    return null;
}
```

- For API details, see [DescribeServices](#) in *AWS SDK for Java 2.x API Reference*.

## Describe severity levels

The following code example shows how to describe AWS Support severity levels.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String displaySevLevels(SupportClient supportClient) {  
    try {  
        DescribeSeverityLevelsRequest severityLevelsRequest =  
DescribeSeverityLevelsRequest.builder()  
            .language("en")  
            .build();  
  
        DescribeSeverityLevelsResponse response =  
supportClient.describeSeverityLevels(severityLevelsRequest);  
        List<SeverityLevel> severityLevels = response.severityLevels();  
        String levelName = null;  
        for (SeverityLevel sevLevel: severityLevels) {  
            System.out.println("The severity level name is: " + sevLevel.name());  
            if (sevLevel.name().compareTo("High")==0)  
                levelName = sevLevel.name();  
        }  
        return levelName;  
  
    } catch (SupportException e) {  
        System.out.println(e.getLocalizedMessage());  
        System.exit(1);  
    }  
    return "";  
}
```

- For API details, see [DescribeSeverityLevels](#) in *AWS SDK for Java 2.x API Reference*.

## Resolve case

The following code example shows how to resolve an AWS Support case.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void resolveSupportCase(SupportClient supportClient, String caseId) {  
    try {  
        ResolveCaseRequest caseRequest = ResolveCaseRequest.builder()  
            .caseId(caseId)  
            .build();  
  
        ResolveCaseResponse response = supportClient.resolveCase(caseRequest);  
        System.out.println("The status of case "+caseId+" is  
"+response.finalCaseStatus());  
    }
```

```
        } catch (SupportException e) {
            System.out.println(e.getLocalizedMessage());
            System.exit(1);
    }
}
```

- For API details, see [ResolveCase](#) in *AWS SDK for Java 2.x API Reference*.

## Scenarios

### Get started with cases

The following code example shows how to:

- Get and display available services and severity levels for cases.
- Create a support case using a selected service, category, and severity level.
- Get and display a list of open cases for the current day.
- Add an attachment set and a communication to the new case.
- Describe the new attachment and communication for the case.
- Resolve the case.
- Get and display a list of resolved cases for the current day.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Run various AWS Support operations.

```
/**  
 * Before running this Java (v2) code example, set up your development environment,  
 * including your credentials.  
 *  
 * For more information, see the following documentation topic:  
 *  
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html  
 *  
 * In addition, you must have the AWS Business Support Plan to use the AWS Support  
 * Java API. For more information, see:  
 *  
 * https://aws.amazon.com/premiumsupport/plans/  
 *  
 * This Java example performs the following tasks:  
 *  
 * 1. Gets and displays available services.  
 * 2. Gets and displays severity levels.  
 * 3. Creates a support case by using the selected service, category, and severity  
 * level.  
 * 4. Gets a list of open cases for the current day.  
 * 5. Creates an attachment set with a generated file.  
 * 6. Adds a communication with the attachment to the support case.  
 * 7. Lists the communications of the support case.  
 * 8. Describes the attachment set included with the communication.  
 * 9. Resolves the support case.  
 * 10. Gets a list of resolved cases for the current day.  
 */
```

```
public class SupportScenario {  
  
    public static final String DASHES = new String(new char[80]).replace("\0", "-");

## Amazon Textract examples using SDK for Java 2.x

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Java 2.x with Amazon Textract.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3491\)](#)

## Actions

### Analyze a document

The following code example shows how to analyze a document using Amazon Textract.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void analyzeDoc(TextractClient textractClient, String sourceDoc) {  
  
    try {  
        InputStream sourceStream = new FileInputStream(new File(sourceDoc));  
        SdkBytes sourceBytes = SdkBytes.fromInputStream(sourceStream);  
  
        // Get the input Document object as bytes  
        Document myDoc = Document.builder()  
            .bytes(sourceBytes)  
            .build();  
  
        List<FeatureType> featureTypes = new ArrayList<FeatureType>();  
        featureTypes.add(FeatureType.FORMS);  
        featureTypes.add(FeatureType.TABLES);

### Detect text in a document

The following code example shows how to detect text in a document using Amazon Textract.

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Detect text from an input document.

```
public static void detectDocText(TextractClient textractClient, String sourceDoc) {  
  
    try {  
        InputStream sourceStream = new FileInputStream(new File(sourceDoc));  
        SdkBytes sourceBytes = SdkBytes.fromInputStream(sourceStream);  
  
        // Get the input Document object as bytes  
        Document myDoc = Document.builder()  
            .bytes(sourceBytes)  
            .build();  
  
        DetectDocumentTextRequest detectDocumentTextRequest =  
        DetectDocumentTextRequest.builder()  
            .document(myDoc)  
            .build();  
  
        // Invoke the Detect operation  
        DetectDocumentTextResponse textResponse =  
        textractClient.detectDocumentText(detectDocumentTextRequest);  
        List<Block> docInfo = textResponse.blocks();  
        for (Block block : docInfo) {  
            System.out.println("The block type is " +  
                block.blockType().toString());  
        }  
  
        DocumentMetadata documentMetadata = textResponse.documentMetadata();  
        System.out.println("The number of pages in the document is "  
            +documentMetadata.pages());  
  
    } catch (TextractException | FileNotFoundException e) {  
  
        System.err.println(e.getMessage());  
        System.exit(1);  
    }  
}
```

Detect text from a document located in an Amazon S3 bucket.

```
public static void detectDocTextS3 (TextractClient textractClient, String  
bucketName, String docName) {  
  
    try {  
        S3Object s3Object = S3Object.builder()  
            .bucket(bucketName)  
            .name(docName)  
            .build();  
  
        // Create a Document object and reference the s3Object instance  
        Document myDoc = Document.builder()  
            .s3Object(s3Object)  
            .build();  
  
        DetectDocumentTextRequest detectDocumentTextRequest =  
        DetectDocumentTextRequest.builder()  
            .document(myDoc)  
            .build();  
  
        DetectDocumentTextResponse textResponse =  
        textractClient.detectDocumentText(detectDocumentTextRequest);  
        for (Block block: textResponse.blocks()) {  
            System.out.println("The block type is " +block.blockType().toString());  
        }  
    } catch (TextractException | FileNotFoundException e) {  
  
        System.err.println(e.getMessage());  
        System.exit(1);  
    }  
}
```

```
        }

        DocumentMetadata documentMetadata = textResponse.documentMetadata();
        System.out.println("The number of pages in the document is "
+documentMetadata.pages());

    } catch (TextractException e) {

        System.err.println(e.getMessage());
        System.exit(1);
    }
}
```

- For API details, see [DetectDocumentText](#) in *AWS SDK for Java 2.x API Reference*.

## Start asynchronous analysis of a document

The following code example shows how to start asynchronous analysis of a document using Amazon Textract.

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String startDocAnalysisS3 (TextractClient textractClient, String
bucketName, String docName) {

## Build an application to submit data to a DynamoDB table

### SDK for Java 2.x

Shows how to create a dynamic web application that submits data using the Amazon DynamoDB Java API and sends a text message using the Amazon Simple Notification Service Java API.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- DynamoDB
- Amazon SNS

## Create an Amazon Lex Chatbot within a web application to engage your web site visitors

### SDK for Java 2.x

Shows how to use the Amazon Lex API to create a Chatbot within a web application to engage your web site visitors.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Comprehend
- Amazon Lex
- Amazon Translate

## Build a publish and subscription application that translates messages

### SDK for Java 2.x

Shows how to use the Amazon Simple Notification Service Java API to create a web application that has subscription and publish functionality. In addition, this example application also translates messages.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

For complete source code and instructions on how to set up and run the example that uses the Java Async API, see the full example on [GitHub](#).

#### Services used in this example

- Amazon SNS
- Amazon Translate

## Create a web application that sends and retrieves messages by using the Amazon Simple Queue Service API

### SDK for Java 2.x

Shows how to use the Amazon Simple Queue Service API to develop a Spring REST API that sends and retrieves messages.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Comprehend
- Amazon SQS

## Create a web application to track DynamoDB data

### SDK for Java 2.x

Shows how to use the Amazon DynamoDB API to create a dynamic web application that tracks DynamoDB work data.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- DynamoDB
- Amazon SES

## Create an Amazon Redshift item tracker

### SDK for Java 2.x

Shows how to create a web application that tracks and reports on work items stored in an Amazon Redshift database.

For complete source code and instructions on how to set up a Spring REST API that queries Amazon Redshift data and for use by a React application, see the full example on [GitHub](#).

### Services used in this example

- Amazon Redshift
- Amazon SES

## Create an Aurora Serverless work item tracker

### SDK for Java 2.x

Shows how to create a web application that tracks and reports on work items stored in an Amazon RDS database.

For complete source code and instructions on how to set up a Spring REST API that queries Amazon Aurora Serverless data and for use by a React application, see the full example on [GitHub](#).

For complete source code and instructions on how to set up and run an example that uses the JDBC API, see the full example on [GitHub](#).

### Services used in this example

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

## Detect PPE in images with Amazon Rekognition using an AWS SDK

### SDK for Java 2.x

Shows how to create an AWS Lambda function that detects images with Personal Protective Equipment.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- DynamoDB
- Amazon Rekognition
- Amazon S3
- Amazon SES

## Detect objects in images with Amazon Rekognition using an AWS SDK

### SDK for Java 2.x

Shows how to use Amazon Rekognition Java API to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

## Detect people and objects in a video with Amazon Rekognition using an AWS SDK

### SDK for Java 2.x

Shows how to use Amazon Rekognition Java API to create an app to detect faces and objects in videos located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

## Use API Gateway to invoke a Lambda function

### SDK for Java 2.x

Shows how to create an AWS Lambda function by using the Lambda Java runtime API. This example invokes different AWS services to perform a specific use case. This example demonstrates how to create a Lambda function invoked by Amazon API Gateway that scans an Amazon DynamoDB table for work anniversaries and uses Amazon Simple Notification Service (Amazon SNS) to send a text message to your employees that congratulates them at their one year anniversary date.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- API Gateway
- DynamoDB
- Lambda
- Amazon SNS

## Use Step Functions to invoke Lambda functions

### SDK for Java 2.x

Shows how to create an AWS serverless workflow by using AWS Step Functions and the AWS SDK for Java 2.x. Each workflow step is implemented using an AWS Lambda function.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- DynamoDB
- Lambda
- Amazon SES
- Step Functions

## Use scheduled events to invoke a Lambda function

### SDK for Java 2.x

Shows how to create an Amazon EventBridge scheduled event that invokes an AWS Lambda function. Configure EventBridge to use a cron expression to schedule when the Lambda function is invoked. In this example, you create a Lambda function by using the Lambda Java runtime API. This example invokes different AWS services to perform a specific use case. This example demonstrates how to create an app that sends a mobile text message to your employees that congratulates them at the one year anniversary date.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- DynamoDB
- EventBridge
- Lambda
- Amazon SNS

## Code examples for SDK for Kotlin

The code examples in this topic show you how to use the AWS SDK for Kotlin with AWS.

### Examples

- [Single-service actions and scenarios using SDK for Kotlin \(p. 3499\)](#)
- [Cross-service examples using SDK for Kotlin \(p. 3663\)](#)

## Single-service actions and scenarios using SDK for Kotlin

The following code examples show how to perform actions and implement common scenarios by using the AWS SDK for Kotlin with AWS services.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Services

- [Aurora examples using SDK for Kotlin \(p. 3500\)](#)
- [CloudWatch examples using SDK for Kotlin \(p. 3516\)](#)
- [CloudWatch Logs examples using SDK for Kotlin \(p. 3519\)](#)
- [Amazon Cognito Identity Provider examples using SDK for Kotlin \(p. 3520\)](#)
- [DynamoDB examples using SDK for Kotlin \(p. 3530\)](#)
- [Amazon EC2 Auto Scaling examples using SDK for Kotlin \(p. 3548\)](#)
- [EventBridge examples using SDK for Kotlin \(p. 3559\)](#)
- [AWS Glue examples using SDK for Kotlin \(p. 3561\)](#)
- [IAM examples using SDK for Kotlin \(p. 3568\)](#)
- [AWS KMS examples using SDK for Kotlin \(p. 3581\)](#)
- [Lambda examples using SDK for Kotlin \(p. 3587\)](#)
- [Amazon Pinpoint examples using SDK for Kotlin \(p. 3593\)](#)
- [Amazon RDS examples using SDK for Kotlin \(p. 3599\)](#)
- [Amazon Redshift examples using SDK for Kotlin \(p. 3609\)](#)
- [Amazon Rekognition examples using SDK for Kotlin \(p. 3612\)](#)
- [Amazon S3 examples using SDK for Kotlin \(p. 3623\)](#)
- [Amazon SNS examples using SDK for Kotlin \(p. 3632\)](#)
- [Amazon SQS examples using SDK for Kotlin \(p. 3639\)](#)
- [Secrets Manager examples using SDK for Kotlin \(p. 3643\)](#)
- [Step Functions examples using SDK for Kotlin \(p. 3646\)](#)
- [AWS Support examples using SDK for Kotlin \(p. 3649\)](#)

## Aurora examples using SDK for Kotlin

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Kotlin with Amazon Aurora.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3500\)](#)
- [Scenarios \(p. 3509\)](#)

## Actions

### Create a DB cluster

The following code example shows how to create an Aurora DB cluster.

#### SDK for Kotlin

##### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun createDBCluster(dbParameterGroupFamilyVal: String?, dbName: String?, dbClusterIdentifierVal: String?, userName: String?, password: String?): String? {
    val clusterRequest = CreateDbClusterRequest {
        databaseName = dbName
        dbClusterIdentifier = dbClusterIdentifierVal
        dbClusterParameterGroupName = dbParameterGroupFamilyVal
        engine = "aurora-mysql"
        masterUsername = userName
        masterUserPassword = password
    }

    RdsClient { region = "us-west-2" }.use { rdsClient ->
        val response = rdsClient.createDbCluster(clusterRequest)
        return response.dbCluster?.dbClusterArn
    }
}
```

- For API details, see [CreateDBCluster in AWS SDK for Kotlin API reference](#).

### Create a DB cluster parameter group

The following code example shows how to create an Aurora DB cluster parameter group.

#### SDK for Kotlin

##### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun createDBClusterParameterGroup(dbClusterGroupNameVal: String?,  
dbParameterGroupFamilyVal: String?) {  
    val groupRequest = CreateDbClusterParameterGroupRequest {  
        dbClusterParameterGroupName = dbClusterGroupNameVal  
        dbParameterGroupFamily = dbParameterGroupFamilyVal  
        description = "Created by using the AWS SDK for Kotlin"  
    }  
  
    RdsClient { region = "us-west-2" }.use { rdsClient ->  
        val response = rdsClient.createDbClusterParameterGroup(groupRequest)  
        println("The group name is  
${response.dbClusterParameterGroup?.dbClusterParameterGroupName}")  
    }  
}
```

- For API details, see [CreateDBClusterParameterGroup](#) in *AWS SDK for Kotlin API reference*.

## Create a DB cluster snapshot

The following code example shows how to create an Aurora DB cluster snapshot.

### SDK for Kotlin

**Note**

This is prerelease documentation for a feature in preview release. It is subject to change.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun createDBClusterSnapshot(dbInstanceClusterIdentifier: String?,  
dbSnapshotIdentifier: String?) {  
    val snapshotRequest = CreateDbClusterSnapshotRequest {  
        dbClusterIdentifier = dbInstanceClusterIdentifier  
        dbClusterSnapshotIdentifier = dbSnapshotIdentifier  
    }  
  
    RdsClient { region = "us-west-2" }.use { rdsClient ->  
        val response = rdsClient.createDbClusterSnapshot(snapshotRequest)  
        println("The Snapshot ARN is  
${response.dbClusterSnapshot?.dbClusterSnapshotArn}")  
    }  
}
```

- For API details, see [CreateDBClusterSnapshot](#) in *AWS SDK for Kotlin API reference*.

## Create a DB instance in a DB cluster

The following code example shows how to create a DB instance in an Aurora DB cluster.

### SDK for Kotlin

**Note**

This is prerelease documentation for a feature in preview release. It is subject to change.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun createDBInstanceCluster(dbInstanceIdentifierVal: String?,  
    dbInstanceClusterIdentifierVal: String?, instanceClassVal: String?): String? {  
    val instanceRequest = CreateDbInstanceRequest {  
        dbInstanceIdentifier = dbInstanceIdentifierVal  
        dbClusterIdentifier = dbInstanceClusterIdentifierVal  
        engine = "aurora-mysql"  
        dbInstanceClass = instanceClassVal  
    }  
  
    RdsClient { region = "us-west-2" }.use { rdsClient ->  
        val response = rdsClient.createDbInstance(instanceRequest)  
        print("The status is ${response.dbInstance?.dbInstanceState}")  
        return response.dbInstance?.dbInstanceArn  
    }  
}
```

- For API details, see [CreateDBInstance](#) in *AWS SDK for Kotlin API reference*.

## Delete a DB cluster

The following code example shows how to delete an Aurora DB cluster.

### SDK for Kotlin

**Note**

This is prerelease documentation for a feature in preview release. It is subject to change.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun deleteCluster(dbInstanceClusterIdentifier: String) {  
    val deleteDbClusterRequest = DeleteDbClusterRequest {  
        dbClusterIdentifier = dbInstanceClusterIdentifier  
        skipFinalSnapshot = true  
    }  
  
    RdsClient { region = "us-west-2" }.use { rdsClient ->  
        rdsClient.deleteDbCluster(deleteDbClusterRequest)  
        println("$dbInstanceClusterIdentifier was deleted!")  
    }  
}
```

- For API details, see [DeleteDBCluster](#) in *AWS SDK for Kotlin API reference*.

## Delete a DB cluster parameter group

The following code example shows how to delete an Aurora DB cluster parameter group.

### SDK for Kotlin

**Note**

This is prerelease documentation for a feature in preview release. It is subject to change.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
@Throws(InterruptedIOException::class)
suspend fun deleteDBClusterGroup(dbClusterGroupName: String, clusterDBARN: String) {
    var isDataDel = false
    var didFind: Boolean
    var instanceARN: String

    RdsClient { region = "us-west-2" }.use { rdsClient ->
        // Make sure that the database has been deleted.
        while (!isDataDel) {
            val response = rdsClient.describeDbInstances()
            val instanceList = response.dbInstances
            val listSize = instanceList?.size
            isDataDel = false
            didFind = false
            var index = 1
            if (instanceList != null) {
                for (instance in instanceList) {
                    instanceARN = instance.dbInstanceArn.toString()
                    if (instanceARN.compareTo(clusterDBARN) == 0) {
                        println("$clusterDBARN still exists")
                        didFind = true
                    }
                    if (index == listSize && !didFind) {

## Describe parameters from a DB cluster parameter group

The following code example shows how to describe parameters from an Aurora DB cluster parameter group.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun describeDbClusterParameters(dbClusterGroupName: String?, flag: Int) {  
    val dbParameterGroupsRequest: DescribeDbClusterParametersRequest  
    dbParameterGroupsRequest = if (flag == 0) {  
        DescribeDbClusterParametersRequest {  
            dbClusterParameterGroupName = dbClusterGroupName  
        }  
    } else {  
        DescribeDbClusterParametersRequest {  
            dbClusterParameterGroupName = dbClusterGroupName  
            source = "user"  
        }  
    }  
}
```

```
RdsClient { region = "us-west-2" }.use { rdsClient ->
    val response = rdsClient.describeDbClusterParameters(dbParameterGroupsRequest)
    response.parameters?.forEach { para ->
        // Only print out information about either auto_increment_offset or
        // auto_increment_incremetn.
        val paraName = para.parameterName
        if (paraName != null) {
            if (paraName.compareTo("auto_increment_offset") == 0 || paraName.compareTo("auto_increment_incremetn") == 0) {
                println("**** The parameter name is $paraName")
                println("**** The parameter value is ${para.parameterValue}")
                println("**** The parameter data type is ${para.dataType}")
                println("**** The parameter description is ${para.description}")
                println("**** The parameter allowed values is
${para.allowedValues}")
            }
        }
    }
}
```

- For API details, see [DescribeDBClusterParameters](#) in *AWS SDK for Kotlin API reference*.

## Update parameters in a DB cluster parameter group

The following code example shows how to update parameters in an Aurora DB cluster parameter group.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Modify the auto_increment_offset parameter.
suspend fun modifyDBClusterParas(dClusterGroupName: String?) {
    val parameter1 = Parameter {
        parameterName = "auto_increment_offset"
        applyMethod = ApplyMethod.fromValue("immediate")
        parameterValue = "5"
    }

    val paraList = ArrayList<Parameter>()
    paraList.add(parameter1)
    val groupRequest = ModifyDbClusterParameterGroupRequest {
        dbClusterParameterGroupName = dClusterGroupName
        parameters = paraList
    }

    RdsClient { region = "us-west-2" }.use { rdsClient ->
        val response = rdsClient.modifyDbClusterParameterGroup(groupRequest)
        println("The parameter group ${response.dbClusterParameterGroupName} was
successfully modified")
    }
}
```

- For API details, see [ModifyDBClusterParameterGroup](#) in *AWS SDK for Kotlin API reference*.

## Scenarios

### Get started with DB clusters

The following code example shows how to:

- Create a custom Aurora DB cluster parameter group and set parameter values.
- Create a DB cluster that is configured to use the parameter group.
- Create a DB instance in the DB cluster that contains a database.
- Take a snapshot of the DB cluster.
- Delete the instance, DB cluster, and parameter group.

#### SDK for Kotlin

##### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

##### Note

```
/**  
Before running this Kotlin code example, set up your development environment, including  
your credentials.  
  
For more information, see the following documentation topic:  
https://docs.aws.amazon.com/sdk-for-kotlin/latest/developer-guide/setup.html  
  
This Kotlin example performs the following tasks:  
  
1. Returns a list of the available DB engines.  
2. Creates a custom DB parameter group.  
3. Gets the parameter groups.  
4. Gets the parameters in the group.  
5. Modifies the auto_increment_increment parameter.  
6. Displays the updated parameter value.  
7. Gets a list of allowed engine versions.  
8. Creates an Aurora DB cluster database.  
9. Waits for DB instance to be ready.  
10. Gets a list of instance classes available for the selected engine.  
11. Creates a database instance in the cluster.  
12. Waits for the database instance in the cluster to be ready.  
13. Creates a snapshot.  
14. Waits for DB snapshot to be ready.  
15. Deletes the DB instance.  
16. Deletes the DB cluster.  
17. Deletes the DB cluster group.

## CloudWatch examples using SDK for Kotlin

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Kotlin with Amazon CloudWatch.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

## Actions

### Create an alarm that watches a metric

The following code example shows how to create an Amazon CloudWatch alarm that watches a metric.

## SDK for Kotlin

### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun putMetricAlarm(alarmNameVal: String, instanceIdVal: String) {

    val dimension0b = Dimension {
        name = "InstanceId"
        value = instanceIdVal
    }

    val request = PutMetricAlarmRequest {
        alarmName = alarmNameVal
        comparisonOperator = ComparisonOperator.GreaterThanThreshold
        evaluationPeriods = 1
        metricName = "CPUUtilization"
        namespace = "AWS/EC2"
        period = 60
        statistic = Statistic.fromValue("Average")
        threshold = 70.0
        actionsEnabled = false
        alarmDescription = "An Alarm created by the Kotlin SDK when server CPU
utilization exceeds 70%"
        unit = StandardUnit.fromValue("Seconds")
        dimensions = listOf(dimension0b)
    }

    CloudWatchClient { region = "us-east-1" }.use { cwClient ->
        cwClient.putMetricAlarm(request)
        println("Successfully created an alarm with name $alarmNameVal")
    }
}
```

- For API details, see [PutMetricAlarm in AWS SDK for Kotlin API reference](#).

## Delete alarms

The following code example shows how to delete Amazon CloudWatch alarms.

## SDK for Kotlin

### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun deleteCWAAlarm(alarmNameVal: String) {

    val request = DeleteAlarmsRequest {
        alarmNames = listOf(alarmNameVal)
    }

    CloudWatchClient { region = "us-east-1" }.use { cwClient ->
        cwClient.deleteAlarms(request)
    }
}
```

```
        println("Successfully deleted alarm $alarmNameVal")
    }
}
```

- For API details, see [DeleteAlarms](#) in *AWS SDK for Kotlin API reference*.

## Describe alarms for a metric

The following code example shows how to describe Amazon CloudWatch alarms for a metric.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun desCWAAlarms() {

    CloudWatchClient { region = "us-east-1" }.use { cwClient ->
        val response = cwClient.describeAlarms(DescribeAlarmsRequest {})
        response.metricAlarms?.forEach { alarm ->
            println("Retrieved alarm ${alarm.alarmName}")
        }
    }
}
```

- For API details, see [DescribeAlarmsForMetric](#) in *AWS SDK for Kotlin API reference*.

## Disable alarm actions

The following code example shows how to disable Amazon CloudWatch alarm actions.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun disableActions(alarmName: String) {

    val request = DisableAlarmActionsRequest {
        alarmNames = listOf(alarmName)
    }
    CloudWatchClient { region = "us-east-1" }.use { cwClient ->
        cwClient.disableAlarmActions(request)
        println("Successfully disabled actions on alarm $alarmName")
    }
}
```

- For API details, see [DisableAlarmActions](#) in *AWS SDK for Kotlin API reference*.

## Enable alarm actions

The following code example shows how to enable Amazon CloudWatch alarm actions.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun enableActions(alarm: String) {  
  
    val request = EnableAlarmActionsRequest {  
        alarmNames = listOf(alarm)  
    }  
  
    CloudWatchClient { region = "us-east-1" }.use { cwClient ->  
        cwClient.enableAlarmActions(request)  
        println("Successfully enabled actions on alarm $alarm")  
    }  
}
```

- For API details, see [EnableAlarmActions](#) in *AWS SDK for Kotlin API reference*.

## CloudWatch Logs examples using SDK for Kotlin

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Kotlin with Amazon CloudWatch Logs.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

## Actions

### Delete a subscription filter

The following code example shows how to delete an Amazon CloudWatch Logs subscription filter.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun deleteSubFilter(filter: String?, logGroup: String?) {  
  
    val request = DeleteSubscriptionFilterRequest {
```

```
        filterName = filter
        logGroupName = logGroup
    }

    CloudWatchLogsClient { region = "us-west-2" }.use { logs ->
        logs.deleteSubscriptionFilter(request)
        println("Successfully deleted CloudWatch logs subscription filter named
$filter")
    }
}
```

- For API details, see [DeleteSubscriptionFilter](#) in *AWS SDK for Kotlin API reference*.

## Describe existing subscription filters

The following code example shows how to describe Amazon CloudWatch Logs existing subscription filters.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun describeFilters(logGroup: String) {

    val request = DescribeSubscriptionFiltersRequest {
        logGroupName = logGroup
        limit = 1
    }

    CloudWatchLogsClient { region = "us-west-2" }.use { cwlClient ->
        val response = cwlClient.describeSubscriptionFilters(request)
        response.subscriptionFilters?.forEach { filter ->
            println("Retrieved filter with name ${filter.filterName} pattern
${filter.filterPattern} and destination ${filter.destinationArn}")
        }
    }
}
```

- For API details, see [DescribeSubscriptionFilters](#) in *AWS SDK for Kotlin API reference*.

## Amazon Cognito Identity Provider examples using SDK for Kotlin

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Kotlin with Amazon Cognito Identity Provider.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Scenarios \(p. 3526\)](#)

## Actions

### Confirm a user

The following code example shows how to confirm an Amazon Cognito user.

#### SDK for Kotlin

##### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun confirmSignUp(clientIdVal: String?, codeVal: String?, userNameVal: String?) {
    val signUpRequest = ConfirmSignUpRequest {
        clientId = clientIdVal
        confirmationCode = codeVal
        username = userNameVal
    }
    CognitoIdentityProviderClient { region = "us-east-1" }.use { identityProviderClient ->
        identityProviderClient.confirmSignUp(signUpRequest)
        println("$userNameVal was confirmed")
    }
}
```

- For API details, see [ConfirmSignUp in AWS SDK for Kotlin API reference](#).

### Get a token to associate an MFA application with a user

The following code example shows how to get a token to associate an MFA application with an Amazon Cognito user.

#### SDK for Kotlin

##### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun getSecretForAppMFA(sessionVal: String?): String? {
    val softwareTokenRequest = AssociateSoftwareTokenRequest {
        session = sessionVal
    }
    CognitoIdentityProviderClient { region = "us-east-1" }.use { identityProviderClient ->
```

```
    val tokenResponse =
identityProviderClient.associateSoftwareToken(softwareTokenRequest)
    val secretCode = tokenResponse.secretCode
    println("Enter this token into Google Authenticator")
    println(secretCode)
    return tokenResponse.session
}
}
```

- For API details, see [AssociateSoftwareToken](#) in *AWS SDK for Kotlin API reference*.

## Get information about a user

The following code example shows how to get information about an Amazon Cognito user.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun getAdminUser(userNameVal: String?, poolIdVal: String?) {

    val userRequest = Admin GetUserRequest {
        username = userNameVal
        userPoolId = poolIdVal
    }

    CognitoIdentityProviderClient { region = "us-east-1" }.use { identityProviderClient
    ->
        val response = identityProviderClient.admin GetUser(userRequest)
        println("User status ${response.userStatus}")
    }
}
```

- For API details, see [Admin GetUser](#) in *AWS SDK for Kotlin API reference*.

## List users

The following code example shows how to list Amazon Cognito users.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun listAllUsers(userPoolId: String) {

    val request = ListUsersRequest {
        this.userPoolId = userPoolId
    }
}
```

```
CognitoIdentityProviderClient { region = "us-east-1" }.use { cognitoClient ->
    val response = cognitoClient.listUsers(request)
    response.users?.forEach { user ->
        println("The user name is ${user.username}")
    }
}
```

- For API details, see [ListUsers](#) in *AWS SDK for Kotlin API reference*.

## Resend a confirmation code

The following code example shows how to resend an Amazon Cognito confirmation code.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun resendConfirmationCode(clientIdVal: String?, userNameVal: String?) {

    val codeRequest = ResendConfirmationCodeRequest {
        clientId = clientIdVal
        username = userNameVal
    }

    CognitoIdentityProviderClient { region = "us-east-1" }.use { identityProviderClient ->
        val response = identityProviderClient.resendConfirmationCode(codeRequest)
        println("Method of delivery is " +
            (response.codeDeliveryDetails?.deliveryMedium))
    }
}
```

- For API details, see [ResendConfirmationCode](#) in *AWS SDK for Kotlin API reference*.

## Respond to an authentication challenge

The following code example shows how to respond to an Amazon Cognito authentication challenge.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Respond to an authentication challenge.
suspend fun adminRespondToAuthChallenge(userName: String, clientIdVal: String?,
    mfaCode: String, sessionVal: String?) {

    println("SOFTWARE_TOKEN_MFA challenge is generated")
    val challengeResponses0b = mutableMapOf<String, String>()
```

```
challengeResponses0b["USERNAME"] = userName
challengeResponses0b["SOFTWARE_TOKEN_MFA_CODE"] = mfaCode

val respondToAuthChallengeRequest = RespondToAuthChallengeRequest {
    challengeName = ChallengeNameType.SoftwareTokenMfa
    clientId = clientIdVal
    challengeResponses = challengeResponses0b
    session = sessionVal
}

CognitoIdentityProviderClient { region = "us-east-1" }.use { identityProviderClient
->
    val respondToAuthChallengeResult =
        identityProviderClient.respondToAuthChallenge(respondToAuthChallengeRequest)
    println("respondToAuthChallengeResult.getAuthenticationResult()")
    ${respondToAuthChallengeResult.authenticationResult}
}
}
```

- For API details, see [AdminRespondToAuthChallenge](#) in *AWS SDK for Kotlin API reference*.

## Sign up a user

The following code example shows how to sign up a user with Amazon Cognito.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun signUp(clientIdVal: String?, userNameVal: String?, passwordVal: String?,
emailVal: String?) {

    val userAttrs = AttributeType {
        name = "email"
        value = emailVal
    }

    val userAttrsList = mutableListOf<AttributeType>()
    userAttrsList.add(userAttrs)

    val signUpRequest = SignUpRequest {
        userAttributes = userAttrsList
        username = userNameVal
        clientId = clientIdVal
        password = passwordVal
    }

    CognitoIdentityProviderClient { region = "us-east-1" }.use { identityProviderClient
->
        identityProviderClient.signUp(signUpRequest)
        println("User has been signed up")
    }
}
```

- For API details, see [SignUp](#) in *AWS SDK for Kotlin API reference*.

## Start authentication with administrator credentials

The following code example shows how to start authentication with Amazon Cognito and administrator credentials.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun initiateAuth(clientIdVal: String?, userNameVal: String, passwordVal: String): InitiateAuthResponse {  
  
    val authParas = mutableMapOf <String, String>()  
    authParas["USERNAME"] = userNameVal  
    authParas["PASSWORD"] = passwordVal  
  
    val authRequest = InitiateAuthRequest {  
        clientId = clientIdVal  
        authParameters = authParas  
        authFlow = AuthFlowType.UserPasswordAuth  
    }  
  
    CognitoIdentityProviderClient { region = "us-east-1" }.use { identityProviderClient ->  
        val response = identityProviderClient.initiateAuth(authRequest)  
        println("Result Challenge is ${response.challengeName}")  
        return response  
    }  
}
```

- For API details, see [AdminInitiateAuth](#) in *AWS SDK for Kotlin API reference*.

## Verify an MFA application with a user

The following code example shows how to verify an MFA application with an Amazon Cognito user.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Verify the TOTP and register for MFA.  
suspend fun verifyTOTP(sessionVal: String?, codeVal: String?) {  
  
    val tokenRequest = VerifySoftwareTokenRequest {  
        userCode = codeVal  
        session = sessionVal  
    }  
  
    CognitoIdentityProviderClient { region = "us-east-1" }.use { identityProviderClient ->
```

```
        val verifyResponse = identityProviderClient.verifySoftwareToken(tokenRequest)
        println("The status of the token is ${verifyResponse.status}")
    }
```

- For API details, see [VerifySoftwareToken](#) in *AWS SDK for Kotlin API reference*.

## Scenarios

### Sign up a user with a user pool that requires MFA

The following code example shows how to:

- Sign up a user with a user name, password, and email address.
- Confirm the user from a code sent in email.
- Set up multi-factor authentication by associating an MFA application with the user.
- Sign in by using a password and an MFA code.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/**
Before running this Kotlin code example, set up your development environment,
including your credentials.

For more information, see the following documentation:
https://docs.aws.amazon.com/sdk-for-kotlin/latest/developer-guide/setup.html

TIP: To set up the required user pool, run the AWS Cloud Development
Kit (AWS CDK) script provided in this GitHub repo at resources/cdk/
cognito_scenario_user_pool_with_mfa.

This code example performs the following operations:

1. Invokes the signUp method to sign up a user.
2. Invokes the adminGetUser method to get the user's confirmation status.
3. Invokes the ResendConfirmationCode method if the user requested another code.
4. Invokes the confirmSignUp method.
5. Invokes the initiateAuth to sign in. This results in being prompted to set up TOTP
(time-based one-time password). (The response is "ChallengeName": "MFA_SETUP").
6. Invokes the AssociateSoftwareToken method to generate a TOTP MFA private key. This
can be used with Google Authenticator.
7. Invokes the VerifySoftwareToken method to verify the TOTP and register for MFA.
8. Invokes the AdminInitiateAuth to sign in again. This results in being prompted to
submit a TOTP (Response: "ChallengeName": "SOFTWARE_TOKEN_MFA").
9. Invokes the AdminRespondToAuthChallenge to get back a token.
*/
```

```
suspend fun main(args: Array<String>) {

    val usage = """
        Usage:
            <clientId> <poolId>
```

```

    Where:
        clientId - The app client Id value that you can get from the AWS CDK
script.
        poolId - The pool Id that you can get from the AWS CDK script.
    """

## DynamoDB examples using SDK for Kotlin

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Kotlin with Amazon DynamoDB.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3530\)](#)
- [Scenarios \(p. 3536\)](#)

## Actions

### Create a table

The following code example shows how to create a DynamoDB table.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun createNewTable(tableNameVal: String, key: String): String? {  
  
    val attDef = AttributeDefinition {  
        attributeName = key  
        attributeType = ScalarAttributeType.S  
    }  
  
    val keySchemaVal = KeySchemaElement {  
        attributeName = key  
        keyType = KeyType.Hash  
    }  
  
    val provisionedVal = ProvisionedThroughput {  
        readCapacityUnits = 10  
        writeCapacityUnits = 10  
    }  
  
    val request = CreateTableRequest {  
        attributeDefinitions = listOf(attDef)  
        keySchema = listOf(keySchemaVal)  
        provisionedThroughput = provisionedVal  
        tableName = tableNameVal  
    }  
  
    DynamoDbClient { region = "us-east-1" }.use { ddb ->  
  
        var tableArn: String  
        val response = ddb.createTable(request)  
        ddb.waitUntilTableExists { // suspend call  
            tableName = tableNameVal  
        }  
        tableArn = response.tableDescription!!.tableArn.toString()  
        println("Table $tableArn is ready")  
        return tableArn  
    }  
}
```

- For API details, see [CreateTable](#) in *AWS SDK for Kotlin API reference*.

## Delete a table

The following code example shows how to delete a DynamoDB table.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun deleteDynamoDBTable(tableNameVal: String) {  
  
    val request = DeleteTableRequest {  
        tableName = tableNameVal  
    }  
  
    DynamoDbClient { region = "us-east-1" }.use { ddb ->  
        ddb.deleteTable(request)  
        println("$tableNameVal was deleted")  
    }  
}
```

```
    }
```

- For API details, see [DeleteTable](#) in *AWS SDK for Kotlin API reference*.

## Delete an item from a table

The following code example shows how to delete an item from a DynamoDB table.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun deleteDymamoDBItem(tableNameVal: String, keyName: String, keyVal: String) {  
  
    val keyToGet = mutableMapOf<String, AttributeValue>()  
    keyToGet[keyName] = AttributeValue.S(keyVal)  
  
    val request = DeleteItemRequest {  
        tableName = tableNameVal  
        key = keyToGet  
    }  
  
    DynamoDbClient { region = "us-east-1" }.use { ddb ->  
        ddb.deleteItem(request)  
        println("Item with key matching $keyVal was deleted")  
    }  
}
```

- For API details, see [DeleteItem](#) in *AWS SDK for Kotlin API reference*.

## Get an item from a table

The following code example shows how to get an item from a DynamoDB table.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun getSpecificItem(tableNameVal: String, keyName: String, keyVal: String) {  
  
    val keyToGet = mutableMapOf<String, AttributeValue>()  
    keyToGet[keyName] = AttributeValue.S(keyVal)  
  
    val request = GetItemRequest {  
        key = keyToGet  
        tableName = tableNameVal  
    }  
}
```

```
DynamoDbClient { region = "us-east-1" }.use { ddb ->
    val returnedItem = ddb.getItem(request)
    val numbersMap = returnedItem.item
    numbersMap?.forEach { key1 ->
        println(key1.key)
        println(key1.value)
    }
}
```

- For API details, see [GetItem](#) in *AWS SDK for Kotlin API reference*.

## List tables

The following code example shows how to list DynamoDB tables.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun listAllTables() {

    DynamoDbClient { region = "us-east-1" }.use { ddb ->
        val response = ddb.listTables(ListTablesRequest {})
        response.tableNames?.forEach { tableName ->
            println("Table name is $tableName")
        }
    }
}
```

- For API details, see [ListTables](#) in *AWS SDK for Kotlin API reference*.

## Put an item in a table

The following code example shows how to put an item in a DynamoDB table.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun putItemInTable(
    tableNameVal: String,
    key: String,
    keyVal: String,
    albumTitle: String,
    albumTitleValue: String,
    awards: String,
```

```
        awardVal: String,
        songTitle: String,
        songTitleVal: String
    ) {
    val itemValues = mutableMapOf<String, AttributeValue>()

    // Add all content to the table.
    itemValues[key] = AttributeValue.S(keyVal)
    itemValues[songTitle] = AttributeValue.S(songTitleVal)
    itemValues[albumTitle] = AttributeValue.S(albumTitleValue)
    itemValues[awards] = AttributeValue.S(awardVal)

    val request = PutItemRequest {
        tableName = tableNameVal
        item = itemValues
    }

    DynamoDbClient { region = "us-east-1" }.use { ddb ->
        ddb.putItem(request)
        println(" A new item was placed into $tableNameVal.")
    }
}
```

- For API details, see [PutItem](#) in *AWS SDK for Kotlin API reference*.

## Query a table

The following code example shows how to query a DynamoDB table.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun queryDynTable(
    tableNameVal: String,
    partitionKeyName: String,
    partitionKeyVal: String,
    partitionAlias: String
): Int {

    val attrNameAlias = mutableMapOf<String, String>()
    attrNameAlias[partitionAlias] = partitionKeyName

    // Set up mapping of the partition name with the value.
    val attrValues = mutableMapOf<String, AttributeValue>()
    attrValues[":$partitionKeyName"] = AttributeValue.S(partitionKeyVal)

    val request = QueryRequest {
        tableName = tableNameVal
        keyConditionExpression = "$partitionAlias = :$partitionKeyName"
        expressionAttributeNames = attrNameAlias
        this.expressionAttributeValues = attrValues
    }

    DynamoDbClient { region = "us-east-1" }.use { ddb ->
        val response = ddb.query(request)
        return response.count
    }
}
```

```
    }
```

- For API details, see [Query](#) in *AWS SDK for Kotlin API reference*.

## Scan a table

The following code example shows how to scan a DynamoDB table.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun scanItems(tableNameVal: String) {  
  
    val request = ScanRequest {  
        tableName = tableNameVal  
    }  
  
    DynamoDbClient { region = "us-east-1" }.use { ddb ->  
        val response = ddb.scan(request)  
        response.items?.forEach { item ->  
            item.keys.forEach { key ->  
                println("The key name is $key\n")  
                println("The value is ${item[key]}")  
            }  
        }  
    }  
}
```

- For API details, see [Scan](#) in *AWS SDK for Kotlin API reference*.

## Update an item in a table

The following code example shows how to update an item in a DynamoDB table.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun updateTableItem(  
    tableNameVal: String,  
    keyName: String,  
    keyVal: String,  
    name: String,  
    updateVal: String  
) {  
  
    val itemKey = mutableMapOf<String, AttributeValue>()
```

```
    itemKey[keyName] = AttributeValue.S(keyVal)

    val updatedValues = mutableMapOf<String, AttributeValueUpdate>()
    updatedValues[name] = AttributeValueUpdate {
        value = AttributeValue.S(updateVal)
        action = AttributeAction.Put
    }

    val request = UpdateItemRequest {
        tableName = tableNameVal
        key = itemKey
        attributeUpdates = updatedValues
    }

    DynamoDbClient { region = "us-east-1" }.use { ddb ->
        ddb.updateItem(request)
        println("Item in $tableNameVal was updated")
    }
}
```

- For API details, see [UpdateItem](#) in *AWS SDK for Kotlin API reference*.

## Scenarios

### Get started using tables, items, and queries

The following code example shows how to:

- Create a table that can hold movie data.
- Put, get, and update a single movie in the table.
- Write movie data to the table from a sample JSON file.
- Query for movies that were released in a given year.
- Scan for movies that were released in a range of years.
- Delete a movie from the table.
- Delete the table.

## SDK for Kotlin

### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a DynamoDB table.

```
suspend fun createScenarioTable(tableNameVal: String, key: String) {

    val attDef = AttributeDefinition {
        attributeName = key
        attributeType = ScalarAttributeType.N
    }

    val attDef1 = AttributeDefinition {
        attributeName = "title"
        attributeType = ScalarAttributeType.S
    }
```

```

val keySchemaVal = KeySchemaElement {
    attributeName = key
    keyType = KeyType.Hash
}

val keySchemaVal1 = KeySchemaElement {
    attributeName = "title"
    keyType = KeyType.Range
}

val provisionedVal = ProvisionedThroughput {
    readCapacityUnits = 10
    writeCapacityUnits = 10
}

val request = CreateTableRequest {
    attributeDefinitions = listOf(attDef, attDef1)
    keySchema = listOf(keySchemaVal, keySchemaVal1)
    provisionedThroughput = provisionedVal
    tableName = tableNameVal
}

DynamoDbClient { region = "us-east-1" }.use { ddb ->

    val response = ddb.createTable(request)
    ddb.waitUntilTableExists { // suspend call
        tableName = tableNameVal
    }
    println("The table was successfully created
    ${response.tableDescription?.tableArn}")
}
}

```

Create a helper function to download and extract the sample JSON file.

```

// Load data into the table.
suspend fun loadData(tableName: String, fileName: String) {

    val parser = JsonFactory().createParser(File(fileName))
    val rootNode = ObjectMapper().readTree<JsonNode>(parser)
    val iter: Iterator<JsonNode> = rootNode.iterator()
    var currentNode: ObjectNode

    var t = 0
    while (iter.hasNext()) {

        if (t == 50)
            break

        currentNode = iter.next() as ObjectNode
        val year = currentNode.path("year").asInt()
        val title = currentNode.path("title").asText()
        val info = currentNode.path("info").toString()
        putMovie(tableName, year, title, info)
        t++
    }
}

suspend fun putMovie(
    tableNameVal: String,
    year: Int,
    title: String,
    info: String
) {
}

```

```
val itemValues = mutableMapOf<String, AttributeValue>()
val strVal = year.toString()
// Add all content to the table.
itemValues["year"] = AttributeValue.N(strVal)
itemValues["title"] = AttributeValue.S(title)
itemValues["info"] = AttributeValue.S(info)

val request = PutItemRequest {
    tableName = tableNameVal
    item = itemValues
}

DynamoDbClient { region = "us-east-1" }.use { ddb ->
    ddb.putItem(request)
    println("Added $title to the Movie table.")
}
}
```

Get an item from a table.

```
suspend fun getMovie(tableNameVal: String, keyName: String, keyVal: String) {

    val keyToGet = mutableMapOf<String, AttributeValue>()
    keyToGet[keyName] = AttributeValue.N(keyVal)
    keyToGet["title"] = AttributeValue.S("King Kong")

    val request = GetItemRequest {
        key = keyToGet
        tableName = tableNameVal
    }

    DynamoDbClient { region = "us-east-1" }.use { ddb ->
        val returnedItem = ddb.getItem(request)
        val numbersMap = returnedItem.item
        numbersMap?.forEach { key1 ->
            println(key1.key)
            println(key1.value)
        }
    }
}
```

Full example.

```
suspend fun main(args: Array<String>) {

    val usage = """
        Usage:
        <fileName>

        Where:
        fileName - The path to the moviedata.json you can download from the Amazon
        DynamoDB Developer Guide.
    """

    if (args.size != 1) {
        println(usage)
        exitProcess(1)
    }

    // Get the moviedata.json from the Amazon DynamoDB Developer Guide.
    val tableName = "Movies"
    val fileName = args[0]
```

```
    val partitionAlias = "#a"

    println("Creating an Amazon DynamoDB table named Movies with a key named id and a
sort key named title.")
    createScenarioTable(tableName, "year")
    loadData(tableName, fileName)
    getMovie(tableName, "year", "1933")
    scanMovies(tableName)
    val count = queryMovieTable(tableName, "year", partitionAlias)
    println("There are $count Movies released in 2013.")
    deleteIssuesTable(tableName)
}

suspend fun createScenarioTable(tableNameVal: String, key: String) {

    val attDef = AttributeDefinition {
        attributeName = key
        attributeType = ScalarAttributeType.N
    }

    val attDef1 = AttributeDefinition {
        attributeName = "title"
        attributeType = ScalarAttributeType.S
    }

## Query a table by using batches of PartiQL statements

The following code example shows how to:

- Get a batch of items by running multiple SELECT statements.
- Add a batch of items by running multiple INSERT statements.
- Update a batch of items by running multiple UPDATE statements.
- Delete a batch of items by running multiple DELETE statements.

## Query a table using PartiQL

The following code example shows how to:

- Get an item by running a SELECT statement.
- Add an item by running an INSERT statement.
- Update an item by running an UPDATE statement.
- Delete an item by running a DELETE statement.

### SDK for Kotlin

## Amazon EC2 Auto Scaling examples using SDK for Kotlin

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Kotlin with Amazon EC2 Auto Scaling.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3549\)](#)
- [Scenarios \(p. 3554\)](#)

## Actions

### Create a group

The following code example shows how to create an Auto Scaling group.

#### SDK for Kotlin

##### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun createAutoScalingGroup(groupName: String, launchTemplateNameVal: String,  
serviceLinkedRoleARNVal: String, vpcZoneIdVal: String) {  
    val templateSpecification = LaunchTemplateSpecification {  
        launchTemplateName = launchTemplateNameVal  
    }  
  
    val request = CreateAutoScalingGroupRequest {  
        autoScalingGroupName = groupName  
        availabilityZones = listOf("us-east-1a")  
        launchTemplate = templateSpecification  
        maxSize = 1  
        minSize = 1  
        vpcZoneIdentifier = vpcZoneIdVal  
        serviceLinkedRoleArn = serviceLinkedRoleARNVal  
    }  
  
    // This object is required for the waiter call.  
    val groupsRequestWaiter = DescribeAutoScalingGroupsRequest {  
        autoScalingGroupNames = listOf(groupName)  
    }  
  
    AutoScalingClient { region = "us-east-1" }.use { autoScalingClient ->  
        autoScalingClient.createAutoScalingGroup(request)  
        autoScalingClient.waitUntilGroupExists(groupsRequestWaiter)  
        println("$groupName was created!")  
    }  
}
```

- For API details, see [CreateAutoScalingGroup](#) in *AWS SDK for Kotlin API reference*.

### Delete a group

The following code example shows how to delete an Auto Scaling group.

#### SDK for Kotlin

##### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun deleteSpecificAutoScalingGroup(groupName: String) {  
    val deleteAutoScalingGroupRequest = DeleteAutoScalingGroupRequest {
```

```
        autoScalingGroupName = groupName
        forceDelete = true
    }

    AutoScalingClient { region = "us-east-1" }.use { autoScalingClient ->
        autoScalingClient.deleteAutoScalingGroup(deleteAutoScalingGroupRequest)
    }
}
```

- For API details, see [DeleteAutoScalingGroup](#) in *AWS SDK for Kotlin API reference*.

## Disable metrics collection for a group

The following code example shows how to disable CloudWatch metrics collection for an Auto Scaling group.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun disableMetricsCollection(groupName: String) {
    val disableMetricsCollectionRequest = DisableMetricsCollectionRequest {
        autoScalingGroupName = groupName
        metrics = listOf("GroupMaxSize")
    }

    AutoScalingClient { region = "us-east-1" }.use { autoScalingClient ->
        autoScalingClient.disableMetricsCollection(disableMetricsCollectionRequest)
        println("The disable metrics collection operation was successful")
    }
}
```

- For API details, see [DisableMetricsCollection](#) in *AWS SDK for Kotlin API reference*.

## Enable metrics collection for a group

The following code example shows how to enable CloudWatch metrics collection for an Auto Scaling group.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun enableMetricsCollection(groupName: String?) {
    val collectionRequest = EnableMetricsCollectionRequest {
        autoScalingGroupName = groupName
    }
}
```

```
        metrics = listOf("GroupMaxSize")
        granularity = "1Minute"
    }

    AutoScalingClient { region = "us-east-1" }.use { autoScalingClient ->
        autoScalingClient.enableMetricsCollection(collectionRequest)
        println("The enable metrics collection operation was successful")
    }
}
```

- For API details, see [EnableMetricsCollection](#) in *AWS SDK for Kotlin API reference*.

## Get information about groups

The following code example shows how to get information about Auto Scaling groups.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun getAutoScalingGroups(groupName: String) {
    val scalingGroupsRequest = DescribeAutoScalingGroupsRequest {
        autoScalingGroupNames = listOf(groupName)
    }

    AutoScalingClient { region = "us-east-1" }.use { autoScalingClient ->
        val response =
            autoScalingClient.describeAutoScalingGroups(scalingGroupsRequest)
        response.autoScalingGroups?.forEach { group ->
            println("The group name is ${group.autoScalingGroupName}")
            println("The group ARN is ${group.autoScalingGroupArn}")
            group.instances?.forEach { instance ->
                println("The instance id is ${instance.instanceId}")
                println("The lifecycle state is " + instance.lifecycleState)
            }
        }
    }
}
```

- For API details, see [DescribeAutoScalingGroups](#) in *AWS SDK for Kotlin API reference*.

## Get information about instances

The following code example shows how to get information about Auto Scaling instances.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun describeAutoScalingInstance(id: String) {
    val describeAutoScalingInstancesRequest = DescribeAutoScalingInstancesRequest {
        instanceIds = listOf(id)
    }

    AutoScalingClient { region = "us-east-1" }.use { autoScalingClient ->
        val response =
            autoScalingClient.describeAutoScalingInstances(describeAutoScalingInstancesRequest)
        response.autoScalingInstances?.forEach { group ->
            println("The instance lifecycle state is: ${group.lifecycleState}")
        }
    }
}
```

- For API details, see [DescribeAutoScalingInstances](#) in *AWS SDK for Kotlin API reference*.

## Get information about scaling activities

The following code example shows how to get information about Auto Scaling activities.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun describeAutoScalingGroups(groupName: String) {
    val groupsReques = DescribeAutoScalingGroupsRequest {
        autoScalingGroupNames = listOf(groupName)
        maxRecords = 10
    }

    AutoScalingClient { region = "us-east-1" }.use { autoScalingClient ->
        val response = autoScalingClient.describeAutoScalingGroups(groupsReques)
        response.autoScalingGroups?.forEach { group ->
            println("The service to use for the health checks:
${group.healthCheckType}")
        }
    }
}
```

- For API details, see [DescribeScalingActivities](#) in *AWS SDK for Kotlin API reference*.

## Set the desired capacity of a group

The following code example shows how to set the desired capacity of an Auto Scaling group.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun setDesiredCapacity(groupName: String) {
    val capacityRequest = SetDesiredCapacityRequest {
        autoScalingGroupName = groupName
        desiredCapacity = 2
    }

    AutoScalingClient { region = "us-east-1" }.use { autoScalingClient ->
        autoScalingClient.setDesiredCapacity(capacityRequest)
        println("You set the DesiredCapacity to 2")
    }
}
```

- For API details, see [SetDesiredCapacity](#) in *AWS SDK for Kotlin API reference*.

## Terminate an instance in a group

The following code example shows how to terminate an instance in an Auto Scaling group.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun terminateInstanceInAutoScalingGroup(instanceIdVal: String) {
    val request = TerminateInstanceInAutoScalingGroupRequest {
        instanceId = instanceIdVal
        shouldDecrementDesiredCapacity = false
    }

    AutoScalingClient { region = "us-east-1" }.use { autoScalingClient ->
        autoScalingClient.terminateInstanceInAutoScalingGroup(request)
        println("You have terminated instance $instanceIdVal")
    }
}
```

- For API details, see [TerminateInstanceInAutoScalingGroup](#) in *AWS SDK for Kotlin API reference*.

## Update a group

The following code example shows how to update the configuration for an Auto Scaling group.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun updateAutoScalingGroup(groupName: String, launchTemplateNameVal: String,
    serviceLinkedRoleARNVal: String) {
```

```
val templateSpecification = LaunchTemplateSpecification {  
    launchTemplateName = launchTemplateNameVal  
}  
  
val groupRequest = UpdateAutoScalingGroupRequest {  
    maxSize = 3  
    serviceLinkedRoleArn = serviceLinkedRoleARNVal  
    autoScalingGroupName = groupName  
    launchTemplate = templateSpecification  
}  
  
val groupsRequestWaiter = DescribeAutoScalingGroupsRequest {  
    autoScalingGroupNames = listOf(groupName)  
}  
  
AutoScalingClient { region = "us-east-1" }.use { autoScalingClient ->  
    autoScalingClient.updateAutoScalingGroup(groupRequest)  
    autoScalingClient.waitUntilGroupExists(groupsRequestWaiter)  
    println("You successfully updated the Auto Scaling group $groupName")  
}  
}
```

- For API details, see [UpdateAutoScalingGroup in AWS SDK for Kotlin API reference](#).

## Scenarios

### Manage groups and instances

The following code example shows how to:

- Create an Amazon EC2 Auto Scaling group and configure it with a launch template and Availability Zones.
- Get information about the group and running instances.
- Enable Amazon CloudWatch metrics collection on the group.
- Update the desired capacity of the group and wait for an instance to start.
- Terminate an instance in the group.
- List scaling activities that occur in response to user requests and capacity changes.
- Get statistics for CloudWatch metrics that are collected during the example.
- Stop collecting metrics, terminate all instances, and delete the group.

### SDK for Kotlin

#### Note

## EventBridge examples using SDK for Kotlin

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Kotlin with Amazon EventBridge.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3559\)](#)

## Actions

### Create a scheduled rule

The following code example shows how to create an Amazon EventBridge scheduled rule.

#### SDK for Kotlin

##### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun createScRule(ruleName: String?, cronExpression: String?) {
    val ruleRequest = PutRuleRequest {
        name = ruleName
        eventBusName = "default"
        scheduleExpression = cronExpression
        state = RuleState.Enabled
        description = "A test rule that runs on a schedule created by the Kotlin API"
    }

    EventBridgeClient { region = "us-west-2" }.use { eventBrClient ->
        val ruleResponse = eventBrClient.putRule(ruleRequest)
        println("The ARN of the new rule is ${ruleResponse.ruleArn}")
    }
}
```

- For API details, see [PutRule](#) in *AWS SDK for Kotlin API reference*.

## Delete a scheduled rule

The following code example shows how to delete an Amazon EventBridge scheduled rule.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun deleteEBRule(ruleName: String) {

    val request = DisableRuleRequest {
        name = ruleName
        eventBusName = "default"
    }

    EventBridgeClient { region = "us-west-2" }.use { eventBrClient ->
        eventBrClient.disableRule(request)
        val ruleRequest = DeleteRuleRequest {
            name = ruleName
            eventBusName = "default"
        }

        eventBrClient.deleteRule(ruleRequest)
        println("Rule $ruleName was successfully deleted!")
    }
}
```

- For API details, see [DeleteRule](#) in *AWS SDK for Kotlin API reference*.

## Send events

The following code example shows how to send Amazon EventBridge events.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

**Note**

## SDK for Kotlin

### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun getSpecificCrawler(crawlerName: String?) {  
    val request = GetCrawlerRequest {
```

```
        name = crawlerName
    }
    GlueClient { region = "us-east-1" }.use { glueClient ->
        val response = glueClient.getCrawler(request)
        val role = response.crawler?.role
        println("The role associated with this crawler is $role")
    }
}
```

- For API details, see [GetCrawler](#) in *AWS SDK for Kotlin API reference*.

## Get a database from the Data Catalog

The following code example shows how to get a database from the AWS Glue Data Catalog.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun getSpecificDatabase(databaseName: String?) {

    val request = GetDatabaseRequest {
        name = databaseName
    }

    GlueClient { region = "us-east-1" }.use { glueClient ->
        val response = glueClient.getDatabase(request)
        val dbDesc = response.database?.description
        println("The database description is $dbDesc")
    }
}
```

- For API details, see [GetDatabase](#) in *AWS SDK for Kotlin API reference*.

## Start a crawler

The following code example shows how to start an AWS Glue crawler.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun startSpecificCrawler(crawlerName: String?) {

    val request = StartCrawlerRequest {
        name = crawlerName
    }
}
```

```
        GlueClient { region = "us-west-2" }.use { glueClient ->
            glueClient.startCrawler(request)
            println("$crawlerName was successfully started.")
        }
    }
```

- For API details, see [StartCrawler](#) in *AWS SDK for Kotlin API reference*.

## Scenarios

### Get started running crawlers and jobs

The following code example shows how to:

- Create and run a crawler that crawls a public Amazon Simple Storage Service (Amazon S3) bucket and generates a metadata database that describes the CSV-formatted data it finds.
- List information about databases and tables in your AWS Glue Data Catalog.
- Create and run a job that extracts CSV data from the source Amazon S3 bucket, transforms it by removing and renaming fields, and loads JSON-formatted output into another Amazon S3 bucket.
- List information about job runs and view some of the transformed data.
- Delete all resources created by the demo.

For more information, see [Tutorial: Getting started with AWS Glue Studio](#).

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun main(args: Array<String>) {

    val usage = """
        Usage:
            <iام> <s3Path> <cron> <dbName> <crawlerName> <jobName> <scriptLocation>
        <locationUri>

        Where:
            iam - The Amazon Resource Name (ARN) of the AWS Identity and Access
            Management (IAM) role that has AWS Glue and Amazon Simple Storage Service (Amazon S3)
            permissions.
            s3Path - The Amazon Simple Storage Service (Amazon S3) target that contains
            data (for example, CSV data).
            cron - A cron expression used to specify the schedule (for example, cron(15
            12 * * ? *)).
            dbName - The database name.
            crawlerName - The name of the crawler.
            jobName - The name you assign to this job definition.
            scriptLocation - Specifies the Amazon S3 path to a script that runs a job.
            locationUri - Specifies the location of the database
        """

## IAM examples using SDK for Kotlin

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Kotlin with AWS Identity and Access Management.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3569\)](#)
- [Scenarios \(p. 3577\)](#)

## Actions

### Attach a policy to a role

The following code example shows how to attach an IAM policy to a role.

#### SDK for Kotlin

##### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun attachIAMRolePolicy(roleNameVal: String, policyArnVal: String) {  
  
    val request = ListAttachedRolePoliciesRequest {  
        roleName = roleNameVal  
    }  
  
    IamClient { region = "AWS_GLOBAL" }.use { iamClient ->  
        val response = iamClient.listAttachedRolePolicies(request)  
        val attachedPolicies = response.attachedPolicies  
  
        // Ensure that the policy is not attached to this role.  
        val checkStatus: Int  
        if (attachedPolicies != null) {  
            checkStatus = checkList(attachedPolicies, policyArnVal)  
            if (checkStatus == -1)  
                return  
        }  
  
        val policyRequest = AttachRolePolicyRequest {  
            roleName = roleNameVal  
            policyArn = policyArnVal  
        }  
        iamClient.attachRolePolicy(policyRequest)  
        println("Successfully attached policy $policyArnVal to role $roleNameVal")  
    }  
}  
  
fun checkList(attachedPolicies: List<AttachedPolicy>, policyArnVal: String): Int {  
  
    for (policy in attachedPolicies) {  
        val polArn = policy.policyArn.toString()  
  
        if (polArn.compareTo(policyArnVal) == 0) {  
            println("The policy is already attached to this role.")  
            return -1  
        }  
    }  
    return 0  
}
```

    val request = DeleteAccountAliasRequest {  
        accountAlias = alias  
    }  
}
```

```
IamClient { region = "AWS_GLOBAL" }.use { iamClient ->
    iamClient.deleteAccountAlias(request)
    println("Successfully deleted account alias $alias")
}
```

- For API details, see [DeleteAccountAlias](#) in *AWS SDK for Kotlin API reference*.

## Detach a policy from a role

The following code example shows how to detach an IAM policy from a role.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun detachPolicy(roleNameVal: String, policyArnVal: String) {

    val request = DetachRolePolicyRequest {
        roleName = roleNameVal
        policyArn = policyArnVal
    }

    IamClient { region = "AWS_GLOBAL" }.use { iamClient ->
        iamClient.detachRolePolicy(request)
        println("Successfully detached policy $policyArnVal from role $roleNameVal")
    }
}
```

- For API details, see [DetachRolePolicy](#) in *AWS SDK for Kotlin API reference*.

## Get a policy

The following code example shows how to get an IAM policy.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun getIAMPolicy(policyArnVal: String?) {

    val request = GetPolicyRequest {
        policyArn = policyArnVal
    }

    IamClient { region = "AWS_GLOBAL" }.use { iamClient ->
        val response = iamClient.getPolicy(request)
    }
}
```

```
        println("Successfully retrieved policy ${response.policy?.policyName}")
    }
}
```

- For API details, see [GetPolicy](#) in *AWS SDK for Kotlin API reference*.

## List a user's access keys

The following code example shows how to list a user's IAM access keys.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun listKeys(userNameVal: String?) {

    val request = ListAccessKeysRequest {
        userName = userNameVal
    }
    IamClient { region = "AWS_GLOBAL" }.use { iamClient ->
        val response = iamClient.listAccessKeys(request)
        response.accessKeyMetadata?.forEach { md ->
            println("Retrieved access key ${md.accessKeyId}")
        }
    }
}
```

- For API details, see [ListAccessKeys](#) in *AWS SDK for Kotlin API reference*.

## List account aliases

The following code example shows how to list IAM account aliases.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun listAliases() {

    IamClient { region = "AWS_GLOBAL" }.use { iamClient ->
        val response = iamClient.listAccountAliases(ListAccountAliasesRequest {})
        response.accountAliases?.forEach { alias ->
            println("Retrieved account alias $alias")
        }
    }
}
```

- For API details, see [ListAccountAliases](#) in *AWS SDK for Kotlin API reference*.

## List users

The following code example shows how to list IAM users.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun listAllUsers() {  
  
    IamClient { region = "AWS_GLOBAL" }.use { iamClient ->  
        val response = iamClient.listUsers(ListUsersRequest { })  
        response.users?.forEach { user ->  
            println("Retrieved user ${user.userName}")  
            val permissionsBoundary = user.permissionsBoundary  
            if (permissionsBoundary != null)  
                println("Permissions boundary details  
${permissionsBoundary.permissionsBoundaryType}")  
        }  
    }  
}
```

- For API details, see [ListUsers](#) in *AWS SDK for Kotlin API reference*.

## Update a user

The following code example shows how to update an IAM user.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun updateIAMUser(curName: String?, newName: String?) {  
  
    val request = UpdateUserRequest {  
        userName = curName  
        newUserName = newName  
    }  
  
    IamClient { region = "AWS_GLOBAL" }.use { iamClient ->  
        iamClient.updateUser(request)  
        println("Successfully updated user to $newName")  
    }  
}
```

- For API details, see [UpdateUser](#) in *AWS SDK for Kotlin API reference*.

## Scenarios

### Create a user and assume a role

The following code example shows how to:

- Create a user who has no permissions.
- Create a role that grants permission to list Amazon S3 buckets for the account.
- Add a policy to let the user assume the role.
- Assume the role and list Amazon S3 buckets using temporary credentials.
- Delete the policy, role, and user.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create functions that wrap IAM user actions.

```
suspend fun main(args: Array<String>) {  
  
    val usage = """  
Usage:  
    <username> <policyName> <roleName> <roleSessionName> <fileLocation>  
<bucketName>  
  
Where:  
    username - The name of the IAM user to create.  
    policyName - The name of the policy to create.  
    roleName - The name of the role to create.  
    roleSessionName - The name of the session required for the assumeRole  
operation.  
    fileLocation - The file location to the JSON required to create the role (see  
Readme).  
    bucketName - The name of the Amazon S3 bucket from which objects are read.  
    """  
  
    if (args.size != 6) {  
        println(usage)  
        exitProcess(1)  
    }  
  
    val userName = args[0]  
    val policyName = args[1]  
    val roleName = args[2]

## AWS KMS examples using SDK for Kotlin

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Kotlin with AWS Key Management Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3581\)](#)

## Actions

### Create a grant for a key

The following code example shows how to create a grant for a KMS key.

#### SDK for Kotlin

##### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun createNewGrant(keyIdVal: String?, granteePrincipalVal: String?, operation: String): String? {  
  
    val operation0b = GrantOperation.fromValue(operation)  
    val grantOperationList = ArrayList<GrantOperation>()  
    grantOperationList.add(operation0b)  
  
    val request = CreateGrantRequest {  
        keyId = keyIdVal  
        granteePrincipal = granteePrincipalVal  
        operations = grantOperationList  
    }  
  
    return client.createGrant(request).grantId  
}
```

```
        }

        KmsClient { region = "us-west-2" }.use { kmsClient ->
            val response = kmsClient.createGrant(request)
            return response.grantId
        }
    }
```

- For API details, see [CreateGrant](#) in *AWS SDK for Kotlin API reference*.

## Create a key

The following code example shows how to create an AWS KMS key.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun createKey(keyDesc: String?): String? {

    val request = CreateKeyRequest {
        description = keyDesc
        customerMasterKeySpec = CustomerMasterKeySpec.SymmetricDefault
        keyUsage = KeyUsageType.fromValue("ENCRYPT_DECRYPT")
    }

    KmsClient { region = "us-west-2" }.use { kmsClient ->
        val result = kmsClient.createKey(request)
        println("Created a customer key with id " + result.keyMetadata?.arn)
        return result.keyMetadata?.keyId
    }
}
```

- For API details, see [CreateKey](#) in *AWS SDK for Kotlin API reference*.

## Create an alias for a key

The following code example shows how to create an alias for a KMS key.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun createCustomAlias(targetKeyIdVal: String?, aliasNameVal: String?) {

    val request = CreateAliasRequest {
        aliasName = aliasNameVal
        targetKeyId = targetKeyIdVal
    }
}
```

```
KmsClient { region = "us-west-2" }.use { kmsClient ->
    kmsClient.createAlias(request)
    println("$aliasNameVal was successfully created")
}
}
```

- For API details, see [CreateAlias](#) in *AWS SDK for Kotlin API reference*.

## Decrypt ciphertext

The following code example shows how to decrypt ciphertext that was encrypted by a KMS key.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun encryptData(keyIdValue: String): ByteArray? {
    val text = "This is the text to encrypt by using the AWS KMS Service"
    val myBytes: ByteArray = text.toByteArray()

    val encryptRequest = EncryptRequest {
        keyId = keyIdValue
        plaintext = myBytes
    }

    KmsClient { region = "us-west-2" }.use { kmsClient ->
        val response = kmsClient.encrypt(encryptRequest)
        val algorithm: String = response.encryptionAlgorithm.toString()
        println("The encryption algorithm is $algorithm")

        // Return the encrypted data.
        return response.ciphertextBlob
    }
}

suspend fun decryptData(encryptedDataVal: ByteArray?, keyIdVal: String?, path: String)?
{
    val decryptRequest = DecryptRequest {
        ciphertextBlob = encryptedDataVal
        keyId = keyIdVal
    }
    KmsClient { region = "us-west-2" }.use { kmsClient ->
        val decryptResponse = kmsClient.decrypt(decryptRequest)
        val myVal = decryptResponse.plaintext

        // Write the decrypted data to a file.
        if (myVal != null) {
            File(path).writeBytes(myVal)
        }
    }
}
```

- For API details, see [Decrypt](#) in *AWS SDK for Kotlin API reference*.

## Describe a key

The following code example shows how to describe a KMS key.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun describeSpecifcKey(keyIdVal: String?) {  
  
    val request = DescribeKeyRequest {  
        keyId = keyIdVal  
    }  
  
    KmsClient { region = "us-west-2" }.use { kmsClient ->  
        val response = kmsClient.describeKey(request)  
        println("The key description is ${response.keyMetadata?.description}")  
        println("The key ARN is ${response.keyMetadata?.arn}")  
    }  
}
```

- For API details, see [DescribeKey](#) in *AWS SDK for Kotlin API reference*.

## Disable a key

The following code example shows how to disable a KMS key.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun disableKey(keyIdVal: String?) {  
  
    val request = DisableKeyRequest {  
        keyId = keyIdVal  
    }  
  
    KmsClient { region = "us-west-2" }.use { kmsClient ->  
        kmsClient.disableKey(request)  
        println("$keyIdVal was successfully disabled")  
    }  
}
```

- For API details, see [DisableKey](#) in *AWS SDK for Kotlin API reference*.

## Enable a key

The following code example shows how to enable a KMS key.

## SDK for Kotlin

### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun enableKey(keyIdVal: String?) {  
  
    val request = EnableKeyRequest {  
        keyId = keyIdVal  
    }  
  
    KmsClient { region = "us-west-2" }.use { kmsClient ->  
        kmsClient.enableKey(request)  
        println("$keyIdVal was successfully enabled.")  
    }  
}
```

- For API details, see [EnableKey](#) in *AWS SDK for Kotlin API reference*.

## Encrypt text using a key

The following code example shows how to encrypt text using a KMS key.

## SDK for Kotlin

### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun encryptData(keyIdValue: String): ByteArray? {  
  
    val text = "This is the text to encrypt by using the AWS KMS Service"  
    val myBytes: ByteArray = text.toByteArray()  
  
    val encryptRequest = EncryptRequest {  
        keyId = keyIdValue  
        plaintext = myBytes  
    }  
  
    KmsClient { region = "us-west-2" }.use { kmsClient ->  
        val response = kmsClient.encrypt(encryptRequest)  
        val algorithm: String = response.encryptionAlgorithm.toString()  
        println("The encryption algorithm is $algorithm")  
  
        // Return the encrypted data.  
        return response.ciphertextBlob  
    }  
}  
  
suspend fun decryptData(encryptedDataVal: ByteArray?, keyIdVal: String?, path: String)  
{  
  
    val decryptRequest = DecryptRequest {  
        ciphertextBlob = encryptedDataVal  
    }
```

```
        keyId = keyIdVal
    }
    KmsClient { region = "us-west-2" }.use { kmsClient ->
        val decryptResponse = kmsClient.decrypt(decryptRequest)
        val myVal = decryptResponse.plaintext

        // Write the decrypted data to a file.
        if (myVal != null) {
            File(path).writeBytes(myVal)
        }
    }
}
```

- For API details, see [Encrypt in AWS SDK for Kotlin API reference](#).

## List aliases for a key

The following code example shows how to list aliases for a KMS key.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun listAllAliases() {

    val request = ListAliasesRequest {
        limit = 15
    }

    KmsClient { region = "us-west-2" }.use { kmsClient ->
        val response = kmsClient.listAliases(request)
        response.aliases?.forEach { alias ->
            println("The alias name is ${alias.aliasName}")
        }
    }
}
```

- For API details, see [ListAliases in AWS SDK for Kotlin API reference](#).

## List grants for a key

The following code example shows how to list grants for a KMS key.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun displayGrantIds(keyIdVal: String?) {
```

```
    val request = ListGrantsRequest {
        keyId = keyIdVal
        limit = 15
    }

    KmsClient { region = "us-west-2" }.use { kmsClient ->
        val response = kmsClient.listGrants(request)
        response.grants?.forEach { grant ->
            println("The grant Id is ${grant.grantId}")
        }
    }
}
```

- For API details, see [ListGrants](#) in *AWS SDK for Kotlin API reference*.

## List keys

The following code example shows how to list KMS keys.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun listAllKeys() {

    val request = ListKeysRequest {
        limit = 15
    }

    KmsClient { region = "us-west-2" }.use { kmsClient ->
        val response = kmsClient.listKeys(request)
        response.keys?.forEach { key ->
            println("The key ARN is ${key.keyArn}")
            println("The key Id is ${key.keyId}")
        }
    }
}
```

## Lambda examples using SDK for Kotlin

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Kotlin with AWS Lambda.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3588\)](#)
- [Scenarios \(p. 3589\)](#)

## Actions

### Create a function

The following code example shows how to create a Lambda function.

#### SDK for Kotlin

##### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun createNewFunction(  
    myFunctionName: String,  
    s3BucketName: String,  
    myS3Key: String,  
    myHandler: String,  
    myRole: String  
) : String? {  
  
    val functionCode = FunctionCode {  
        s3Bucket = s3BucketName  
        s3Key = myS3Key  
    }  
  
    val request = CreateFunctionRequest {  
        functionName = myFunctionName  
        code = functionCode  
        description = "Created by the Lambda Kotlin API"  
        handler = myHandler  
        role = myRole  
        runtime = Runtime.Java8  
    }  
  
    LambdaClient { region = "us-west-2" }.use { awsLambda ->  
        val functionResponse = awsLambda.createFunction(request)  
        awsLambda.waitUntilFunctionActive {  
            functionName = myFunctionName  
        }  
        return functionResponse.functionArn  
    }  
}
```

- For API details, see [CreateFunction](#) in *AWS SDK for Kotlin API reference*.

### Delete a function

The following code example shows how to delete a Lambda function.

#### SDK for Kotlin

##### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun deleteLambdaFunction(myFunctionName: String) {  
  
    val request = DeleteFunctionRequest {  
        functionName = myFunctionName  
    }  
  
    LambdaClient { region = "us-west-2" }.use { awsLambda ->  
        awsLambda.deleteFunction(request)  
        println("$myFunctionName was deleted")  
    }  
}
```

- For API details, see [DeleteFunction](#) in *AWS SDK for Kotlin API reference*.

## Invoke a function

The following code example shows how to invoke a Lambda function.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun invokeFunction(functionNameVal: String) {  
  
    val json = """{"inputValue":"1000"}"""  
    val byteArray = json.trimIndent().encodeToByteArray()  
    val request = InvokeRequest {  
        functionName = functionNameVal  
        logType = LogType.Tail  
        payload = byteArray  
    }  
  
    LambdaClient { region = "us-west-2" }.use { awsLambda ->  
        val res = awsLambda.invoke(request)  
        println("${res.payload?.toString(Charsets.UTF_8)}")  
        println("The log result is ${res.logResult}")  
    }  
}
```

- For API details, see [Invoke](#) in *AWS SDK for Kotlin API reference*.

## Scenarios

### Get started with functions

The following code example shows how to:

- Create an AWS Identity and Access Management (IAM) role that grants Lambda permission to write to logs.
- Create a Lambda function and upload handler code.
- Invoke the function with a single parameter and get results.

- Update the function code and configure its Lambda environment with an environment variable.
- Invoke the function with new parameters and get results. Display the execution log that's returned from the invocation.
- List the functions for your account.
- Delete the IAM role and the Lambda function.

For more information, see [Create a Lambda function with the console](#).

## SDK for Kotlin

### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun main(args: Array<String>) {  
  
    val usage = """  
        Usage:  
            <functionName> <role> <handler> <bucketName> <updatedBucketName> <key>  
  
        Where:  
            functionName - The name of the AWS Lambda function.  
            role - The AWS Identity and Access Management (IAM) service role that has  
AWS Lambda permissions.  
            handler - The fully qualified method name (for example,  
example.Handler::handleRequest).  
            bucketName - The Amazon Simple Storage Service (Amazon S3) bucket name that  
contains the ZIP or JAR used for the Lambda function's code.  
            updatedBucketName - The Amazon S3 bucket name that contains the .zip  
or .jar used to update the Lambda function's code.  
            key - The Amazon S3 key name that represents the .zip or .jar file (for  
example, LambdaHello-1.0-SNAPSHOT.jar).  
        """

## Amazon Pinpoint examples using SDK for Kotlin

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Kotlin with Amazon Pinpoint.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3593\)](#)

## Actions

### Create a campaign

The following code example shows how to create a campaign.

#### SDK for Kotlin

##### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun createPinCampaign(appId: String, segmentIdVal: String) {

    val schedule0b = Schedule {
        startTime = "IMMEDIATE"
    }

    val defaultMessage0b = Message {
        action = Action.OpenApp
        body = "My message body"
        title = "My message title"
    }
}
```

```
    val messageConfiguration0b = MessageConfiguration {
        defaultMessage = defaultMessage0b
    }

    val writeCampaign = WriteCampaignRequest {
        description = "My description"
        schedule = schedule0b
        name = "MyCampaign"
        segmentId = segmentIdVal
        messageConfiguration = messageConfiguration0b
    }

    PinpointClient { region = "us-west-2" }.use { pinpoint ->
        val result: CreateCampaignResponse = pinpoint.createCampaign(
            CreateCampaignRequest {
                applicationId = appId
                writeCampaignRequest = writeCampaign
            }
        )
        println("Campaign ID is ${result.campaignResponse?.id}")
    }
}
```

## Create a segment

The following code example shows how to create a segment.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun createPinpointSegment(applicationIdVal: String?): String? {

    val segmentAttributes = mutableMapOf<String, AttributeDimension>()
    val myList = mutableListOf<String>()
    myList.add("Lakers")

    val atts = AttributeDimension {
        attributeType = AttributeType.Inclusive
        values = myList
    }

    segmentAttributes["Team"] = atts
    val recencyDimension = RecencyDimension {
        duration = Duration.fromValue("DAY_30")
        recencyType = RecencyType.fromValue("ACTIVE")
    }

    val segmentBehaviors = SegmentBehaviors {
        recency = recencyDimension
    }

    val segmentLocation = SegmentLocation {}
    val dimensions0b = SegmentDimensions {
```

```
        attributes = segmentAttributes
        behavior = segmentBehaviors
        demographic = SegmentDemographics {}
        location = segmentLocation
    }

    val writeSegmentRequest0b = WriteSegmentRequest {
        name = "MySegment101"
        dimensions = dimensions0b
    }

    PinpointClient { region = "us-west-2" }.use { pinpoint ->
        val createSegmentResult: CreateSegmentResponse = pinpoint.createSegment(
            CreateSegmentRequest {
                applicationId = applicationIdVal
                writeSegmentRequest = writeSegmentRequest0b
            }
        )
        println("Segment ID is ${createSegmentResult.segmentResponse?.id}")
        return createSegmentResult.segmentResponse?.id
    }
}
```

- For API details, see [CreateSegment in AWS SDK for Kotlin API reference](#).

## Create an application

The following code example shows how to create an application.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun createApplication(applicationName: String?): String? {

    val createApplicationRequest0b = CreateApplicationRequest {
        name = applicationName
    }

    PinpointClient { region = "us-west-2" }.use { pinpoint ->
        val result = pinpoint.createApp(
            CreateAppRequest {
                createApplicationRequest = createApplicationRequest0b
            }
        )
        return result.applicationResponse?.id
    }
}
```

- For API details, see [CreateApp in AWS SDK for Kotlin API reference](#).

## Delete an application

The following code example shows how to delete an application.

## SDK for Kotlin

### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun deletePinApp(appId: String?) {  
  
    PinpointClient { region = "us-west-2" }.use { pinpoint ->  
        val result = pinpoint.deleteApp(  
            DeleteAppRequest {  
                applicationId = appId  
            }  
        )  
        val appName = result.applicationResponse?.name  
        println("Application $appName has been deleted.")  
    }  
}
```

- For API details, see [DeleteApp](#) in *AWS SDK for Kotlin API reference*.

## Delete an endpoint

The following code example shows how to delete an endpoint.

## SDK for Kotlin

### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun deletePinEndpoint(appIdVal: String?, endpointIdVal: String?) {  
  
    val deleteEndpointRequest = DeleteEndpointRequest {  
        applicationId = appIdVal  
        endpointId = endpointIdVal  
    }  
  
    PinpointClient { region = "us-west-2" }.use { pinpoint ->  
        val result = pinpoint.deleteEndpoint(deleteEndpointRequest)  
        val id = result.endpointResponse?.id  
        println("The deleted endpoint is $id")  
    }  
}
```

- For API details, see [DeleteEndpoint](#) in *AWS SDK for Kotlin API reference*.

## Get endpoints

The following code example shows how to get endpoints.

## SDK for Kotlin

### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun lookupPinpointEndpoint(appId: String?, endpoint: String?) {  
  
    PinpointClient { region = "us-west-2" }.use { pinpoint ->  
        val result = pinpoint.getEndpoint(  
            GetEndpointRequest {  
                applicationId = appId  
                endpointId = endpoint  
            }  
        )  
        val endResponse = result.endpointResponse  
  
        // Uses the Google Gson library to pretty print the endpoint JSON.  
        val gson: com.google.gson.Gson = GsonBuilder()  
            .setFieldNamingPolicy(FieldNamingPolicy.UPPER_CAMEL_CASE)  
            .setPrettyPrinting()  
            .create()  
  
        val endpointJson: String = gson.toJson(endResponse)  
        println(endpointJson)  
    }  
}
```

- For API details, see [GetEndpoint](#) in *AWS SDK for Kotlin API reference*.

## List segments

The following code example shows how to list segments.

## SDK for Kotlin

### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun listSegs(appId: String?) {  
  
    PinpointClient { region = "us-west-2" }.use { pinpoint ->  
  
        val response = pinpoint.getSegments(  
            GetSegmentsRequest {  
                applicationId = appId  
            }  
        )  
        response.segmentsResponse?.item?.forEach { segment ->  
            println("Segment id is ${segment.id}")  
        }  
    }  
}
```

- For API details, see [GetSegments](#) in *AWS SDK for Kotlin API reference*.

## Send email and text messages

The following code example shows how to send email and text messages with Amazon Pinpoint.

### SDK for Kotlin

#### Note

        pinpoint.sendMessages(
            SendMessagesRequest {
                applicationId = appId
                messageRequest = messageRequest0b
            }
        )
        println("The email message was successfully sent")
    }
}
```

- For API details, see [SendMessages](#) in *AWS SDK for Kotlin API reference*.

## Amazon RDS examples using SDK for Kotlin

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Kotlin with Amazon Relational Database Service.

**Actions** are code excerpts that show you how to call individual service functions.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3599\)](#)
- [Scenarios \(p. 3602\)](#)

## Actions

### Create a DB instance

The following code example shows how to create an Amazon RDS DB instance and wait for it to become available.

#### SDK for Kotlin

##### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun createDatabaseInstance(
    dbInstanceIdentifierVal: String?,
    dbNamedbVal: String?,
    masterUsernameVal: String?,
    masterUserPasswordVal: String?
) {

    val instanceRequest = CreateDbInstanceRequest {
```

```
        dbInstanceIdentifier = dbInstanceIdentifierVal
        allocatedStorage = 100
        dbName = dbNameVal
        engine = "mysql"
        dbInstanceClass = "db.m4.large"
        engineVersion = "8.0.15"
        storageType = "standard"
        masterUsername = masterUsernameVal
        masterUserPassword = masterUserPasswordVal
    }

    RdsClient { region = "us-west-2" }.use { rdsClient ->
        val response = rdsClient.createDbInstance(instanceRequest)
        print("The status is ${response.dbInstance?.dbInstanceState}")
    }
}

// Waits until the database instance is available.
suspend fun waitForInstanceReady(dbInstanceIdentifierVal: String?) {
    val sleepTime: Long = 20
    var instanceReady = false
    var instanceReadyStr = ""
    println("Waiting for instance to become available.")

    val instanceRequest = DescribeDbInstancesRequest {
        dbInstanceIdentifier = dbInstanceIdentifierVal
    }

    RdsClient { region = "us-west-2" }.use { rdsClient ->
        while (!instanceReady) {
            val response = rdsClient.describeDbInstances(instanceRequest)
            val instanceList = response.dbInstances
            if (instanceList != null) {

                for (instance in instanceList) {
                    instanceReadyStr = instance.dbInstanceState.toString()
                    if (instanceReadyStr.contains("available"))
                        instanceReady = true
                    else {
                        println("...$instanceReadyStr")
                        delay(sleepTime * 1000)
                    }
                }
            }
        }
        println("Database instance is available!")
    }
}
```

- For API details, see [CreateDBInstance](#) in *AWS SDK for Kotlin API reference*.

## Delete a DB instance

The following code example shows how to delete an Amazon RDS DB instance.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun deleteDatabaseInstance(dbInstanceIdentifierVal: String?) {  
  
    val deleteDbInstanceRequest = DeleteDbInstanceRequest {  
        dbInstanceIdentifier = dbInstanceIdentifierVal  
        deleteAutomatedBackups = true  
        skipFinalSnapshot = true  
    }  
  
    RdsClient { region = "us-west-2" }.use { rdsClient ->  
        val response = rdsClient.deleteDbInstance(deleteDbInstanceRequest)  
        print("The status of the database is ${response.dbInstance?.dbInstanceState}")  
    }  
}
```

- For API details, see [DeleteDBInstance](#) in *AWS SDK for Kotlin API reference*.

## Describe DB instances

The following code example shows how to describe Amazon RDS DB instances.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun describeInstances() {  
  
    RdsClient { region = "us-west-2" }.use { rdsClient ->  
        val response = rdsClient.describeDbInstances(DescribeDbInstancesRequest {})  
        response.dbInstances?.forEach { instance ->  
            println("Instance Identifier is ${instance.dbInstanceIdentifier}")  
            println("The Engine is ${instance.engine}")  
            println("Connection endpoint is ${instance.endpoint?.address}")  
        }  
    }  
}
```

- For API details, see [DescribeDBInstances](#) in *AWS SDK for Kotlin API reference*.

## Modify a DB instance

The following code example shows how to modify an Amazon RDS DB instance.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun updateInstance(dbInstanceIdentifierVal: String?, masterUserPasswordVal: String?) {  
  
    val request = ModifyDbInstanceRequest {  
        dbInstanceIdentifier = dbInstanceIdentifierVal  
        publiclyAccessible = true  
        masterUserPassword = masterUserPasswordVal  
    }  
  
    RdsClient { region = "us-west-2" }.use { rdsClient ->  
        val instanceResponse = rdsClient.modifyDbInstance(request)  
        println("The ARN of the modified database is  
        ${instanceResponse.dbInstance?.dbInstanceArn}")  
    }  
}
```

- For API details, see [ModifyDBInstance](#) in *AWS SDK for Kotlin API reference*.

## Retrieve attributes

The following code example shows how to retrieve attributes that belong to an Amazon RDS account.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun getAccountAttributes() {  
  
    RdsClient { region = "us-west-2" }.use { rdsClient ->  
        val response =  
        rdsClient.describeAccountAttributes(DescribeAccountAttributesRequest {})  
        response.accountQuotas?.forEach { quotas ->  
            val response = response.accountQuotas  
            println("Name is: ${quotas.accountQuotaName}")  
            println("Max value is ${quotas.max}")  
        }  
    }  
}
```

- For API details, see [DescribeAccountAttributes](#) in *AWS SDK for Kotlin API reference*.

## Scenarios

### Get started with DB instances

The following code example shows how to:

- Create a custom DB parameter group and set parameter values.
- Create a DB instance that's configured to use the parameter group. The DB instance also contains a database.
- Take a snapshot of the instance.

- Delete the instance and parameter group.

## SDK for Kotlin

### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/**  
Before running this Java V2 code example, set up your development environment,  
including your credentials.  
  
For more information, see the following documentation topic:  
https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html  
  
This example performs the following tasks:  
  
1. Returns a list of the available DB engines by invoking the DescribeDbEngineVersions  
method.  
2. Selects an engine family and create a custom DB parameter group by invoking the  
createDBParameterGroup method.  
3. Gets the parameter groups by invoking the DescribeDbParameterGroups method.  
4. Gets parameters in the group by invoking the DescribeDbParameters method.  
5. Modifies both the auto_increment_offset and auto_increment_increments parameters by  
invoking the modifyDBParameterGroup method.  
6. Gets and displays the updated parameters.  
7. Gets a list of allowed engine versions by invoking the describeDbEngineVersions  
method.  
8. Gets a list of micro instance classes available for the selected engine.  
9. Creates an RDS database instance that contains a MySQL database and uses the  
parameter group  
10. Waits for DB instance to be ready and print out the connection endpoint value.  
11. Creates a snapshot of the DB instance.  
12. Waits for DB snapshot to be ready.  
13. Deletes the DB instance. rds.DeleteDbInstance.  
14. Deletes the parameter group.  
*/

## Amazon Redshift examples using SDK for Kotlin

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Kotlin with Amazon Redshift.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3610\)](#)

## Actions

### Create a cluster

The following code example shows how to create an Amazon Redshift cluster.

#### SDK for Kotlin

##### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the cluster.

```
suspend fun createCluster(clusterId: String?, masterUsernameVal: String?,  
    masterUserPasswordVal: String?) {  
    val clusterRequest = CreateClusterRequest {  
        clusterIdentifier = clusterId  
        masterUsername = masterUsernameVal // set the user name here  
        masterUserPassword = masterUserPasswordVal // set the user password here  
        nodeType = "ds2.xlarge"  
        publiclyAccessible = true  
        numberofNodes = 2  
    }  
  
    RedshiftClient { region = "us-west-2" }.use { redshiftClient ->  
        val clusterResponse = redshiftClient.createCluster(clusterRequest)  
        println("Created cluster ${clusterResponse.cluster?.clusterIdentifier}")  
    }  
}
```

- For API details, see [CreateCluster](#) in *AWS SDK for Kotlin API reference*.

### Delete a cluster

The following code example shows how to delete an Amazon Redshift cluster.

#### SDK for Kotlin

##### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Delete the cluster.

```
suspend fun deleteRedshiftCluster(clusterId: String?) {
```

```
    val request = DeleteClusterRequest {
        clusterIdentifier = clusterId
        skipFinalClusterSnapshot = true
    }

    RedshiftClient { region = "us-west-2" }.use { redshiftClient ->
        val response = redshiftClient.deleteCluster(request)
        println("The status is ${response.cluster?.clusterStatus}")
    }
}
```

- For API details, see [DeleteCluster](#) in *AWS SDK for Kotlin API reference*.

## Describe your clusters

The following code example shows how to describe your Amazon Redshift clusters.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Describe the cluster.

```
suspend fun describeRedshiftClusters() {

    RedshiftClient { region = "us-west-2" }.use { redshiftClient ->
        val clusterResponse = redshiftClient.describeClusters(DescribeClustersRequest {})
        val clusterList = clusterResponse.clusters

        if (clusterList != null) {
            for (cluster in clusterList) {
                println("Cluster database name is ${cluster.dbName}")
                println("Cluster status is ${cluster.clusterStatus}")
            }
        }
    }
}
```

- For API details, see [DescribeClusters](#) in *AWS SDK for Kotlin API reference*.

## Modify a cluster

The following code example shows how to modify an Amazon Redshift cluster.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Modify a cluster.

```
suspend fun modifyCluster(clusterId: String?) {
    val modifyClusterRequest = ModifyClusterRequest {
        clusterIdentifier = clusterId
        preferredMaintenanceWindow = "wed:07:30-wed:08:00"
    }

    RedshiftClient { region = "us-west-2" }.use { redshiftClient ->
        val clusterResponse = redshiftClient.modifyCluster(modifyClusterRequest)
        println("The modified cluster was successfully modified and has
        ${clusterResponse.cluster?.preferredMaintenanceWindow} as the maintenance window")
    }
}
```

- For API details, see [ModifyCluster](#) in *AWS SDK for Kotlin API reference*.

## Amazon Rekognition examples using SDK for Kotlin

    }
}
```

```
        RekognitionClient { region = "us-east-1" }.use { rekClient ->
            rekClient.deleteFaces(deleteFacesRequest)
            println("$faceIdVal was deleted from the collection")
        }
    }
```

- For API details, see [DeleteFaces](#) in *AWS SDK for Kotlin API reference*.

## Describe a collection

The following code example shows how to describe an Amazon Rekognition collection.

For more information, see [Describing a collection](#).

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun describeColl(collectionName: String) {

    val request = DescribeCollectionRequest {
        collectionId = collectionName
    }

    RekognitionClient { region = "us-east-1" }.use { rekClient ->
        val response = rekClient.describeCollection(request)
        println("The collection Arn is ${response.collectionArn}")
        println("The collection contains this many faces ${response.faceCount}")
    }
}
```

- For API details, see [DescribeCollection](#) in *AWS SDK for Kotlin API reference*.

## Detect faces in an image

The following code example shows how to detect faces in an image with Amazon Rekognition.

For more information, see [Detecting faces in an image](#).

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun detectFacesinImage(sourceImage: String?) {

    val souImage = Image {
        bytes = (File(sourceImage)).readBytes()
```

```
    }

    val request = DetectFacesRequest {
        attributes = listOf(Attribute.All)
        image = souImage
    }

    RekognitionClient { region = "us-east-1" }.use { rekClient ->
        val response = rekClient.detectFaces(request)
        response.faceDetails?.forEach { face ->
            val ageRange = face.ageRange
            println("The detected face is estimated to be between ${ageRange?.low} and
${ageRange?.high} years old.")
            println("There is a smile ${face.smile?.value}")
        }
    }
}
```

- For API details, see [DetectFaces](#) in *AWS SDK for Kotlin API reference*.

## Detect labels in an image

The following code example shows how to detect labels in an image with Amazon Rekognition.

For more information, see [Detecting labels in an image](#).

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun detectImageLabels(sourceImage: String) {

    val souImage = Image {
        bytes = (File(sourceImage)).readBytes()
    }
    val request = DetectLabelsRequest {
        image = souImage
        maxLabels = 10
    }

    RekognitionClient { region = "us-east-1" }.use { rekClient ->
        val response = rekClient.detectLabels(request)
        response.labels?.forEach { label ->
            println("${label.name} : ${label.confidence}")
        }
    }
}
```

- For API details, see [DetectLabels](#) in *AWS SDK for Kotlin API reference*.

## Detect moderation labels in an image

The following code example shows how to detect moderation labels in an image with Amazon Rekognition. Moderation labels identify content that may be inappropriate for some audiences.

For more information, see [Detecting inappropriate images](#).

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun detectModLabels(sourceImage: String) {

    val myImage = Image {
        this.bytes = (File(sourceImage).readBytes())
    }

    val request = DetectModerationLabelsRequest {
        image = myImage
        minConfidence = 60f
    }

    RekognitionClient { region = "us-east-1" }.use { rekClient ->
        val response = rekClient.detectModerationLabels(request)
        response.moderationLabels?.forEach { label ->
            println("Label: ${label.name} - Confidence: ${label.confidence} % Parent: ${label.parentName}")
        }
    }
}
```

- For API details, see [DetectModerationLabels](#) in *AWS SDK for Kotlin API reference*.

### Detect text in an image

The following code example shows how to detect text in an image with Amazon Rekognition.

For more information, see [Detecting text in an image](#).

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun detectTextLabels(sourceImage: String?) {

    val souImage = Image {
        bytes = (File(sourceImage).readBytes())
    }

    val request = DetectTextRequest {
        image = souImage
    }

    RekognitionClient { region = "us-east-1" }.use { rekClient ->
        val response = rekClient.detectText(request)
    }
}
```

```
        response.textDetections?.forEach { text ->
            println("Detected: ${text.detectedText}")
            println("Confidence: ${text.confidence}")
            println("Id: ${text.id}")
            println("Parent Id: ${text.parentId}")
            println("Type: ${text.type}")
        }
    }
}
```

- For API details, see [DetectText](#) in *AWS SDK for Kotlin API reference*.

## Index faces to a collection

The following code example shows how to index faces in an image and add them to an Amazon Rekognition collection.

For more information, see [Adding faces to a collection](#).

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun addToCollection(collectionIdVal: String?, sourceImage: String) {

    val souImage = Image {
        bytes = (File(sourceImage).readBytes())
    }

    val request = IndexFacesRequest {
        collectionId = collectionIdVal
        image = souImage
        maxFaces = 1
        qualityFilter = QualityFilter.Auto
        detectionAttributes = listOf(Attribute.Default)
    }

    RekognitionClient { region = "us-east-1" }.use { rekClient ->
        val facesResponse = rekClient.indexFaces(request)

        // Display the results.
        println("Results for the image")
        println("\n Faces indexed:")
        facesResponse.faceRecords?.forEach { faceRecord ->
            println("Face ID: ${faceRecord.face?.faceId}")
            println("Location: ${faceRecord.faceDetail?.boundingBox}")
        }

        println("Faces not indexed:")
        facesResponse.unindexedFaces?.forEach { unindexedFace ->
            println("Location: ${unindexedFace.faceDetail?.boundingBox}")
            println("Reasons:")

            unindexedFace.reasons?.forEach { reason ->
                println("Reason: $reason")
            }
        }
    }
}
```

```
        }  
    }  
}
```

- For API details, see [IndexFaces](#) in *AWS SDK for Kotlin API reference*.

## List collections

The following code example shows how to list Amazon Rekognition collections.

For more information, see [Listing collections](#).

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun listAllCollections() {  
  
    val request = ListCollectionsRequest {  
        maxResults = 10  
    }  
  
    RekognitionClient { region = "us-east-1" }.use { rekClient ->  
        val response = rekClient.listCollections(request)  
        response.collectionIds?.forEach { resultId ->  
            println(resultId)  
        }  
    }  
}
```

- For API details, see [ListCollections](#) in *AWS SDK for Kotlin API reference*.

## List faces in a collection

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun listFacesCollection(collectionIdVal: String?) {  
  
    val request = ListFacesRequest {  
        collectionId = collectionIdVal  
        maxResults = 10  
    }
```

```
    RekognitionClient { region = "us-east-1" }.use { rekClient ->
        val response = rekClient.listFaces(request)
        response.faces?.forEach { face ->
            println("Confidence level there is a face: ${face.confidence}")
            println("The face Id value is ${face.faceId}")
        }
    }
}
```

- For API details, see [ListFaces](#) in *AWS SDK for Kotlin API reference*.

## Recognize celebrities in an image

The following code example shows how to recognize celebrities in an image with Amazon Rekognition.

For more information, see [Recognizing celebrities in an image](#).

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun recognizeAllCelebrities(sourceImage: String?) {

    val souImage = Image {
        bytes = (File(sourceImage).readBytes())
    }

    val request = RecognizeCelebritiesRequest {
        image = souImage
    }

    RekognitionClient { region = "us-east-1" }.use { rekClient ->
        val response = rekClient.recognizeCelebrities(request)
        response.celebrityFaces?.forEach { celebrity ->
            println("Celebrity recognized: ${celebrity.name}")
            println("Celebrity ID:${celebrity.id}")
            println("Further information (if available):")
            celebrity.urls?.forEach { url ->
                println(url)
            }
        }
        println("${response.unrecognizedFaces?.size} face(s) were unrecognized.")
    }
}
```

- For API details, see [RecognizeCelebrities](#) in *AWS SDK for Kotlin API reference*.

## Scenarios

### Detect information in videos

The following code example shows how to:

- Start Amazon Rekognition jobs to detect elements like people, objects, and text in videos.
- Check job status until jobs finish.
- Output the list of elements detected by each job.

## SDK for Kotlin

### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Detect faces in a video stored in an Amazon S3 bucket.

```
suspend fun startFaceDetection(channelVal: NotificationChannel?, bucketVal: String, videoVal: String) {

    val s3Obj = S3Object {
        bucket = bucketVal
        name = videoVal
    }
    val vidOb = Video {
        s3Object = s3Obj
    }

    val request = StartFaceDetectionRequest {
        jobTag = "Faces"
        faceAttributes = FaceAttributes.All
        notificationChannel = channelVal
        video = vidOb
    }

    RekognitionClient { region = "us-east-1" }.use { rekClient ->
        val startLabelDetectionResult = rekClient.startFaceDetection(request)
        startJobId = startLabelDetectionResult.jobId.toString()
    }
}

suspend fun getFaceResults() {

    var finished = false
    var status: String
    var yy = 0
    RekognitionClient { region = "us-east-1" }.use { rekClient ->
        var response: GetFaceDetectionResponse? = null

        val recognitionRequest = GetFaceDetectionRequest {
            jobId = startJobId
            maxResults = 10
        }

        // Wait until the job succeeds.
        while (!finished) {
            response = rekClient.getFaceDetection(recognitionRequest)
            status = response.jobStatus.toString()
            if (status.compareTo("SUCCEEDED") == 0)
                finished = true
            else {
                println("$yy status is: $status")
                delay(1000)
            }
            yy++
        }
    }
}
```

```

    }

    // Proceed when the job is done - otherwise VideoMetadata is null.
    val videoMetaData = response?.videoMetadata
    println("Format: ${videoMetaData?.format}")
    println("Codec: ${videoMetaData?.codec}")
    println("Duration: ${videoMetaData?.durationMillis}")
    println("FrameRate: ${videoMetaData?.frameRate}")

    // Show face information.
    response?.faces?.forEach { face ->
        println("Age: ${face.face?.ageRange}")
        println("Face: ${face.face?.beard}")
        println("Eye glasses: ${face?.face?.eyeglasses}")
        println("Mustache: ${face.face?.mustache}")
        println("Smile: ${face.face?.smile}")
    }
}

}

```

Detect inappropriate or offensive content in a video stored in an Amazon S3 bucket.

```

suspend fun startModerationDetection(channel: NotificationChannel?, bucketVal: String?,
                                     videoVal: String?) {

## Amazon S3 examples using SDK for Kotlin

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Kotlin with Amazon Simple Storage Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3623\)](#)
- [Scenarios \(p. 3629\)](#)

## Actions

### Copy an object from one bucket to another

The following code example shows how to copy an S3 object from one bucket to another.

## SDK for Kotlin

### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun copyBucketObject(  
    fromBucket: String,  
    objectKey: String,  
    toBucket: String  
) {  
  
    var encodedUrl = ""  
    try {  
        encodedUrl = URLEncoder.encode("$fromBucket/$objectKey",  
StandardCharsets.UTF_8.toString())  
    } catch (e: UnsupportedEncodingException) {  
        println("URL could not be encoded: " + e.message)  
    }  
  
    val request = CopyObjectRequest {  
        copySource = encodedUrl  
        bucket = toBucket  
        key = objectKey  
    }  
    S3Client { region = "us-east-1" }.use { s3 ->  
        s3.copyObject(request)  
    }  
}
```

- For API details, see [CopyObject](#) in *AWS SDK for Kotlin API reference*.

## Create a bucket

The following code example shows how to create an S3 bucket.

## SDK for Kotlin

### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun createNewBucket(bucketName: String) {  
  
    val request = CreateBucketRequest {  
        bucket = bucketName  
    }  
  
    S3Client { region = "us-east-1" }.use { s3 ->  
        s3.createBucket(request)  
        println("$bucketName is ready")  
    }  
}
```

- For API details, see [CreateBucket](#) in *AWS SDK for Kotlin API reference*.

## Delete a policy from a bucket

The following code example shows how to delete a policy from an S3 bucket.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun deleteS3BucketPolicy(bucketName: String?) {  
  
    val request = DeleteBucketPolicyRequest {  
        bucket = bucketName  
    }  
  
    S3Client { region = "us-east-1" }.use { s3 ->  
        s3.deleteBucketPolicy(request)  
        println("Done!")  
    }  
}
```

- For API details, see [DeleteBucketPolicy](#) in *AWS SDK for Kotlin API reference*.

## Delete multiple objects

The following code example shows how to delete multiple objects from an S3 bucket.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun deleteBucketObjects(bucketName: String, objectName: String) {  
  
    val objectId = ObjectIdentifier {  
        key = objectName  
    }  
  
    val delOb = Delete {  
        objects = listOf(objectId)  
    }  
  
    val request = DeleteObjectsRequest {  
        bucket = bucketName  
        delete = delOb  
    }  
  
    S3Client { region = "us-east-1" }.use { s3 ->  
        s3.deleteObjects(request)  
    }  
}
```

```
        println("$objectName was deleted from $bucketName")
    }
}
```

- For API details, see [DeleteObjects](#) in *AWS SDK for Kotlin API reference*.

## Get an object from a bucket

The following code example shows how to read data from an object in an S3 bucket.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun getObjectBytes(bucketName: String, keyName: String, path: String) {

    val request = GetObjectRequest {
        key = keyName
        bucket = bucketName
    }

    S3Client { region = "us-east-1" }.use { s3 ->
        s3.getObject(request) { resp ->
            val myFile = File(path)
            resp.body?.writeToFile(myFile)
            println("Successfully read $keyName from $bucketName")
        }
    }
}
```

- For API details, see [GetObject](#) in *AWS SDK for Kotlin API reference*.

## Get the ACL of an object

The following code example shows how to get the access control list (ACL) of an S3 object.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun getBucketACL(objectKey: String, bucketName: String) {

    val request = GetObjectAclRequest {
        bucket = bucketName
        key = objectKey
    }

    S3Client { region = "us-east-1" }.use { s3 ->
```

```
        val response = s3.getObjectAcl(request)
        response.grants?.forEach { grant ->
            println("Grant permission is ${grant.permission}")
        }
    }
}
```

- For API details, see [GetObjectAcl](#) in *AWS SDK for Kotlin API reference*.

## Get the policy for a bucket

The following code example shows how to get the policy for an S3 bucket.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun getPolicy(bucketName: String): String? {
    println("Getting policy for bucket $bucketName")

    val request = GetBucketPolicyRequest {
        bucket = bucketName
    }

    S3Client { region = "us-east-1" }.use { s3 ->
        val policyRes = s3.getBucketPolicy(request)
        return policyRes.policy
    }
}
```

- For API details, see [GetBucketPolicy](#) in *AWS SDK for Kotlin API reference*.

## List objects in a bucket

The following code example shows how to list objects in an S3 bucket.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun listBucketObjects(bucketName: String) {
    val request = ListObjectsRequest {

    }

    S3Client { region = "us-east-1" }.use { s3 ->
```

```
        val response = s3.listObjects(request)
        response.contents?.forEach { myObject ->
            println("The name of the key is ${myObject.key}")
            println("The object is ${calKb(myObject.size)} KBs")
            println("The owner is ${myObject.owner}")
        }
    }

private fun calKb(intValue: Long): Long {
    return intValue / 1024
}
```

- For API details, see [ListObjects](#) in *AWS SDK for Kotlin API reference*.

## Set a new ACL for a bucket

The following code example shows how to set a new access control list (ACL) for an S3 bucket.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun setBucketAcl(bucketName: String, idVal: String) {

    val myGrant = Grantee {
        id = idVal
        type = Type.CanonicalUser
    }

    val ownerGrant = Grant {
        grantee = myGrant
        permission = Permission.FullControl
    }

    val grantList = mutableListOf<Grant>()
    grantList.add(ownerGrant)

    val ownerOb = Owner {
        id = idVal
    }

    val acl = AccessControlPolicy {
        owner = ownerOb
        grants = grantList
    }

    val request = PutBucketAclRequest {
        bucket = bucketName
        accessControlPolicy = acl
    }

    S3Client { region = "us-east-1" }.use { s3 ->
        s3.putBucketAcl(request)
        println("An ACL was successfully set on $bucketName")
    }
}
```

```
}
```

- For API details, see [PutBucketAcl](#) in *AWS SDK for Kotlin API reference*.

## Upload an object to a bucket

The following code example shows how to upload an object to an S3 bucket.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun putS3Object(bucketName: String, objectKey: String, objectPath: String) {  
  
    val metadataVal = mutableMapOf<String, String>()  
    metadataVal["myVal"] = "test"  
  
    val request = PutObjectRequest {  
        bucket = bucketName  
        key = objectKey  
        metadata = metadataVal  
        body = File(objectPath).asByteStream()  
    }  
  
    S3Client { region = "us-east-1" }.use { s3 ->  
        val response = s3.putObject(request)  
        println("Tag information is ${response.eTag}")  
    }  
}
```

- For API details, see [PutObject](#) in *AWS SDK for Kotlin API reference*.

## Scenarios

### Get started with buckets and objects

The following code example shows how to:

- Create a bucket.
- Upload a file to the bucket.
- Download an object from a bucket.
- Copy an object to a subfolder in a bucket.
- List the objects in a bucket.
- Delete the objects in a bucket.
- Delete a bucket.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun main(args: Array<String>) {  
  
    val usage = """  
Usage:  
    <bucketName> <key> <objectPath> <savePath> <toBucket>  
  
Where:  
    bucketName - The Amazon S3 bucket to create.  
    key - The key to use.  
    objectPath - The path where the file is located (for example, C:/AWS/  
book2.pdf).  
    savePath - The path where the file is saved after it's downloaded (for example,  
C:/AWS/book2.pdf).  
    toBucket - An Amazon S3 bucket to where an object is copied to (for example,  
C:/AWS/book2.pdf).  
    """

## Amazon SNS examples using SDK for Kotlin

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Kotlin with Amazon Simple Notification Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3633\)](#)

## Actions

### Add tags to a topic

The following code example shows how to add tags to an Amazon SNS topic.

#### SDK for Kotlin

##### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun addTopicTags(topicArn: String) {  
  
    val tag = Tag {  
        key = "Team"  
        value = "Development"  
    }  
  
    val tag2 = Tag {  
        key = "Environment"  
        value = "Gamma"  
    }  
  
    val tagList = mutableListOf<Tag>()  
    tagList.add(tag)  
    tagList.add(tag2)  
  
    val request = TagResourceRequest {  
        resourceArn = topicArn  
        tags = tagList  
    }  
  
    SnsClient { region = "us-east-1" }.use { snsClient ->  
        snsClient.tagResource(request)  
        println("Tags have been added to $topicArn")  
    }  
}
```

- For API details, see [TagResource](#) in *AWS SDK for Kotlin API reference*.

### Create a topic

The following code example shows how to create an Amazon SNS topic.

#### SDK for Kotlin

##### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun createSNSTopic(topicName: String): String {  
  
    val request = CreateTopicRequest {  
        name = topicName  
    }  
  
    SnsClient { region = "us-east-1" }.use { snsClient ->  
        val result = snsClient.createTopic(request)  
        return result.topicArn.toString()  
    }  
}
```

- For API details, see [CreateTopic](#) in *AWS SDK for Kotlin API reference*.

## Delete a subscription

The following code example shows how to delete an Amazon SNS subscription.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun unSub(subscriptionArnVal: String) {  
  
    val request = UnsubscribeRequest {  
        subscriptionArn = subscriptionArnVal  
    }  
  
    SnsClient { region = "us-east-1" }.use { snsClient ->  
        snsClient.unsubscribe(request)  
        println("Subscription was removed for ${request.subscriptionArn}")  
    }  
}
```

- For API details, see [Unsubscribe](#) in *AWS SDK for Kotlin API reference*.

## Delete a topic

The following code example shows how to delete an Amazon SNS topic and all subscriptions to that topic.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun deleteSNSTopic(topicArnVal: String) {
```

```
    val request = DeleteTopicRequest {
        topicArn = topicArnVal
    }

    SnsClient { region = "us-east-1" }.use { snsClient ->
        snsClient.deleteTopic(request)
        println("$topicArnVal was successfully deleted.")
    }
}
```

- For API details, see [DeleteTopic](#) in *AWS SDK for Kotlin API reference*.

## Get the properties of a topic

The following code example shows how to get the properties of an Amazon SNS topic.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun getSNSTopicAttributes(topicArnVal: String) {

    val request = GetTopicAttributesRequest {
        topicArn = topicArnVal
    }

    SnsClient { region = "us-east-1" }.use { snsClient ->
        val result = snsClient.getTopicAttributes(request)
        println("${result.attributes}")
    }
}
```

- For API details, see [GetTopicAttributes](#) in *AWS SDK for Kotlin API reference*.

## List the subscribers of a topic

The following code example shows how to retrieve the list of subscribers of an Amazon SNS topic.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun listSNSSubscriptions() {

    SnsClient { region = "us-east-1" }.use { snsClient ->
        val response = snsClient.listSubscriptions(ListSubscriptionsRequest {})
    }
}
```

```
        response.subscriptions?.forEach { sub ->
            println("Sub ARN is ${sub.subscriptionArn}")
            println("Sub protocol is ${sub.protocol}")
        }
    }
}
```

- For API details, see [ListSubscriptions](#) in *AWS SDK for Kotlin API reference*.

## List topics

The following code example shows how to list Amazon SNS topics.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun listSNSTopics() {

    SnsClient { region = "us-east-1" }.use { snsClient ->
        val response = snsClient.listTopics(ListTopicsRequest { })
        response.topics?.forEach { topic ->
            println("The topic ARN is ${topic.topicArn}")
        }
    }
}
```

- For API details, see [ListTopics](#) in *AWS SDK for Kotlin API reference*.

## Publish an SMS text message

The following code example shows how to publish SMS messages using Amazon SNS.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun pubTextSMS(messageVal: String?, phoneNumberVal: String?) {

    val request = PublishRequest {
        message = messageVal
        phoneNumber = phoneNumberVal
    }

    SnsClient { region = "us-east-1" }.use { snsClient ->
        val result = snsClient.publish(request)
        println("${result.messageId} message sent.")
    }
}
```

```
    }
```

- For API details, see [Publish](#) in *AWS SDK for Kotlin API reference*.

## [Publish to a topic](#)

The following code example shows how to publish messages to an Amazon SNS topic.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun pubTopic(topicArnVal: String, messageVal: String) {  
  
    val request = PublishRequest {  
        message = messageVal  
        topicArn = topicArnVal  
    }  
  
    SnsClient { region = "us-east-1" }.use { snsClient ->  
        val result = snsClient.publish(request)  
        println("${result.messageId} message sent.")  
    }  
}
```

- For API details, see [Publish](#) in *AWS SDK for Kotlin API reference*.

## [Set topic attributes](#)

The following code example shows how to set Amazon SNS topic attributes.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun setTopAttr(attribute: String?, topicArnVal: String?, value: String?) {  
  
    val request = SetTopicAttributesRequest {  
        attributeName = attribute  
        attributeValue = value  
        topicArn = topicArnVal  
    }  
  
    SnsClient { region = "us-east-1" }.use { snsClient ->  
        snsClient.setTopicAttributes(request)  
        println("Topic ${request.topicArn} was updated.")  
    }  
}
```

```
    }
```

- For API details, see [SetTopicAttributes](#) in *AWS SDK for Kotlin API reference*.

## Subscribe a Lambda function to a topic

The following code example shows how to subscribe a Lambda function so it receives notifications from an Amazon SNS topic.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun subLambda(topicArnVal: String?, lambdaArn: String?) {  
  
    val request = SubscribeRequest {  
        protocol = "lambda"  
        endpoint = lambdaArn  
        returnSubscriptionArn = true  
        topicArn = topicArnVal  
    }  
  
    SnsClient { region = "us-east-1" }.use { snsClient ->  
        val result = snsClient.subscribe(request)  
        println(" The subscription Arn is ${result.subscriptionArn}")  
    }  
}
```

- For API details, see [Subscribe](#) in *AWS SDK for Kotlin API reference*.

## Subscribe an email address to a topic

The following code example shows how to subscribe an email address to an Amazon SNS topic.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun subEmail(topicArnVal: String, email: String): String {  
  
    val request = SubscribeRequest {  
        protocol = "email"  
        endpoint = email  
        returnSubscriptionArn = true  
        topicArn = topicArnVal  
    }
```

```
SnsClient { region = "us-east-1" }.use { snsClient ->
    val result = snsClient.subscribe(request)
    return result.subscriptionArn.toString()
}
}
```

- For API details, see [Subscribe](#) in *AWS SDK for Kotlin API reference*.

## Amazon SQS examples using SDK for Kotlin

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Kotlin with Amazon Simple Queue Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

## AWS Support examples using SDK for Kotlin

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Kotlin with AWS Support.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Get started

#### Hello AWS Support

The following code examples show how to get started using AWS Support.

.NET

#### AWS SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using Amazon AWSSupport;  
using Microsoft.Extensions.DependencyInjection;
```

```
using Microsoft.Extensions.Hosting;

public static class HelloSupport
{
    static async Task Main(string[] args)
    {
        // Use the AWS .NET Core Setup package to set up dependency injection for
        // the AWS Support service.
        // Use your AWS profile name, or leave it blank to use the default profile.
        // You must have one of the following AWS Support plans: Business,
        // Enterprise On-Ramp, or Enterprise. Otherwise, an exception will be thrown.
        using var host = Host.CreateDefaultBuilder(args)
            .ConfigureServices(_ =>
                services.AddAWSService<IAmazonAWSSupport>()
            ).Build();

        // Now the client is available for injection.
        var supportClient = host.Services.GetRequiredService<IAmazonAWSSupport>();

        // You can use await and any of the async methods to get a response.
        var response = await supportClient.DescribeServicesAsync();
        Console.WriteLine($"\\tHello AWS Support! There are
{response.Services.Count} services available.");
    }
}
```

- For API details, see [DescribeServices](#) in *AWS SDK for .NET API Reference*.

## Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/**
 * Before running this Java (v2) code example, set up your development environment,
 * including your credentials.
 *
 * For more information, see the following documentation topic:
 *
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html
 *
 * In addition, you must have the AWS Business Support Plan to use the AWS Support
 * Java API. For more information, see:
 *
 * https://aws.amazon.com/premiumsupport/plans/
 *
 * This Java example performs the following task:
 *
 * 1. Gets and displays available services.
 *
 *
 * NOTE: To see multiple operations, see SupportScenario.
 */

public class HelloSupport {

    public static void main(String[] args) {
        Region region = Region.US_WEST_2;
        SupportClient supportClient = SupportClient.builder()
```

```
.region(region)
.build();

System.out.println("***** Step 1. Get and display available services.");
displayServices(supportClient);
}

// Return a List that contains a Service name and Category name.
public static void displayServices(SupportClient supportClient) {
    try {
        DescribeServicesRequest servicesRequest =
DescribeServicesRequest.builder()
            .language("en")
            .build();

        DescribeServicesResponse response =
supportClient.describeServices(servicesRequest);
        List<Service> services = response.services();

        System.out.println("Get the first 10 services");
        int index = 1;
        for (Service service: services) {
            if (index== 11)
                break;

            System.out.println("The Service name is: "+service.name());

            // Display the Categories for this service.
            List<Category> categories = service.categories();
            for (Category cat: categories) {
                System.out.println("The category name is: "+cat.name());
            }
            index++ ;
        }

    } catch (SupportException e) {
        System.out.println(e.getLocalizedMessage());
        System.exit(1);
    }
}
}
```

- For API details, see [DescribeServices](#) in *AWS SDK for Java 2.x API Reference*.

## Kotlin

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/**
Before running this Kotlin code example, set up your development environment,
including your credentials.
```

```
For more information, see the following documentation topic:
https://docs.aws.amazon.com/sdk-for-kotlin/latest/developer-guide/setup.html
```

In addition, you must have the AWS Business Support Plan to use the AWS Support Java API. For more information, see:

<https://aws.amazon.com/premiumsupport/plans/>

This Kotlin example performs the following task:

```
1. Gets and displays available services.  
*/  
  
suspend fun main() {  
    displaySomeServices()  
}  
  
// Return a List that contains a Service name and Category name.  
suspend fun displaySomeServices() {  
    val servicesRequest = DescribeServicesRequest {  
        language = "en"  
    }  
  
    SupportClient { region = "us-west-2" }.use { supportClient ->  
        val response = supportClient.describeServices(servicesRequest)  
        println("Get the first 10 services")  
        var index = 1  
  
        response.services?.forEach { service ->  
            if (index == 11) {  
                return@forEach  
            }  
  
            println("The Service name is: " + service.name)  
  
            // Get the categories for this service.  
            service.categories?.forEach { cat ->  
                println("The category name is ${cat.name}")  
                index++  
            }  
        }  
    }  
}
```

- For API details, see [DescribeServices](#) in *AWS SDK for Kotlin API reference*.

## Actions

### Add a communication to a case

The following code example shows how to add an AWS Support communication with an attachment to a support case.

#### SDK for Kotlin

##### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun addAttachSupportCase(caseIdVal: String?, attachmentSetIdVal: String?) {
    val caseRequest = AddCommunicationToCaseRequest {
        caseId = caseIdVal
        attachmentSetId = attachmentSetIdVal
        communicationBody = "Please refer to attachment for details."
    }

    SupportClient { region = "us-west-2" }.use { supportClient ->
        val response = supportClient.addCommunicationToCase(caseRequest)
        if (response.result) {
            println("You have successfully added a communication to an AWS Support
case")
        } else {
            println("There was an error adding the communication to an AWS Support
case")
        }
    }
}
```

- For API details, see [AddCommunicationToCase](#) in *AWS SDK for Kotlin API reference*.

## Add an attachment to a set

The following code example shows how to add an AWS Support attachment to an attachment set.

### SDK for Kotlin

**Note**

This is prerelease documentation for a feature in preview release. It is subject to change.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun addAttachment(fileAttachment: String): String? {
    val myFile = File(fileAttachment)
    val sourceBytes = (File(fileAttachment).readBytes())
    val attachmentVal = Attachment {
        fileName = myFile.name
        data = sourceBytes
    }

    val setRequest = AddAttachmentsToSetRequest {
        attachments = listOf(attachmentVal)
    }

    SupportClient { region = "us-west-2" }.use { supportClient ->
        val response = supportClient.addAttachmentsToSet(setRequest)
        return response.attachmentSetId
    }
}
```

- For API details, see [AddAttachmentsToSet](#) in *AWS SDK for Kotlin API reference*.

## Create a case

The following code example shows how to create a new AWS Support case.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun createSupportCase(sevCatListVal: List<String>, sevLevelVal: String):  
String? {  
    val serCode = sevCatListVal[0]  
    val caseCategory = sevCatListVal[1]  
    val caseRequest = CreateCaseRequest {  
        categoryCode = caseCategory.lowercase(Locale.getDefault())  
        serviceCode = serCode.lowercase(Locale.getDefault())  
        severityCode = sevLevelVal.lowercase(Locale.getDefault())  
        communicationBody = "Test issue with ${serCode.lowercase(Locale.getDefault())}"  
        subject = "Test case, please ignore"  
        language = "en"  
        issueType = "technical"  
    }  
  
    SupportClient { region = "us-west-2" }.use { supportClient ->  
        val response = supportClient.createCase(caseRequest)  
        return response.caseId  
    }  
}
```

- For API details, see [CreateCase](#) in *AWS SDK for Kotlin API reference*.

## Describe an attachment

The following code example shows how to describe an attachment for an AWS Support case.

### SDK for Kotlin

#### Note

```
suspend fun getOpenCase() {
    // Specify the start and end time.
    val now = Instant.now()
    LocalDate.now()
    val yesterday = now.minus(1, ChronoUnit.DAYS)
    val describeCasesRequest = DescribeCasesRequest {
        maxResults = 20
        afterTime = yesterday.toString()
        beforeTime = now.toString()
    }

    SupportClient { region = "us-west-2" }.use { supportClient ->
        val response = supportClient.describeCases(describeCasesRequest)
        response.cases?.forEach { sinCase ->
            println("The case status is ${sinCase.status}")
            println("The case Id is ${sinCase.caseId}")
            println("The case subject is ${sinCase.subject}")
        }
    }
}
```

- For API details, see [DescribeCases](#) in *AWS SDK for Kotlin API reference*.

## Describe communications

The following code example shows how to describe AWS Support communications for a case.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun listCommunications(caseIdVal: String?): String? {
    val communicationsRequest = DescribeCommunicationsRequest {
        caseId = caseIdVal
        maxResults = 10
    }

    SupportClient { region = "us-west-2" }.use { supportClient ->
        val response = supportClient.describeCommunications(communicationsRequest)
        response.communications?.forEach { comm ->
            println("the body is: " + comm.body)
            comm.attachmentSet?.forEach { detail ->

```

```
        return detail.attachmentId
    }
}
return ""
}
```

- For API details, see [DescribeCommunications](#) in *AWS SDK for Kotlin API reference*.

## Describe services

The following code example shows how to describe the list of AWS services.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Return a List that contains a Service name and Category name.
suspend fun displayServices(): List<String> {
    var serviceCode = ""
    var catName = ""
    val sevCatList = mutableListOf<String>()
    val servicesRequest = DescribeServicesRequest {
        language = "en"
    }

    SupportClient { region = "us-west-2" }.use { supportClient ->
        val response = supportClient.describeServices(servicesRequest)
        println("Get the first 10 services")
        var index = 1

        response.services?.forEach { service ->
            if (index == 11) {
                return@forEach
            }

            println("The Service name is ${service.name}")
            if (service.name == "Account") {
                serviceCode = service.code.toString()
            }

            // Get the categories for this service.
            service.categories?.forEach { cat ->
                println("The category name is ${cat.name}")
                if (cat.name == "Security") {
                    catName = cat.name!!
                }
            }
            index++
        }
    }

    // Push the two values to the list.
    serviceCode.let { sevCatList.add(it) }
    catName.let { sevCatList.add(it) }
    return sevCatList
}
```

- For API details, see [DescribeServices](#) in *AWS SDK for Kotlin API reference*.

## Describe severity levels

The following code example shows how to describe AWS Support severity levels.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun displaySevLevels(): String {
    var levelName = ""
    val severityLevelsRequest = DescribeSeverityLevelsRequest {
        language = "en"
    }

    SupportClient { region = "us-west-2" }.use { supportClient ->
        val response = supportClient.describeSeverityLevels(severityLevelsRequest)
        response.severityLevels?.forEach { sevLevel ->
            println("The severity level name is: ${sevLevel.name}")
            if (sevLevel.name == "High") {
                levelName = sevLevel.name!!
            }
        }
    }
    return levelName
}
```

- For API details, see [DescribeSeverityLevels](#) in *AWS SDK for Kotlin API reference*.

## Resolve case

The following code example shows how to resolve an AWS Support case.

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun resolveSupportCase(caseIdVal: String) {
    val caseRequest = ResolveCaseRequest {
        caseId = caseIdVal
    }
    SupportClient { region = "us-west-2" }.use { supportClient ->
        val response = supportClient.resolveCase(caseRequest)
        println("The status of case $caseIdVal is ${response.finalCaseStatus}")
    }
}
```

- For API details, see [ResolveCase](#) in *AWS SDK for Kotlin API reference*.

## Scenarios

### Get started with cases

The following code example shows how to:

- Get and display available services and severity levels for cases.
- Create a support case using a selected service, category, and severity level.
- Get and display a list of open cases for the current day.
- Add an attachment set and a communication to the new case.
- Describe the new attachment and communication for the case.
- Resolve the case.
- Get and display a list of resolved cases for the current day.

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/**  
Before running this Kotlin code example, set up your development environment,  
including your credentials.  
  
For more information, see the following documentation topic:  
  
https://docs.aws.amazon.com/sdk-for-kotlin/latest/developer-guide/setup.html  
In addition, you must have the AWS Business Support Plan to use the AWS Support Java  
API. For more information, see:  
  
https://aws.amazon.com/premiumsupport/plans/  
  
This Kotlin example performs the following tasks:  
1. Gets and displays available services.  
2. Gets and displays severity levels.  
3. Creates a support case by using the selected service, category, and severity level.  
4. Gets a list of open cases for the current day.  
5. Creates an attachment set with a generated file.  
6. Adds a communication with the attachment to the support case.  
7. Lists the communications of the support case.  
8. Describes the attachment set included with the communication.  
9. Resolves the support case.  
10. Gets a list of resolved cases for the current day.  
*/

## Cross-service examples using SDK for Kotlin

The following sample applications use the AWS SDK for Kotlin to work across multiple AWS services.

### Examples

- [Build an application to submit data to a DynamoDB table \(p. 3663\)](#)
- [Build a publish and subscription application that translates messages \(p. 3663\)](#)
- [Create a web application that sends and retrieves messages by using the Amazon Simple Queue Service API \(p. 3664\)](#)
- [Create a web application to track DynamoDB data \(p. 3664\)](#)
- [Create an Amazon Redshift item tracker \(p. 3664\)](#)
- [Create an Aurora Serverless work item tracker \(p. 3664\)](#)
- [Detect objects in images with Amazon Rekognition using an AWS SDK \(p. 3665\)](#)

## Build an application to submit data to a DynamoDB table

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

Shows how to create a native Android application that submits data using the Amazon DynamoDB Kotlin API and sends a text message using the Amazon SNS Kotlin API.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- DynamoDB
- Amazon SNS

## Build a publish and subscription application that translates messages

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

Shows how to use the Amazon SNS Kotlin API to create an application that has subscription and publish functionality. In addition, this example application also translates messages.

For complete source code and instructions on how to create a web app, see the full example on [GitHub](#).

For complete source code and instructions on how to create a native Android app, see the full example on [GitHub](#).

### Services used in this example

- Amazon SNS
- Amazon Translate

## Create a web application that sends and retrieves messages by using the Amazon Simple Queue Service API

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

Shows how to use the Amazon Simple Queue Service API to develop a Spring REST API that sends and retrieves messages.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Comprehend
- Amazon SQS

## Create a web application to track DynamoDB data

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

Shows how to use the Amazon DynamoDB API to create a dynamic web application that tracks DynamoDB work data.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- DynamoDB
- Amazon SES

## Create an Amazon Redshift item tracker

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

Shows how to create a web application that tracks and reports on work items stored in an Amazon Redshift database.

For complete source code and instructions on how to set up a Spring REST API that queries Amazon Redshift data and for use by a React application, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Redshift
- Amazon SES

## Create an Aurora Serverless work item tracker

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

Shows how to create a web application that tracks and reports on work items stored in an Amazon RDS database.

For complete source code and instructions on how to set up a Spring REST API that queries Amazon Aurora Serverless data and for use by a React application, see the full example on [GitHub](#).

#### Services used in this example

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

## Detect objects in images with Amazon Rekognition using an AWS SDK

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

Shows how to use Amazon Rekognition Kotlin API to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

## Code examples for SDK for PHP

The code examples in this topic show you how to use the AWS SDK for PHP with AWS.

### Examples

- [Single-service actions and scenarios using SDK for PHP \(p. 3665\)](#)
- [Cross-service examples using SDK for PHP \(p. 3735\)](#)

## Single-service actions and scenarios using SDK for PHP

The following code examples show how to perform actions and implement common scenarios by using the AWS SDK for PHP with AWS services.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

## Services

- [API Gateway examples using SDK for PHP \(p. 3666\)](#)
- [DynamoDB examples using SDK for PHP \(p. 3669\)](#)
- [AWS Glue examples using SDK for PHP \(p. 3687\)](#)
- [IAM examples using SDK for PHP \(p. 3700\)](#)
- [Lambda examples using SDK for PHP \(p. 3711\)](#)
- [Amazon S3 examples using SDK for PHP \(p. 3717\)](#)
- [Amazon SNS examples using SDK for PHP \(p. 3724\)](#)

## API Gateway examples using SDK for PHP

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for PHP with Amazon API Gateway.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3666\)](#)

## Actions

### Get base path mapping

The following code example shows how to get an API Gateway base path mapping.

#### SDK for PHP

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
require 'vendor/autoload.php';

use Aws\ApiGateway\ApiGatewayClient;
use Aws\Exception\AwsException;

/*
 * Purpose: Gets the base path mapping for a custom domain name in
 * Amazon API Gateway.
 *
 * Prerequisites: A custom domain name in API Gateway. For more information,
 * see "Custom Domain Names" in the Amazon API Gateway Developer Guide.
 *
 * Inputs:
 * - $apiGatewayClient: An initialized AWS SDK for PHP API client for
 *   API Gateway.
 * - $basePath: The base path name that callers must provide as part of the
 *   URL after the domain name.
 * - $domainName: The custom domain name for the base path mapping.
 *
 * Returns: The base path mapping, if available; otherwise, the error message.
 */
function getBasePathMapping($apiGatewayClient, $basePath, $domainName)
```

```
{  
    try {  
        $result = $apiGatewayClient->getBasePathMapping([  
            'basePath' => $basePath,  
            'domainName' => $domainName,  
        ]);  
        return 'The base path mapping\'s effective URI is: ' .  
        $result['@metadata']['effectiveUri'];  
    } catch (AwsException $e) {  
        return 'Error: ' . $e['message'];  
    }  
}  
  
function getsTheBasePathMapping()  
{  
    $apiGatewayClient = new ApiGatewayClient([  
        'profile' => 'default',  
        'region' => 'us-east-1',  
        'version' => '2015-07-09'  
    ]);  
  
    echo getBasePathMapping($apiGatewayClient, '(none)', 'example.com');  
}  
  
// Uncomment the following line to run this code in an AWS account.  
// getsTheBasePathMapping();
```

- For API details, see [GetBasePathMapping](#) in *AWS SDK for PHP API Reference*.

## List base path mapping

The following code example shows how to list an API Gateway base path mapping.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
require 'vendor/autoload.php';  
  
use Aws\ApiGateway\ApiGatewayClient;  
use Aws\Exception\AwsException;  
  
/* ///////////////////////////////// * Purpose: Lists the base path mapping for a custom domain name in  
* Amazon API Gateway.  
*  
* Prerequisites: A custom domain name in API Gateway. For more information,  
* see "Custom Domain Names" in the Amazon API Gateway Developer Guide.  
*  
* Inputs:  
* - $apiGatewayClient: An initialized AWS SDK for PHP API client for  
*   API Gateway.  
* - $domainName: The custom domain name for the base path mappings.  
*  
* Returns: Information about the base path mappings, if available;  
* otherwise, the error message.  
* ////////////////////////////// */  
  
function listBasePathMappings($apiGatewayClient, $domainName)
```

```
{  
    try {  
        $result = $apiGatewayClient->getBasePathMappings([  
            'domainName' => $domainName  
        ]);  
        return 'The base path mapping(s) effective URI is: ' .  
            $result['@metadata']['effectiveUri'];  
    } catch (AwsException $e) {  
        return 'Error: ' . $e['message'];  
    }  
}  
  
function listThebasePathMappings()  
{  
    $apiGatewayClient = new ApiGatewayClient([  
        'profile' => 'default',  
        'region' => 'us-east-1',  
        'version' => '2015-07-09'  
    ]);  
  
    echo listBasePathMappings($apiGatewayClient, 'example.com');  
}  
  
// Uncomment the following line to run this code in an AWS account.  
// listThebasePathMappings();
```

- For API details, see [ListBasePathMappings](#) in *AWS SDK for PHP API Reference*.

## Update base path mapping

The following code example shows how to update an API Gateway base path mapping.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
require 'vendor/autoload.php';  
  
use Aws\ApiGateway\ApiGatewayClient;  
use Aws\Exception\AwsException;  
  
/* ////////////////////////////// */  
*  
* Purpose: Updates the base path mapping for a custom domain name  
* in Amazon API Gateway.  
*  
* Inputs:  
* - $apiGatewayClient: An initialized AWS SDK for PHP API client for  
*   API Gateway.  
* - $basePath: The base path name that callers must provide as part of the  
*   URL after the domain name.  
* - $domainName: The custom domain name for the base path mapping.  
* - $patchOperations: The base path update operations to apply.  
*  
* Returns: Information about the updated base path mapping, if available;  
* otherwise, the error message.  
* ////////////////////////////// */  
  
function updatebasePathMapping($apiGatewayClient, $basePath, $domainName,  
    $patchOperations)
```

```
{  
    try {  
        $result = $apiGatewayClient->updateBasePathMapping([  
            'basePath' => $basePath,  
            'domainName' => $domainName,  
            'patchOperations' => $patchOperations  
        ]);  
        return 'The updated base path\'s URI is: ' .  
            $result['@metadata']['effectiveUri'];  
    } catch (AwsException $e) {  
        return 'Error: ' . $e['message'];  
    }  
}  
  
function updateTheBasePathMapping()  
{  
    $patchOperations = array([  
        'op' => 'replace',  
        'path' => '/stage',  
        'value' => 'stage2'  
    ]);  
  
    $apiGatewayClient = new ApiGatewayClient([  
        'profile' => 'default',  
        'region' => 'us-east-1',  
        'version' => '2015-07-09'  
    ]);  
  
    echo updateBasePathMapping(  
        $apiGatewayClient,  
        '(none)',  
        'example.com',  
        $patchOperations);  
}  
  
// Uncomment the following line to run this code in an AWS account.  
// updateTheBasePathMapping();
```

- For API details, see [UpdateBasePathMapping](#) in *AWS SDK for PHP API Reference*.

## DynamoDB examples using SDK for PHP

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for PHP with Amazon DynamoDB.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3669\)](#)
- [Scenarios \(p. 3677\)](#)

## Actions

### Create a table

The following code example shows how to create a DynamoDB table.

## SDK for PHP

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a table.

```
$tableName = "ddb_demo_table_$uuid";
$service->createTable(
    $tableName,
    [
        new DynamoDBAttribute('year', 'N', 'HASH'),
        new DynamoDBAttribute('title', 'S', 'RANGE')
    ],
    [
        new DynamoDBAttribute('year', 'N', 'HASH'),
        new DynamoDBAttribute('title', 'S', 'RANGE')
    ]
);

public function createTable(string $tableName, array $attributes)
{
    $keySchema = [];
    $attributeDefinitions = [];
    foreach ($attributes as $attribute) {
        if (is_a($attribute, DynamoDBAttribute::class)) {
            $keySchema[] = ['AttributeName' => $attribute->AttributeName, 'KeyType' => $attribute->KeyType];
            $attributeDefinitions[] = ['AttributeName' => $attribute->AttributeName, 'AttributeType' => $attribute->AttributeType];
        }
    }

    $this->dynamoDbClient->createTable([
        'TableName' => $tableName,
        'KeySchema' => $keySchema,
        'AttributeDefinitions' => $attributeDefinitions,
        'ProvisionedThroughput' => ['ReadCapacityUnits' => 10, 'WriteCapacityUnits' => 10],
    ]);
}
```

- For API details, see [CreateTable](#) in *AWS SDK for PHP API Reference*.

## Delete a table

The following code example shows how to delete a DynamoDB table.

## SDK for PHP

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public function deleteTable(string $TableName)
{
    $this->customWaiter(function () use ($TableName) {
        return $this->dynamoDbClient->deleteTable([
            'TableName' => $TableName,
        ]);
    });
}
```

- For API details, see [DeleteTable](#) in *AWS SDK for PHP API Reference*.

## Delete an item from a table

The following code example shows how to delete an item from a DynamoDB table.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$key = [
    'Item' => [
        'title' => [
            'S' => $movieName,
        ],
        'year' => [
            'N' => $movieYear,
        ],
    ],
];
];

(service->deleteItemByKey($tableName, $key);
echo "But, bad news, this was a trap. That movie has now been deleted because
of your rating...harsh.\n";

public function deleteItemByKey(string $tableName, array $key)
{
    $this->dynamoDbClient->deleteItem([
        'Key' => $key['Item'],
        'TableName' => $tableName,
    ]);
}
```

- For API details, see [DeleteItem](#) in *AWS SDK for PHP API Reference*.

## Get an item from a table

The following code example shows how to get an item from a DynamoDB table.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$movie = $service->getItemByKey($tableName, $key);
echo "\nThe movie {$movie['Item']['title']['S']} was released in
{$movie['Item']['year']['N']}.\n";

public function getItemByKey(string $tableName, array $key)
{
    return $this->dynamoDbClient->getItem([
```

```
        'Key' => $key['Item'],
        'TableName' => $tableName,
    ]);
}
```

- For API details, see [GetItem](#) in *AWS SDK for PHP API Reference*.

## List tables

The following code example shows how to list DynamoDB tables.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public function listTables($exclusiveStartTableName = "", $limit = 100)
{
    $this->dynamoDbClient->listTables([
        'ExclusiveStartTableName' => $exclusiveStartTableName,
        'Limit' => $limit,
    ]);
}
```

- For API details, see [ListTables](#) in *AWS SDK for PHP API Reference*.

## Put an item in a table

The following code example shows how to put an item in a DynamoDB table.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
echo "What's the name of the last movie you watched?\n";
while (empty($movieName)) {
    $movieName = testable_readline("Movie name: ");
}
echo "And what year was it released?\n";
$movieYear = "year";
while (!is_numeric($movieYear) || intval($movieYear) != $movieYear) {
    $movieYear = testable_readline("Year released: ");
}

$service->putItem([
    'Item' => [
        'year' => [
            'N' => "$movieYear",
        ],
        'title' => [
            'S' => $movieName,
        ],
    ],
    'TableName' => $tableName,
])
```

```
    ]);

    public function putItem(array $array)
    {
        $this->dynamoDbClient->putItem($array);
    }
```

- For API details, see [PutItem](#) in *AWS SDK for PHP API Reference*.

## Query a table

The following code example shows how to query a DynamoDB table.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$birthKey = [
    'Key' => [
        'year' => [
            'N' => "$birthYear",
        ],
    ],
];
$result = $service->query($tableName, $birthKey);

public function query(string $tableName, $key)
{
    $expressionAttributeValues = [];
    $expressionAttributeNames = [];
    $keyConditionExpression = "";
    $index = 1;
    foreach ($key as $name => $value) {
        $keyConditionExpression .= "#" . array_key_first($value) . " = :v$index,";
        $expressionAttributeNames["#" . array_key_first($value)] =
array_key_first($value);
        $hold = array_pop($value);
        $expressionAttributeValues[":v$index"] = [
            array_key_first($hold) => array_pop($hold),
        ];
    }
    $keyConditionExpression = substr($keyConditionExpression, 0, -1);
    $query = [
        'ExpressionAttributeValues' => $expressionAttributeValues,
        'ExpressionAttributeNames' => $expressionAttributeNames,
        'KeyConditionExpression' => $keyConditionExpression,
        'TableName' => $tableName,
    ];
    return $this->dynamoDbClient->query($query);
}
```

- For API details, see [Query](#) in *AWS SDK for PHP API Reference*.

## Run a PartiQL statement

The following code example shows how to run a PartiQL statement on a DynamoDB table.

## SDK for PHP

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public function insertItemByPartiQL(string $statement, array $parameters)
{
    $this->dynamoDbClient->executeStatement([
        'Statement' => "$statement",
        'Parameters' => $parameters,
    ]);
}

public function getItemByPartiQL(string $tableName, array $key): Result
{
    list($statement, $parameters) = $this->buildStatementAndParameters("SELECT",
$tableName, $key['Item']);

    return $this->dynamoDbClient->executeStatement([
        'Parameters' => $parameters,
        'Statement' => $statement,
    ]);
}

public function updateItemByPartiQL(string $statement, array $parameters)
{
    $this->dynamoDbClient->executeStatement([
        'Statement' => $statement,
        'Parameters' => $parameters,
    ]);
}

public function deleteItemByPartiQL(string $statement, array $parameters)
{
    $this->dynamoDbClient->executeStatement([
        'Statement' => $statement,
        'Parameters' => $parameters,
    ]);
}
```

- For API details, see [ExecuteStatement](#) in *AWS SDK for PHP API Reference*.

## Run batches of PartiQL statements

The following code example shows how to run batches of PartiQL statements on a DynamoDB table.

## SDK for PHP

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public function getItemByPartiQLBatch(string $tableName, array $keys): Result
{
    $statements = [];
    foreach ($keys as $key) {
        list($statement, $parameters) = $this-
>buildStatementAndParameters("SELECT", $tableName, $key['Item']);
        $statements[] = [
            'Statement' => "$statement",

```

```
        'Parameters' => $parameters,
    ];
}

return $this->dynamoDbClient->batchExecuteStatement([
    'Statements' => $statements,
]);
}

public function insertItemByPartiQLBatch(string $statement, array $parameters)
{
    $this->dynamoDbClient->batchExecuteStatement([
        'Statements' => [
            [
                'Statement' => "$statement",
                'Parameters' => $parameters,
            ],
        ],
    ]);
}

public function updateItemByPartiQLBatch(string $statement, array $parameters)
{
    $this->dynamoDbClient->batchExecuteStatement([
        'Statements' => [
            [
                'Statement' => "$statement",
                'Parameters' => $parameters,
            ],
        ],
    ]);
}

public function deleteItemByPartiQLBatch(string $statement, array $parameters)
{
    $this->dynamoDbClient->batchExecuteStatement([
        'Statements' => [
            [
                'Statement' => "$statement",
                'Parameters' => $parameters,
            ],
        ],
    ]);
}
```

- For API details, see [BatchExecuteStatement](#) in *AWS SDK for PHP API Reference*.

## Scan a table

The following code example shows how to scan a DynamoDB table.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$yearsKey = [
    'Key' => [
        'year' => [
            'N' => [
                'minRange' => 1990,
```

```
        'maxRange' => 1999,
    ],
],
];
$filter = "year between 1990 and 1999";
echo "\nHere's a list of all the movies released in the 90s:\n";
$result = $service->scan($tableName, $yearsKey, $filter);
foreach ($result['Items'] as $movie) {
    $movie = $marshal->unmarshalItem($movie);
    echo $movie['title'] . "\n";
}

public function scan(string $tableName, array $key, string $filters)
{
    $query = [
        'ExpressionAttributeNames' => ['#year' => 'year'],
        'ExpressionAttributeValues' => [
            ':min' => ['N' => '1990'],
            ':max' => ['N' => '1999'],
        ],
        'FilterExpression' => "#year between :min and :max",
        'TableName' => $tableName,
    ];
    return $this->dynamoDbClient->scan($query);
}
```

- For API details, see [Scan](#) in *AWS SDK for PHP API Reference*.

## Update an item in a table

The following code example shows how to update an item in a DynamoDB table.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
echo "What rating would you like to give {$movie['Item']['title']['S']}?\n";
$rating = 0;
while (!is_numeric($rating) || intval($rating) != $rating || $rating < 1 || $rating > 10) {
    $rating = testable_readline("Rating (1-10): ");
}
	service->updateItemAttributeByKey($tableName, $key, 'rating', 'N', $rating);

public function updateItemAttributeByKey(
    string $tableName,
    array $key,
    string $attributeName,
    string $attributeType,
    string $newValue
) {
    $this->dynamoDbClient->updateItem([
        'Key' => $key['Item'],
        'TableName' => $tableName,
        'UpdateExpression' => "set #NV=:NV",
        'ExpressionAttributeNames' => [
            '#NV' => $attributeName,
        ],
        'ExpressionAttributeValues' => [
            ':NV' => $newValue,
        ],
    ]);
}
```

```
        ':NV' => [
            $attributeType => $newValue
        ],
    ],
});
```

- For API details, see [UpdateItem](#) in *AWS SDK for PHP API Reference*.

## Write a batch of items

The following code example shows how to write a batch of DynamoDB items.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public function writeBatch(string $TableName, array $Batch, int $depth = 2)
{
    if (--$depth <= 0) {
        throw new Exception("Max depth exceeded. Please try with fewer batch items or increase depth.");
    }

    $marshal = new Marshaler();
    $total = 0;
    foreach (array_chunk($Batch, 25) as $Items) {
        foreach ($Items as $Item) {
            $BatchWrite['RequestItems'][$TableName][] = ['PutRequest' => ['Item' => $marshal->marshalItem($Item)]];
        }
        try {
            echo "Batching another " . count($Items) . " for a total of " . ($total += count($Items)) . " items!\n";
            $response = $this->dynamoDbClient->batchWriteItem($BatchWrite);
            $BatchWrite = [];
        } catch (Exception $e) {
            echo "uh oh...";
            echo $e->getMessage();
            die();
        }
        if ($total >= 250) {
            echo "250 movies is probably enough. Right? We can stop there.\n";
            break;
        }
    }
}
```

- For API details, see [BatchWriteItem](#) in *AWS SDK for PHP API Reference*.

## Scenarios

### Get started using tables, items, and queries

The following code example shows how to:

- Create a table that can hold movie data.

- Put, get, and update a single movie in the table.
- Write movie data to the table from a sample JSON file.
- Query for movies that were released in a given year.
- Scan for movies that were released in a range of years.
- Delete a movie from the table.
- Delete the table.

## SDK for PHP

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
namespace DynamoDb\Basics;

use Aws\DynamoDb\Marshaler;
use DynamoDb;
use DynamoDb\DynamoDBAttribute;

## Query a table by using batches of PartiQL statements

The following code example shows how to:

- Get a batch of items by running multiple SELECT statements.
- Add a batch of items by running multiple INSERT statements.
- Update a batch of items by running multiple UPDATE statements.
- Delete a batch of items by running multiple DELETE statements.

## AWS Glue examples using SDK for PHP

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for PHP with AWS Glue.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3688\)](#)
- [Scenarios \(p. 3695\)](#)

## Actions

### Create a crawler

The following code example shows how to create an AWS Glue crawler.

#### SDK for PHP

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$crawlerName = "example-crawler-test-" . $uniqid;

$role = $iamService->getRole("AWSGlueServiceRole-DocExample");

$path = 's3://crawler-public-us-east-1/flight/2016/csv';
$glueService->createCrawler($crawlerName, $role['Role']['Arn'], $databaseName,
$path);

public function createCrawler($crawlerName, $role, $databaseName, $path): Result
{
    return $this->customWaiter(function () use ($crawlerName, $role, $databaseName,
$path) {
        return $this->glueClient->createCrawler([
            'Name' => $crawlerName,
            'Role' => $role,
            'DatabaseName' => $databaseName,
            'Targets' => [
                'S3Targets' =>
                [
                    [
                        'Path' => $path,
                    ]
                ],
            ],
        ]);
    });
}
```

- For API details, see [CreateCrawler](#) in *AWS SDK for PHP API Reference*.

### Create a job definition

The following code example shows how to create an AWS Glue job definition.

#### SDK for PHP

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$role = $iamService->getRole("AWSGlueServiceRole-DocExample");

$jobName = 'test-job-' . $uniqid;

$scriptLocation = "s3://$bucketName/run_job.py";
$job = $glueService->createJob($jobName, $role['Role']['Arn'],
$scriptLocation);
```

```
    public function createJob($jobName, $role, $scriptLocation, $pythonVersion = '3',  
    $glueVersion = '3.0'): Result  
    {  
        return $this->glueClient->createJob([  
            'Name' => $jobName,  
            'Role' => $role,  
            'Command' => [  
                'Name' => 'glueetl',  
                'ScriptLocation' => $scriptLocation,  
                'PythonVersion' => $pythonVersion,  
            ],  
            'GlueVersion' => $glueVersion,  
        ]);  
    }  
}
```

- For API details, see [CreateJob](#) in *AWS SDK for PHP API Reference*.

## Delete a crawler

The following code example shows how to delete an AWS Glue crawler.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
echo "Delete the crawler.\n";  
$glueClient->deleteCrawler([  
    'Name' => $crawlerName,  
]);  
  
public function deleteCrawler($crawlerName)  
{  
    return $this->glueClient->deleteCrawler([  
        'Name' => $crawlerName,  
    ]);  
}
```

- For API details, see [DeleteCrawler](#) in *AWS SDK for PHP API Reference*.

## Delete a database from the Data Catalog

The following code example shows how to delete a database from the AWS Glue Data Catalog.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
echo "Delete the databases.\n";  
$glueClient->deleteDatabase([  
    'Name' => $databaseName,  
]);
```

```
public function deleteDatabase($databaseName)
{
    return $this->glueClient->deleteDatabase([
        'Name' => $databaseName,
    ]);
}
```

- For API details, see [DeleteDatabase](#) in *AWS SDK for PHP API Reference*.

## Delete a job definition

The following code example shows how to delete an AWS Glue job definition and all associated runs.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
echo "Delete the job.\n";
$glueClient->deleteJob([
    'JobName' => $job['Name'],
]);

public function deleteJob($jobName)
{
    return $this->glueClient->deleteJob([
        'JobName' => $jobName,
    ]);
}
```

- For API details, see [DeleteJob](#) in *AWS SDK for PHP API Reference*.

## Delete a table from a database

The following code example shows how to delete a table from an AWS Glue Data Catalog database.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
echo "Delete the tables.\n";
foreach ($tables['TableList'] as $table) {
    $glueService->deleteTable($table['Name'], $databaseName);
}

public function deleteTable($tableName, $databaseName)
{
    return $this->glueClient->deleteTable([
        'DatabaseName' => $databaseName,
        'Name' => $tableName,
    ]);
}
```

- For API details, see [DeleteTable](#) in *AWS SDK for PHP API Reference*.

## Get a crawler

The following code example shows how to get an AWS Glue crawler.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
echo "Waiting for crawler";
do {
    $crawler = $glueService->getCrawler($crawlerName);
    echo ".";
    sleep(10);
} while ($crawler['Crawler']['State'] != "READY");
echo "\n";

public function getCrawler($crawlerName)
{
    return $this->customWaiter(function () use ($crawlerName) {
        return $this->glueClient->getCrawler([
            'Name' => $crawlerName,
        ]);
    });
}
```

- For API details, see [GetCrawler](#) in *AWS SDK for PHP API Reference*.

## Get a database from the Data Catalog

The following code example shows how to get a database from the AWS Glue Data Catalog.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$databaseName = "doc-example-database-$uniqid";

public function getDatabase(string $databaseName): Result
{
    return $this->customWaiter(function () use ($databaseName) {
        return $this->glueClient->getDatabase([
            'Name' => $databaseName,
        ]);
    });
}
```

- For API details, see [GetDatabase](#) in *AWS SDK for PHP API Reference*.

## Get a job run

The following code example shows how to get an AWS Glue job run.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$jobName = 'test-job-' . $uniqid;

$outputBucketUrl = "s3://$bucketName";
$runId = $glueService->startJobRun($jobName, $databaseName, $tables,
$outputBucketUrl)['JobRunId'];

echo "waiting for job";
do {
    $jobRun = $glueService->getJobRun($jobName, $runId);
    echo ".";
    sleep(10);
} while (!array_intersect([$jobRun['JobRun']['JobRunState']], ['SUCCEEDED',
'STOPPED', 'FAILED', 'TIMEOUT']));
echo "\n";

public function getJobRun($jobName, $runId, $predecessorsIncluded = false): Result
{
    return $this->glueClient->getJobRun([
        'JobName' => $jobName,
        'RunId' => $runId,
        'PredecessorsIncluded' => $predecessorsIncluded,
    ]);
}
```

- For API details, see [GetJobRun](#) in *AWS SDK for PHP API Reference*.

## Get runs of a job

The following code example shows how to get runs of an AWS Glue job.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$jobName = 'test-job-' . $uniqid;

$jobRuns = $glueService->getJobRuns($jobName);

public function getJobRuns($jobName, $maxResults = 0, $nextToken = ''): Result
{
    $arguments = ['JobName' => $jobName];
    if ($maxResults) {
        $arguments['MaxResults'] = $maxResults;
    }
    if ($nextToken) {
        $arguments['NextToken'] = $nextToken;
    }
    return $this->glueClient->getJobRuns($arguments);
```

```
}
```

- For API details, see [GetJobRuns](#) in *AWS SDK for PHP API Reference*.

## Get tables from a database

The following code example shows how to get tables from a database in the AWS Glue Data Catalog.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$databaseName = "doc-example-database-$uniqid";

$tables = $glueService->getTables($databaseName);

public function getTables($databaseName): Result
{
    return $this->glueClient->getTables([
        'DatabaseName' => $databaseName,
    ]);
}
```

- For API details, see [GetTables](#) in *AWS SDK for PHP API Reference*.

## List job definitions

The following code example shows how to list AWS Glue job definitions.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$jobs = $glueService->listJobs();
echo "Current jobs:\n";
foreach ($jobs['JobNames'] as $jobsName) {
    echo "{$jobsName}\n";
}

public function listJobs($maxResults = null, $nextToken = null, $tags = []): Result
{
    $arguments = [];
    if ($maxResults) {
        $arguments['MaxResults'] = $maxResults;
    }
    if ($nextToken) {
        $arguments['NextToken'] = $nextToken;
    }
    if (!isEmpty($tags)) {
        $arguments['Tags'] = $tags;
    }
    return $this->glueClient->listJobs($arguments);
}
```

- For API details, see [ListJobs](#) in *AWS SDK for PHP API Reference*.

## Start a crawler

The following code example shows how to start an AWS Glue crawler.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$crawlerName = "example-crawler-test-" . $uniqid;  
  
$databaseName = "doc-example-database-$uniqid";  
  
$glueService->startCrawler($crawlerName);  
  
public function startCrawler($crawlerName): Result  
{  
    return $this->glueClient->startCrawler([  
        'Name' => $crawlerName,  
    ]);  
}
```

- For API details, see [StartCrawler](#) in *AWS SDK for PHP API Reference*.

## Start a job run

The following code example shows how to start an AWS Glue job run.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$jobName = 'test-job-' . $uniqid;  
  
$databaseName = "doc-example-database-$uniqid";  
  
$tables = $glueService->getTables($databaseName);  
  
$outputBucketUrl = "s3://$bucketName";  
$runId = $glueService->startJobRun($jobName, $databaseName, $tables,  
$outputBucketUrl)['JobRunId'];  
  
public function startJobRun($jobName, $databaseName, $tables, $outputBucketUrl):  
Result  
{  
    return $this->glueClient->startJobRun([  
        'JobName' => $jobName,  
        'Arguments' => [  
            'input_database' => $databaseName,  
            'input_table' => $tables['TableList'][0]['Name'],  
            'output_bucket_url' => $outputBucketUrl,
```

```
        '--input_database' => $databaseName,
        '--input_table' => $tables['TableList'][0]['Name'],
        '--output_bucket_url' => $outputBucketUrl,
    ],
]);
}
```

- For API details, see [StartJobRun](#) in *AWS SDK for PHP API Reference*.

## Scenarios

### Get started running crawlers and jobs

The following code example shows how to:

- Create and run a crawler that crawls a public Amazon Simple Storage Service (Amazon S3) bucket and generates a metadata database that describes the CSV-formatted data it finds.
- List information about databases and tables in your AWS Glue Data Catalog.
- Create and run a job that extracts CSV data from the source Amazon S3 bucket, transforms it by removing and renaming fields, and loads JSON-formatted output into another Amazon S3 bucket.
- List information about job runs and view some of the transformed data.
- Delete all resources created by the demo.

For more information, see [Tutorial: Getting started with AWS Glue Studio](#).

## IAM examples using SDK for PHP

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for PHP with AWS Identity and Access Management.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3701\)](#)
- [Scenarios \(p. 3709\)](#)

## Actions

### Attach a policy to a role

The following code example shows how to attach an IAM policy to a role.

#### SDK for PHP

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$uuid = uniqid();
$service = new IamService();

$assumeRolePolicyDocument = "{
    \"Version\": \"2012-10-17\",
    \"Statement\": [
        {
            \"Effect\": \"Allow\",
            \"Principal\": \"{\\\"AWS\\\": \\"${user['Arn']}\\\"}\",
            \"Action\": \"sts:AssumeRole\"
        }
    ]
}";
$assumeRoleRole = $service->createRole("iam_demo_role_$uuid",
    $assumeRolePolicyDocument);
echo "Created role: {$assumeRoleRole['RoleName']}\n";

$listAllBucketsPolicyDocument = "{
    \"Version\": \"2012-10-17\",
    \"Statement\": [
        {
            \"Effect\": \"Allow\",
            \"Action\": \"s3>ListAllMyBuckets\",
            \"Resource\": \"arn:aws:s3:::*\\\"}]
}";
$listAllBucketsPolicy = $service->createPolicy("iam_demo_policy_$uuid",
    $listAllBucketsPolicyDocument);
echo "Created policy: {$listAllBucketsPolicy['PolicyName']}\n";

$service->attachRolePolicy($assumeRoleRole['RoleName'], $listAllBucketsPolicy['Arn']);

    public function attachRolePolicy($roleName, $policyArn)
    {
        return $this->customWaiter(function () use ($roleName, $policyArn) {
            $this->iamClient->attachRolePolicy([
                'PolicyArn' => $policyArn,
                'RoleName' => $roleName,
            ]);
        });
    }
}
```

- For API details, see [AttachRolePolicy](#) in *AWS SDK for PHP API Reference*.

## Create a policy

The following code example shows how to create an IAM policy.

#### SDK for PHP

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$uuid = uniqid();
$service = new IamService();

$listAllBucketsPolicyDocument = "{
    \"Version\": \"2012-10-17\",
    \"Statement\": [
        {
            \"Effect\": \"Allow\",
            \"Action\": \"s3>ListAllMyBuckets\",
            \"Resource\": \"arn:aws:s3:::*\"}
    ]
}";
$listAllBucketsPolicy = $service->createPolicy("iam_demo_policy_$uuid",
    $listAllBucketsPolicyDocument);
echo "Created policy: {$listAllBucketsPolicy['PolicyName']}\n";

public function createPolicy(string $policyName, string $policyDocument)
{
    $result = $this->customWaiter(function () use ($policyName, $policyDocument) {
        return $this->iamClient->createPolicy([
            'PolicyName' => $policyName,
            'PolicyDocument' => $policyDocument,
        ]);
    });
    return $result['Policy'];
}
```

- For API details, see [CreatePolicy](#) in *AWS SDK for PHP API Reference*.

## Create a role

The following code example shows how to create an IAM role.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$uuid = uniqid();
$service = new IamService();

$assumeRolePolicyDocument = "{
    \"Version\": \"2012-10-17\",
    \"Statement\": [
        {
            \"Effect\": \"Allow\",
            \"Principal\": \"$user[\"Arn\"]\",
            \"Action\": \"sts:AssumeRole\"
        }
    ]
}";
$assumeRoleRole = $service->createRole("iam_demo_role_$uuid",
    $assumeRolePolicyDocument);
echo "Created role: {$assumeRoleRole['RoleName']}\n";

/**
 * @param string $roleName
 * @param string $rolePolicyDocument
 * @return array
 * @throws AwsException
 */
public function createRole(string $roleName, string $rolePolicyDocument)
{
```

```
    $result = $this->customWaiter(function () use ($roleName, $rolePolicyDocument)
{
    return $this->iamClient->createRole([
        'AssumeRolePolicyDocument' => $rolePolicyDocument,
        'RoleName' => $roleName,
    ]);
});
return $result['Role'];
}
```

- For API details, see [CreateRole](#) in *AWS SDK for PHP API Reference*.

## Create a service-linked role

The following code example shows how to create an IAM service-linked role.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$uuid = uniqid();
$service = new IamService();

public function createServiceLinkedRole($awsServiceName, $customSuffix = "",
$description = "")
{
    $createServiceLinkedRoleArguments = ['AWSServiceName' => $awsServiceName];
    if ($customSuffix) {
        $createServiceLinkedRoleArguments['CustomSuffix'] = $customSuffix;
    }
    if ($description) {
        $createServiceLinkedRoleArguments['Description'] = $description;
    }
    return $this->iamClient-
>createServiceLinkedRole($createServiceLinkedRoleArguments);
}
```

- For API details, see [CreateServiceLinkedRole](#) in *AWS SDK for PHP API Reference*.

## Create a user

The following code example shows how to create an IAM user.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$uuid = uniqid();
$service = new IamService();

$user = $service->createUser("iam_demo_user_$uuid");
echo "Created user with the arn: {$user['Arn']}\n";
```

```
/**  
 * @param string $name  
 * @return array  
 * @throws AwsException  
 */  
public function createUser(string $name): array  
{  
    $result = $this->iamClient->createUser([  
        'UserName' => $name,  
    ]);  
  
    return $result['User'];  
}
```

- For API details, see [CreateUser](#) in *AWS SDK for PHP API Reference*.

## Get a policy

The following code example shows how to get an IAM policy.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$uuid = uniqid();  
$service = new IamService();  
  
public function getPolicy($policyArn)  
{  
    return $this->customWaiter(function () use ($policyArn) {  
        return $this->iamClient->getPolicy(['PolicyArn' => $policyArn]);  
    });  
}
```

- For API details, see [GetPolicy](#) in *AWS SDK for PHP API Reference*.

## Get a role

The following code example shows how to get an IAM role.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$uuid = uniqid();  
$service = new IamService();  
  
public function getRole($roleName)  
{  
    return $this->customWaiter(function () use ($roleName) {  
        return $this->iamClient->getRole(['RoleName' => $roleName]);  
    });  
}
```

- For API details, see [GetRole](#) in *AWS SDK for PHP API Reference*.

## Get the account password policy

The following code example shows how to get the IAM account password policy.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$uuid = uniqid();
$service = new IamService();

    public function getAccountPasswordPolicy()
    {
        return $this->iamClient->getAccountPasswordPolicy();
    }
```

- For API details, see [GetAccountPasswordPolicy](#) in *AWS SDK for PHP API Reference*.

## List SAML providers

The following code example shows how to list SAML providers for IAM.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$uuid = uniqid();
$service = new IamService();

    public function listSAMLProviders()
    {
        return $this->iamClient->listSAMLProviders();
    }
```

- For API details, see [ListSAMLProviders](#) in *AWS SDK for PHP API Reference*.

## List groups

The following code example shows how to list IAM groups.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$uuid = uniqid();
```

```
$service = new IamService();

    public function listGroups($pathPrefix = "", $marker = "", $maxItems = 0)
    {
        $listGroupsArguments = [];
        if ($pathPrefix) {
            $listGroupsArguments["PathPrefix"] = $pathPrefix;
        }
        if ($marker) {
            $listGroupsArguments["Marker"] = $marker;
        }
        if ($maxItems) {
            $listGroupsArguments["MaxItems"] = $maxItems;
        }

        return $this->iamClient->listGroups($listGroupsArguments);
    }
}
```

- For API details, see [ListGroups](#) in *AWS SDK for PHP API Reference*.

## List inline policies for a role

The following code example shows how to list inline policies for an IAM role.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$uuid = uniqid();
$service = new IamService();

    public function listRolePolicies($roleName, $marker = "", $maxItems = 0)
    {
        $listRolePoliciesArguments = ['RoleName' => $roleName];
        if ($marker) {
            $listRolePoliciesArguments['Marker'] = $marker;
        }
        if ($maxItems) {
            $listRolePoliciesArguments['MaxItems'] = $maxItems;
        }
        return $this->customWaiter(function () use ($listRolePoliciesArguments) {
            return $this->iamClient->listRolePolicies($listRolePoliciesArguments);
        });
    }
}
```

- For API details, see [ListRolePolicies](#) in *AWS SDK for PHP API Reference*.

## List policies

The following code example shows how to list IAM policies.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$uuid = uniqid();
$service = new IamService();

    public function listPolicies($pathPrefix = "", $marker = "", $maxItems = 0)
    {
        $listPoliciesArguments = [];
        if ($pathPrefix) {
            $listPoliciesArguments["PathPrefix"] = $pathPrefix;
        }
        if ($marker) {
            $listPoliciesArguments["Marker"] = $marker;
        }
        if ($maxItems) {
            $listPoliciesArguments["MaxItems"] = $maxItems;
        }

        return $this->iamClient->listPolicies($listPoliciesArguments);
    }
```

- For API details, see [ListPolicies](#) in *AWS SDK for PHP API Reference*.

## List policies attached to a role

The following code example shows how to list policies attached to an IAM role.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$uuid = uniqid();
$service = new IamService();

    public function listAttachedRolePolicies($roleName, $pathPrefix = "", $marker = "", $maxItems = 0)
    {
        $listAttachRolePoliciesArguments = ['RoleName' => $roleName];
        if ($pathPrefix) {
            $listAttachRolePoliciesArguments['PathPrefix'] = $pathPrefix;
        }
        if ($marker) {
            $listAttachRolePoliciesArguments['Marker'] = $marker;
        }
        if ($maxItems) {
            $listAttachRolePoliciesArguments['MaxItems'] = $maxItems;
        }
        return $this->iamClient-
>listAttachedRolePolicies($listAttachRolePoliciesArguments);
    }
```

## List roles

The following code example shows how to list IAM roles.

## SDK for PHP

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$uuid = uniqid();
$service = new IamService();

/**
 * @param string $pathPrefix
 * @param string $marker
 * @param int $maxItems
 * @return Result
 * $roles = $service->listRoles();
 */
public function listRoles($pathPrefix = "", $marker = "", $maxItems = 0)
{
    $listRolesArguments = [];
    if ($pathPrefix) {
        $listRolesArguments["PathPrefix"] = $pathPrefix;
    }
    if ($marker) {
        $listRolesArguments["Marker"] = $marker;
    }
    if ($maxItems) {
        $listRolesArguments["MaxItems"] = $maxItems;
    }
    return $this->iamClient->listRoles($listRolesArguments);
}
```

- For API details, see [ListRoles](#) in *AWS SDK for PHP API Reference*.

## List users

The following code example shows how to list IAM users.

## SDK for PHP

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$uuid = uniqid();
$service = new IamService();

public function listUsers($pathPrefix = "", $marker = "", $maxItems = 0)
{
    $listUsersArguments = [];
    if ($pathPrefix) {
        $listUsersArguments["PathPrefix"] = $pathPrefix;
    }
    if ($marker) {
        $listUsersArguments["Marker"] = $marker;
    }
    if ($maxItems) {
        $listUsersArguments["MaxItems"] = $maxItems;
    }

    return $this->iamClient->listUsers($listUsersArguments);
```

```
}
```

- For API details, see [ListUsers](#) in *AWS SDK for PHP API Reference*.

## Scenarios

### Create a user and assume a role

The following code example shows how to:

- Create a user who has no permissions.
- Create a role that grants permission to list Amazon S3 buckets for the account.
- Add a policy to let the user assume the role.
- Assume the role and list Amazon S3 buckets using temporary credentials.
- Delete the policy, role, and user.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
namespace Iam\Basics;

## Lambda examples using SDK for PHP

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for PHP with AWS Lambda.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3711\)](#)
- [Scenarios \(p. 3714\)](#)

## Actions

### Create a function

The following code example shows how to create a Lambda function.

#### SDK for PHP

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public function createFunction($functionName, $role, $bucketName, $handler)
{
    //This assumes the Lambda function is in an S3 bucket.
    return $this->customWaiter(function () use ($functionName, $role, $bucketName,
$handler) {
        return $this->lambdaClient->createFunction([
            'Code' => [
                'S3Bucket' => $bucketName,
                'S3Key' => $functionName,
            ],
            'FunctionName' => $functionName,
            'Role' => $role['Arn'],
            'Runtime' => 'python3.9',
            'Handler' => "$handler.lambda_handler",
        ]);
    });
}
```

- For API details, see [CreateFunction](#) in *AWS SDK for PHP API Reference*.

## Delete a function

The following code example shows how to delete a Lambda function.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public function deleteFunction($functionName)
{
    return $this->lambdaClient->deleteFunction([
        'FunctionName' => $functionName,
    ]);
}
```

- For API details, see [DeleteFunction](#) in *AWS SDK for PHP API Reference*.

## Get a function

The following code example shows how to get a Lambda function.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public function getFunction($functionName)
{
    return $this->lambdaClient->getFunction([
        'FunctionName' => $functionName,
    ]);
}
```

- For API details, see [GetFunction](#) in *AWS SDK for PHP API Reference*.

## Invoke a function

The following code example shows how to invoke a Lambda function.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public function invoke($functionName, $params, $logType = 'None')
```

```
        return $this->lambdaClient->invoke([
            'FunctionName' => $functionName,
            'Payload' => json_encode($params),
            'LogType' => $logType,
        ]);
    }
```

- For API details, see [Invoke](#) in *AWS SDK for PHP API Reference*.

## List functions

The following code example shows how to list Lambda functions.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public function listFunctions($maxItems = 50, $marker = null)
{
    if (is_null($marker)) {
        return $this->lambdaClient->listFunctions([
            'MaxItems' => $maxItems,
        ]);
    }

    return $this->lambdaClient->listFunctions([
        'Marker' => $marker,
        'MaxItems' => $maxItems,
    ]);
}
```

- For API details, see [ListFunctions](#) in *AWS SDK for PHP API Reference*.

## Update function code

The following code example shows how to update Lambda function code.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public function updateFunctionCode($functionName, $s3Bucket, $s3Key)
{
    return $this->lambdaClient->updateFunctionCode([
        'FunctionName' => $functionName,
        'S3Bucket' => $s3Bucket,
        'S3Key' => $s3Key,
    ]);
}
```

- For API details, see [UpdateFunctionCode](#) in *AWS SDK for PHP API Reference*.

## Update function configuration

The following code example shows how to update Lambda function configuration.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public function updateFunctionConfiguration($functionName, $handler, $environment = '') {
    {
        return $this->lambdaClient->updateFunctionConfiguration([
            'FunctionName' => $functionName,
            'Handler' => "$handler.lambda_handler",
            'Environment' => $environment,
        ]);
    }
}
```

- For API details, see [UpdateFunctionConfiguration](#) in *AWS SDK for PHP API Reference*.

## Scenarios

### Get started with functions

The following code example shows how to:

- Create an AWS Identity and Access Management (IAM) role that grants Lambda permission to write to logs.
- Create a Lambda function and upload handler code.
- Invoke the function with a single parameter and get results.
- Update the function code and configure its Lambda environment with an environment variable.
- Invoke the function with new parameters and get results. Display the execution log that's returned from the invocation.
- List the functions for your account.
- Delete the IAM role and the Lambda function.

For more information, see [Create a Lambda function with the console](#).

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
namespace Lambda;

use Aws\S3\S3Client;
use GuzzleHttp\Psr7\Stream;
use Iam\IamService;

## Amazon S3 examples using SDK for PHP

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for PHP with Amazon Simple Storage Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3718\)](#)
- [Scenarios \(p. 3721\)](#)

## Actions

### Copy an object from one bucket to another

The following code example shows how to copy an S3 object from one bucket to another.

#### SDK for PHP

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Simple copy of an object.

```
$s3client = new Aws\S3\S3Client(['region' => 'us-west-2', 'version' => 'latest']);

try {
    $folder = "copied-folder";
    $s3client->copyObject([
        'Bucket' => $bucket_name,
        'CopySource' => "$bucket_name/$file_name",
        'Key' => "$folder/$file_name-copy",
    ]);
    echo "Copied $file_name to $folder/$file_name-copy.\n";
} catch (Exception $exception) {
    echo "Failed to copy $file_name with error: " . $exception->getMessage();
    exit("Please fix error with object copying before continuing.");
}
```

- For API details, see [CopyObject](#) in *AWS SDK for PHP API Reference*.

## Create a bucket

The following code example shows how to create an S3 bucket.

#### SDK for PHP

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a bucket.

```
$s3client = new Aws\S3\S3Client(['region' => 'us-west-2', 'version' => 'latest']);

try {
    $s3client->createBucket([
        'Bucket' => $bucket_name,
        'CreateBucketConfiguration' => ['LocationConstraint' => $region],
    ]);
    echo "Created bucket named: $bucket_name \n";
} catch (Exception $exception) {
```

```
    echo "Failed to create bucket $bucket_name with error: " . $exception->getMessage();
    exit("Please fix error with bucket creation before continuing.");
}
```

- For API details, see [CreateBucket](#) in *AWS SDK for PHP API Reference*.

## Delete an empty bucket

The following code example shows how to delete an empty S3 bucket.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Delete an empty bucket.

```
$s3client = new Aws\S3\S3Client(['region' => 'us-west-2', 'version' => 'latest']);

try {
    $s3client->deleteBucket([
        'Bucket' => $bucket_name,
    ]);
    echo "Deleted bucket $bucket_name.\n";
} catch (Exception $exception) {
    echo "Failed to delete $bucket_name with error: " . $exception->getMessage();
    exit("Please fix error with bucket deletion before continuing.");
}
```

- For API details, see [DeleteBucket](#) in *AWS SDK for PHP API Reference*.

## Delete multiple objects

The following code example shows how to delete multiple objects from an S3 bucket.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Delete a set of objects from a list of keys.

```
$s3client = new Aws\S3\S3Client(['region' => 'us-west-2', 'version' => 'latest']);

try {
    $objects = [];
    foreach ($contents['Contents'] as $content) {
        $objects[] = [
            'Key' => $content['Key'],
        ];
    }
    $s3client->deleteObjects([
        'Bucket' => $bucket_name,
        'Key' => $file_name,
        'Delete' => [
            'Objects' => $objects,
        ],
    ],
}
```

```
]);
$check = $s3client->listObjects([
    'Bucket' => $bucket_name,
]);
if (count($check) <= 0) {
    throw new Exception("Bucket wasn't empty.");
}
echo "Deleted all objects and folders from $bucket_name.\n";
} catch (Exception $exception) {
    echo "Failed to delete $file_name from $bucket_name with error: " . $exception-
>getMessage();
    exit("Please fix error with object deletion before continuing.");
}
```

- For API details, see [DeleteObjects](#) in *AWS SDK for PHP API Reference*.

## Get an object from a bucket

The following code example shows how to read data from an object in an S3 bucket.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Get an object.

```
$s3client = new Aws\S3\S3Client(['region' => 'us-west-2', 'version' => 'latest']);

try {
    $file = $s3client->getObject([
        'Bucket' => $bucket_name,
        'Key' => $file_name,
    ]);
    $body = $file->get('Body');
    $body->rewind();
    echo "Downloaded the file and it begins with: {$body->read(26)}.\n";
} catch (Exception $exception) {
    echo "Failed to download $file_name from $bucket_name with error: " . $exception-
>getMessage();
    exit("Please fix error with file downloading before continuing.");
}
```

- For API details, see [GetObject](#) in *AWS SDK for PHP API Reference*.

## List objects in a bucket

The following code example shows how to list objects in an S3 bucket.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

List objects in a bucket.

```
$s3client = new Aws\S3\S3Client(['region' => 'us-west-2', 'version' => 'latest']);
```

```
try {
    $contents = $s3client->listObjects([
        'Bucket' => $bucket_name,
    ]);
    echo "The contents of your bucket are: \n";
    foreach ($contents['Contents'] as $content) {
        echo $content['Key'] . "\n";
    }
} catch (Exception $exception) {
    echo "Failed to list objects in $bucket_name with error: " . $exception-
>getMessage();
    exit("Please fix error with listing objects before continuing.");
}
```

- For API details, see [ListObjects](#) in *AWS SDK for PHP API Reference*.

## Upload an object to a bucket

The following code example shows how to upload an object to an S3 bucket.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Upload an object to a bucket.

```
$s3client = new Aws\S3\S3Client(['region' => 'us-west-2', 'version' => 'latest']);

$file_name = "local-file-" . uniqid();
try {
    $s3client->putObject([
        'Bucket' => $bucket_name,
        'Key' => $file_name,
        'SourceFile' => 'testfile.txt'
    ]);
    echo "Uploaded $file_name to $bucket_name.\n";
} catch (Exception $exception) {
    echo "Failed to upload $file_name with error: " . $exception->getMessage();
    exit("Please fix error with file upload before continuing.");
}
```

- For API details, see [PutObject](#) in *AWS SDK for PHP API Reference*.

## Scenarios

### Get started with buckets and objects

The following code example shows how to:

- Create a bucket.
- Upload a file to the bucket.
- Download an object from a bucket.
- Copy an object to a subfolder in a bucket.
- List the objects in a bucket.
- Delete the objects in a bucket.

- Delete a bucket.

## SDK for PHP

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
require 'vendor/autoload.php';

use Aws\S3\S3Client;

echo("-----\n");
print("Welcome to the Amazon S3 getting started demo using PHP!\n");
echo("-----\n");

$region = 'us-west-2';
$version = 'latest';

$s3client = new S3Client([
    'region' => $region,
    'version' => $version
]);
/* Inline declaration example
$s3client = new Aws\S3\S3Client(['region' => 'us-west-2', 'version' => 'latest']);
*/

$bucket_name = "doc-example-bucket-" . uniqid();

try {
    $s3client->createBucket([
        'Bucket' => $bucket_name,
        'CreateBucketConfiguration' => ['LocationConstraint' => $region],
    ]);
    echo "Created bucket named: $bucket_name \n";

## Amazon SNS examples using SDK for PHP

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for PHP with Amazon Simple Notification Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3724\)](#)

## Actions

### Check whether a phone number is opted out

The following code example shows how to check whether a phone number is opted out of receiving Amazon SNS messages.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
require 'vendor/autoload.php';

use Aws\Sns\SnsClient;
use Aws\Exception\AwsException;

/**
 * Indicates whether the phone number owner has opted out of receiving SMS messages
 * from your AWS SNS account.
 *
 * This code expects that you have AWS credentials set up per:
 * https://docs.aws.amazon.com/sdk-for-php/v3/developer-guide/guide_credentials.html
 */

$SnsClient = new SnsClient([
    'profile' => 'default',
```

```
        'region' => 'us-east-1',
        'version' => '2010-03-31'
    ]);

$phone = '+1XXX5550100';

try {
    $result = $SnSclient->checkIfPhoneNumberIsOptedOut([
        'phoneNumber' => $phone,
    ]);
    var_dump($result);
} catch (AwsException $e) {
    // output error message if fails
    error_log($e->getMessage());
}
```

- For more information, see [AWS SDK for PHP Developer Guide](#).
- For API details, see [CheckIfPhoneNumberIsOptedOut](#) in [AWS SDK for PHP API Reference](#).

### Confirm an endpoint owner wants to receive messages

The following code example shows how to confirm the owner of an endpoint wants to receive Amazon SNS messages by validating the token sent to the endpoint by an earlier Subscribe action.

#### SDK for PHP

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
require 'vendor/autoload.php';

use Aws\Sns\SnsClient;
use Aws\Exception\AwsException;

/**
 * Verifies an endpoint owner's intent to receive messages by validating the token sent
 * to the endpoint by an earlier Subscribe action.
 *
 * This code expects that you have AWS credentials set up per:
 * https://docs.aws.amazon.com/sdk-for-php/v3/developer-guide/guide_credentials.html
 */

$SnSclient = new SnsClient([
    'profile' => 'default',
    'region' => 'us-east-1',
    'version' => '2010-03-31'
]);

$subscription_token = 'arn:aws:sns:us-east-1:111122223333:MyTopic:123456-
abcd-12ab-1234-12ba3dc1234a';
$topic = 'arn:aws:sns:us-east-1:111122223333:MyTopic';

try {
    $result = $SnSclient->confirmSubscription([
        'Token' => $subscription_token,
        'TopicArn' => $topic,
    ]);
    var_dump($result);
} catch (AwsException $e) {
```

```
// output error message if fails
error_log($e->getMessage());
}
```

- For API details, see [ConfirmSubscription](#) in *AWS SDK for PHP API Reference*.

## Create a topic

The following code example shows how to create an Amazon SNS topic.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
require 'vendor/autoload.php';

use Aws\Sns\SnsClient;
use Aws\Exception\AwsException;

/**
 * Create a Simple Notification Service topics in your AWS account at the requested
region.
*
* This code expects that you have AWS credentials set up per:
* https://docs.aws.amazon.com/sdk-for-php/v3/developer-guide/guide_credentials.html
*/
$SnsClient = new SnsClient([
    'profile' => 'default',
    'region' => 'us-east-1',
    'version' => '2010-03-31'
]);
$topicname = 'myTopic';

try {
    $result = $SnsClient->createTopic([
        'Name' => $topicname,
    ]);
    var_dump($result);
} catch (AwsException $e) {
    // output error message if fails
    error_log($e->getMessage());
}
```

- For more information, see [AWS SDK for PHP Developer Guide](#).
- For API details, see [CreateTopic](#) in *AWS SDK for PHP API Reference*.

## Delete a subscription

The following code example shows how to delete an Amazon SNS subscription.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
require 'vendor/autoload.php';

use Aws\Sns\SnsClient;
use Aws\Exception\AwsException;

/**
 * Deletes a subscription to an Amazon SNS topic.
 *
 * This code expects that you have AWS credentials set up per:
 * https://docs.aws.amazon.com/sdk-for-php/v3/developer-guide/guide_credentials.html
 */

$SnSclient = new SnsClient([
    'profile' => 'default',
    'region' => 'us-east-1',
    'version' => '2010-03-31'
]);

$subscription = 'arn:aws:sns:us-east-1:111122223333:MySubscription';

try {
    $result = $SnSclient->unsubscribe([
        'SubscriptionArn' => $subscription,
    ]);
    var_dump($result);
} catch (AwsException $e) {
    // output error message if fails
    error_log($e->getMessage());
}
```

- For more information, see [AWS SDK for PHP Developer Guide](#).
- For API details, see [Unsubscribe](#) in [AWS SDK for PHP API Reference](#).

## Delete a topic

The following code example shows how to delete an Amazon SNS topic and all subscriptions to that topic.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
require 'vendor/autoload.php';

use Aws\Sns\SnsClient;
use Aws\Exception\AwsException;

/**
 * Deletes a SNS topic and all its subscriptions.
 *
 * This code expects that you have AWS credentials set up per:
 * https://docs.aws.amazon.com/sdk-for-php/v3/developer-guide/guide_credentials.html
 */

$SnSclient = new SnsClient([
    'profile' => 'default',
    'region' => 'us-east-1',
    'version' => '2010-03-31'
```

```
]);
$topic = 'arn:aws:sns:us-east-1:111122223333:MyTopic';

try {
    $result = $SnSclient->deleteTopic([
        'TopicArn' => $topic,
    ]);
    var_dump($result);
} catch (AwsException $e) {
    // output error message if fails
    error_log($e->getMessage());
}
```

- For API details, see [DeleteTopic](#) in *AWS SDK for PHP API Reference*.

## Get the properties of a topic

The following code example shows how to get the properties of an Amazon SNS topic.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$SnSclient = new SnsClient([
    'profile' => 'default',
    'region' => 'us-east-1',
    'version' => '2010-03-31'
]);

$topic = 'arn:aws:sns:us-east-1:111122223333:MyTopic';

try {
    $result = $SnSclient->getTopicAttributes([
        'TopicArn' => $topic,
    ]);
    var_dump($result);
} catch (AwsException $e) {
    // output error message if fails
    error_log($e->getMessage());
}
```

- For API details, see [GetTopicAttributes](#) in *AWS SDK for PHP API Reference*.

## Get the settings for sending SMS messages

The following code example shows how to get the settings for sending Amazon SNS SMS messages.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
require 'vendor/autoload.php';
```

```
use Aws\Sns\SnsClient;
use Aws\Exception\AwsException;

/**
 * Get the type of SMS Message sent by default from the AWS SNS service.
 *
 * This code expects that you have AWS credentials set up per:
 * https://docs.aws.amazon.com/sdk-for-php/v3/developer-guide/guide_credentials.html
 */

$SnSclient = new SnsClient([
    'profile' => 'default',
    'region' => 'us-east-1',
    'version' => '2010-03-31'
]);

try {
    $result = $SnSclient->getSMSAttributes([
        'attributes' => ['DefaultSMSType'],
    ]);
    var_dump($result);
} catch (AwsException $e) {
    // output error message if fails
    error_log($e->getMessage());
}
```

- For more information, see [AWS SDK for PHP Developer Guide](#).
- For API details, see [GetSMSAttributes](#) in [AWS SDK for PHP API Reference](#).

## List opted out phone numbers

The following code example shows how to list phone numbers that are opted out of receiving Amazon SNS messages.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
require 'vendor/autoload.php';

use Aws\Sns\SnsClient;
use Aws\Exception\AwsException;

/**
 * Returns a list of phone numbers that are opted out of receiving SMS messages from
 * your AWS SNS account.
 *
 * This code expects that you have AWS credentials set up per:
 * https://docs.aws.amazon.com/sdk-for-php/v3/developer-guide/guide_credentials.html
 */

$SnSclient = new SnsClient([
    'profile' => 'default',
    'region' => 'us-east-1',
    'version' => '2010-03-31'
]);

try {
    $result = $SnSclient->listPhoneNumbersOptedOut([
```

```
]);
var_dump($result);
} catch (AwsException $e) {
    // output error message if fails
    error_log($e->getMessage());
}
```

- For more information, see [AWS SDK for PHP Developer Guide](#).
- For API details, see [ListPhoneNumbersOptedOut](#) in [AWS SDK for PHP API Reference](#).

## List the subscribers of a topic

The following code example shows how to retrieve the list of subscribers of an Amazon SNS topic.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
require 'vendor/autoload.php';

use Aws\Sns\SnsClient;
use Aws\Exception\AwsException;

/**
 * Returns a list of Amazon SNS subscriptions in the requested region.
 *
 * This code expects that you have AWS credentials set up per:
 * https://docs.aws.amazon.com/sdk-for-php/v3/developer-guide/guide_credentials.html
 */

$SnSclient = new SnsClient([
    'profile' => 'default',
    'region' => 'us-east-1',
    'version' => '2010-03-31'
]);

try {
    $result = $SnSclient->listSubscriptions([
    ]);
    var_dump($result);
} catch (AwsException $e) {
    // output error message if fails
    error_log($e->getMessage());
}
```

- For API details, see [ListSubscriptions](#) in [AWS SDK for PHP API Reference](#).

## List topics

The following code example shows how to list Amazon SNS topics.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
require 'vendor/autoload.php';

use Aws\Sns\SnsClient;
use Aws\Exception\AwsException;

/**
 * Returns a list of the requester's topics from your AWS SNS account in the region
 * specified.
 *
 * This code expects that you have AWS credentials set up per:
 * https://docs.aws.amazon.com/sdk-for-php/v3/developer-guide/guide_credentials.html
 */

$SnSclient = new SnsClient([
    'profile' => 'default',
    'region' => 'us-east-1',
    'version' => '2010-03-31'
]);

try {
    $result = $SnSclient->listTopics([
        []
    ]);
    var_dump($result);
} catch (AwsException $e) {
    // output error message if fails
    error_log($e->getMessage());
}
```

- For API details, see [ListTopics](#) in *AWS SDK for PHP API Reference*.

## Publish an SMS text message

The following code example shows how to publish SMS messages using Amazon SNS.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
require 'vendor/autoload.php';

use Aws\Sns\SnsClient;
use Aws\Exception\AwsException;

/**
 * Sends a a text message (SMS message) directly to a phone number using Amazon SNS.
 *
 * This code expects that you have AWS credentials set up per:
 * https://docs.aws.amazon.com/sdk-for-php/v3/developer-guide/guide_credentials.html
 */

$SnSclient = new SnsClient([
    'profile' => 'default',
    'region' => 'us-east-1',
    'version' => '2010-03-31'
]);

$message = 'This message is sent from a Amazon SNS code sample.';
$phone = '+1XXX5550100';
```

```
try {
    $result = $SnSclient->publish([
        'Message' => $message,
        'PhoneNumber' => $phone,
    ]);
    var_dump($result);
} catch (AwsException $e) {
    // output error message if fails
    error_log($e->getMessage());
}
```

- For more information, see [AWS SDK for PHP Developer Guide](#).
- For API details, see [Publish](#) in [AWS SDK for PHP API Reference](#).

## Publish to a topic

The following code example shows how to publish messages to an Amazon SNS topic.

### SDK for PHP

#### Note

```
require 'vendor/autoload.php';

use Aws\Sns\SnsClient;
use Aws\Exception\AwsException;

/**
 * Sends a message to an Amazon SNS topic.
 *
 * This code expects that you have AWS credentials set up per:
 * https://docs.aws.amazon.com/sdk-for-php/v3/developer-guide/guide_credentials.html
 */

$SnSclient = new SnsClient([
    'profile' => 'default',
    'region' => 'us-east-1',
    'version' => '2010-03-31'
]);

$message = 'This message is sent from a Amazon SNS code sample.';
$topic = 'arn:aws:sns:us-east-1:111122223333:MyTopic';

try {
    $result = $SnSclient->publish([
        'Message' => $message,
        'TopicArn' => $topic,
    ]);
    var_dump($result);
} catch (AwsException $e) {
    // output error message if fails
    error_log($e->getMessage());
}
```

- For more information, see [AWS SDK for PHP Developer Guide](#).
- For API details, see [Publish](#) in [AWS SDK for PHP API Reference](#).

## Set the default settings for sending SMS messages

The following code example shows how to set the default settings for sending SMS messages using Amazon SNS.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
$SnsClient = new SnsClient([
    'profile' => 'default',
    'region' => 'us-east-1',
    'version' => '2010-03-31'
]);

try {
    $result = $SnsClient->SetSMSAttributes([
        'attributes' => [
            'DefaultSMSType' => 'Transactional',
        ],
    ]);
    var_dump($result);
} catch (AwsException $e) {
    // output error message if fails
    error_log($e->getMessage());
}
```

- For API details, see [SetSmsAttributes](#) in [AWS SDK for PHP API Reference](#).

## Set topic attributes

The following code example shows how to set Amazon SNS topic attributes.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
require 'vendor/autoload.php';

use Aws\Sns\SnsClient;
use Aws\Exception\AwsException;

/**
 * Configure the message delivery status attributes for an Amazon SNS Topic.
 *
 * This code expects that you have AWS credentials set up per:
 * https://docs.aws.amazon.com/sdk-for-php/v3/developer-guide/guide_credentials.html
 */

$SnsClient = new SnsClient([
    'profile' => 'default',
    'region' => 'us-east-1',
```

```
        'version' => '2010-03-31'
]);
$attribute = 'Policy | DisplayName | DeliveryPolicy';
$value = 'First Topic';
$topic = 'arn:aws:sns:us-east-1:111122223333:MyTopic';

try {
    $result = $SnSClient->setTopicAttributes([
        'AttributeName' => $attribute,
        'AttributeValue' => $value,
        'TopicArn' => $topic,
    ]);
    var_dump($result);
} catch (AwsException $e) {
    // output error message if fails
    error_log($e->getMessage());
}
```

- For API details, see [SetTopicAttributes](#) in *AWS SDK for PHP API Reference*.

## Subscribe an HTTP endpoint to a topic

The following code example shows how to subscribe an HTTP or HTTPS endpoint so it receives notifications from an Amazon SNS topic.

### SDK for PHP

#### Note

There's more on [GitHub](#). Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
require 'vendor/autoload.php';

use Aws\Sns\SnsClient;
use Aws\Exception\AwsException;

/**
 * Prepares to subscribe an endpoint by sending the endpoint a confirmation message.
 *
 * This code expects that you have AWS credentials set up per:
 * https://docs.aws.amazon.com/sdk-for-php/v3/developer-guide/guide_credentials.html
 */

$SnSClient = new SnsClient([
    'profile' => 'default',
    'region' => 'us-east-1',
    'version' => '2010-03-31'
]);

$protocol = 'https';
$endpoint = 'https://';
$topic = 'arn:aws:sns:us-east-1:111122223333:MyTopic';

try {
    $result = $SnSClient->subscribe([
        'Protocol' => $protocol,
        'Endpoint' => $endpoint,
        'ReturnSubscriptionArn' => true,
        'TopicArn' => $topic,
    ]);
    var_dump($result);
}
```

```
    } catch (AwsException $e) {
        // output error message if fails
        error_log($e->getMessage());
    }
}
```

- For API details, see [Subscribe](#) in *AWS SDK for PHP API Reference*.

## Subscribe an email address to a topic

The following code example shows how to subscribe an email address to an Amazon SNS topic.

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
require 'vendor/autoload.php';

use Aws\Sns\SnsClient;
use Aws\Exception\AwsException;

/**
 * Prepares to subscribe an endpoint by sending the endpoint a confirmation message.
 *
 * This code expects that you have AWS credentials set up per:
 * https://docs.aws.amazon.com/sdk-for-php/v3/developer-guide/guide_credentials.html
 */

$SnSclient = new SnsClient([
    'profile' => 'default',
    'region' => 'us-east-1',
    'version' => '2010-03-31'
]);

$protocol = 'email';
$endpoint = 'sample@example.com';
$topic = 'arn:aws:sns:us-east-1:111122223333:MyTopic';

try {
    $result = $SnSclient->subscribe([
        'Protocol' => $protocol,
        'Endpoint' => $endpoint,
        'ReturnSubscriptionArn' => true,
        'TopicArn' => $topic,
    ]);
    var_dump($result);
} catch (AwsException $e) {
    // output error message if fails
    error_log($e->getMessage());
}
```

- For API details, see [Subscribe](#) in *AWS SDK for PHP API Reference*.

## Cross-service examples using SDK for PHP

The following sample applications use the AWS SDK for PHP to work across multiple AWS services.

### Examples

- [Create an Aurora Serverless work item tracker \(p. 3736\)](#)

## Create an Aurora Serverless work item tracker

### SDK for PHP

Shows how to use the AWS SDK for PHP to create a web application that tracks work items in an Amazon RDS database and emails reports by using Amazon Simple Email Service (Amazon SES). This example uses a front end built with React.js to interact with a RESTful PHP backend.

- Integrate a React.js web application with AWS services.
- List, add, update, and delete items in an Amazon RDS table.
- Send an email report of filtered work items using Amazon SES.
- Deploy and manage example resources with the included AWS CloudFormation script.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

## Code examples for SDK for Python (Boto3)

The code examples in this topic show you how to use the AWS SDK for Python (Boto3) with AWS.

### Examples

- [Single-service actions and scenarios using SDK for Python \(Boto3\) \(p. 3736\)](#)
- [Cross-service examples using SDK for Python \(Boto3\) \(p. 4304\)](#)

## Single-service actions and scenarios using SDK for Python (Boto3)

The following code examples show how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with AWS services.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Services

- [ACM examples using SDK for Python \(Boto3\) \(p. 3737\)](#)
- [API Gateway examples using SDK for Python \(Boto3\) \(p. 3751\)](#)

## ACM examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with AWS Certificate Manager.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3738\)](#)
- [Scenarios \(p. 3745\)](#)

## Actions

### Add tags to a certificate

The following code example shows how to add tags to ACM certificates.

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class AcmCertificate:  
    """  
        Encapsulates ACM functions.  
    """  
    def __init__(self, acm_client):  
        """  
            :param acm_client: A Boto3 ACM client.  
        """  
        self.acm_client = acm_client  
  
    def add_tags(self, certificate_arn, tags):  
        """  
            Adds tags to a certificate. Tags are key-value pairs that contain custom  
            metadata.  
            :param certificate_arn: The ARN of the certificate.  
            :param tags: A dictionary of key-value tags to add to the certificate.  
        """  
        try:  
            self.acm_client.add_tags_to_certificate(  
                CertificateArn=certificate_arn,  
                Tags=[{'Key': key, 'Value': value} for key, value in tags.items()])  
            logger.info("Added %s tags to certificate %s.", len(tags), certificate_arn)  
        except ClientError:  
            logger.exception("Couldn't add tags to certificate %s.", certificate_arn)  
        raise
```

- For API details, see [AddTagsToCertificate](#) in *AWS SDK for Python (Boto3) API Reference*.

### Delete a certificate

The following code example shows how to delete ACM certificates.

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class AcmCertificate:  
    """  
    Encapsulates ACM functions.  
    """  
    def __init__(self, acm_client):  
        """  
        :param acm_client: A Boto3 ACM client.  
        """  
        self.acm_client = acm_client  
  
    def remove(self, certificate_arn):  
        """  
        Removes a certificate.  
  
        :param certificate_arn: The ARN of the certificate to remove.  
        """  
        try:  
            self.acm_client.delete_certificate(CertificateArn=certificate_arn)  
            logger.info("Removed certificate %s.", certificate_arn)  
        except ClientError:  
            logger.exception("Couldn't remove certificate %s.", certificate_arn)  
            raise
```

- For API details, see [DeleteCertificate](#) in *AWS SDK for Python (Boto3) API Reference*.

## Describe a certificate

The following code example shows how to describe ACM certificates.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class AcmCertificate:  
    """  
    Encapsulates ACM functions.  
    """  
    def __init__(self, acm_client):  
        """  
        :param acm_client: A Boto3 ACM client.  
        """  
        self.acm_client = acm_client  
  
    def describe(self, certificate_arn):  
        """  
        Gets certificate metadata.  
  
        :param certificate_arn: The Amazon Resource Name (ARN) of the certificate.  
        :return: Metadata about the certificate.  
        """  
        try:  
            response = self.acm_client.describe_certificate(  
                CertificateArn=certificate_arn)  
            certificate = response['Certificate']  
            logger.info(  
                "Got metadata for certificate for domain %s.",
```

```
        certificate['DomainName'])
    except ClientError:
        logger.exception("Couldn't get data for certificate %s.", certificate_arn)
        raise
    else:
        return certificate
```

- For API details, see [DescribeCertificate](#) in *AWS SDK for Python (Boto3) API Reference*.

## Get a certificate

The following code example shows how to get ACM certificates.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class AcmCertificate:
    """
    Encapsulates ACM functions.
    """
    def __init__(self, acm_client):
        """
        :param acm_client: A Boto3 ACM client.
        """
        self.acm_client = acm_client

    def get(self, certificate_arn):
        """
        Gets the body and certificate chain of a certificate.

        :param certificate_arn: The ARN of the certificate.
        :return: The body and chain of a certificate.
        """
        try:
            response = self.acm_client.get_certificate(CertificateArn=certificate_arn)
            logger.info("Got certificate %s and its chain.", certificate_arn)
        except ClientError:
            logger.exception("Couldn't get certificate %s.", certificate_arn)
            raise
        else:
            return response
```

- For API details, see [GetCertificate](#) in *AWS SDK for Python (Boto3) API Reference*.

## Import certificates

The following code example shows how to import ACM certificates.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class AcmCertificate:  
    """  
    Encapsulates ACM functions.  
    """  
    def __init__(self, acm_client):  
        """  
        :param acm_client: A Boto3 ACM client.  
        """  
        self.acm_client = acm_client  
  
    def import_certificate(self, certificate_body, private_key):  
        """  
        Imports a self-signed certificate to ACM.  
  
        :param certificate_body: The body of the certificate, in PEM format.  
        :param private_key: The unencrypted private key of the certificate, in PEM  
                           format.  
        :return: The ARN of the imported certificate.  
        """  
        try:  
            response = self.acm_client.import_certificate(  
                Certificate=certificate_body, PrivateKey=private_key)  
            certificate_arn = response['CertificateArn']  
            logger.info("Imported certificate.")  
        except ClientError:  
            logger.exception("Couldn't import certificate.")  
            raise  
        else:  
            return certificate_arn
```

- For API details, see [ImportCertificate](#) in *AWS SDK for Python (Boto3) API Reference*.

## List certificates

The following code example shows how to list ACM certificates.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class AcmCertificate:  
    """  
    Encapsulates ACM functions.  
    """  
    def __init__(self, acm_client):  
        """  
        :param acm_client: A Boto3 ACM client.  
        """  
        self.acm_client = acm_client

## Scenarios

### Manage certificates

The following code example shows how to:

- Request a certificate from ACM.
- Import a self-signed certificate.

- List and describe certificates.
- Remove certificates.

## SDK for Python (Boto3)

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a class that wraps ACM operations.

```
import logging
from pprint import pprint

import boto3
from botocore.exceptions import ClientError

logger = logging.getLogger(__name__)

class AcmCertificate:
    """
    Encapsulates ACM functions.
    """
    def __init__(self, acm_client):
        """
        :param acm_client: A Boto3 ACM client.
        """
        self.acm_client = acm_client

    def request_validation(
            self, domain, alternate_domains, method, validation_domains=None):
        """
        Starts a validation request that results in a new certificate being issued
        by ACM. DNS validation requires that you add CNAME records to your DNS
        provider. Email validation sends email to a list of email addresses that
        are associated with the domain.

        For more information, see _Issuing and managing certificates_ in the ACM
        user guide.
        https://docs.aws.amazon.com/acm/latest/userguide/gs.html

        :param domain: The primary domain to associate with the certificate.
        :param alternate_domains: Subject Alternative Names (SANs) for the certificate.
        :param method: The validation method, either DNS or EMAIL.
        :param validation_domains: Alternate domains to use for email validation, when
                                   the email domain differs from the primary domain of
                                   the certificate.
        :return: The ARN of the requested certificate.
        """

## API Gateway examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with Amazon API Gateway.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3751\)](#)
- [Scenarios \(p. 3762\)](#)

## Actions

### Add a response from an AWS service integrated with a method

The following code example shows how to add a response from an AWS service integrated with an API Gateway method.

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class ApiGatewayToService:  
    """  
        Encapsulates Amazon API Gateway functions that are used to create a REST API that  
        integrates with another AWS service.  
    """  
    def __init__(self, apig_client):

## Scenarios

### Create and deploy a REST API

The following code example shows how to:

- Create a REST API served by API Gateway.
- Add resources to the REST API to represent a user profile.
- Add integration methods so that the REST API uses a DynamoDB table to store user profile data.
- Send HTTP requests to the REST API to add and retrieve user profiles.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a class that wraps API Gateway operations.

```

## Aurora examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with Amazon Aurora.

**Actions** are code excerpts that show you how to call individual service functions.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3775\)](#)
- [Scenarios \(p. 3788\)](#)

## Actions

### Create a DB cluster

The following code example shows how to create an Aurora DB cluster.

#### SDK for Python (Boto3)

##### Note

## Update parameters in a DB cluster parameter group

The following code example shows how to update parameters in an Aurora DB cluster parameter group.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class AuroraWrapper:  
    """Encapsulates Aurora DB cluster actions."""  
    def __init__(self, rds_client):  
        """  
        :param rds_client: A Boto3 Amazon Relational Database Service (Amazon RDS)  
        client.  
        """

## Scenarios

### Get started with DB clusters

The following code example shows how to:

- Create a custom Aurora DB cluster parameter group and set parameter values.
- Create a DB cluster that is configured to use the parameter group.
- Create a DB instance in the DB cluster that contains a database.
- Take a snapshot of the DB cluster.
- Delete the instance, DB cluster, and parameter group.

## SDK for Python (Boto3)

## CloudFront examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with Amazon CloudFront.

**Actions** are code excerpts that show you how to call individual service functions.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

## Amazon Cognito Identity Provider examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with Amazon Cognito Identity Provider.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3813\)](#)
- [Scenarios \(p. 3826\)](#)

## Actions

### Confirm a user

The following code example shows how to confirm an Amazon Cognito user.

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class CognitoIdentityProviderWrapper:  
    """Encapsulates Amazon Cognito actions"""

## Scenarios

### Sign up a user with a user pool that requires MFA

The following code example shows how to:

- Sign up a user with a user name, password, and email address.
- Confirm the user from a code sent in email.
- Set up multi-factor authentication by associating an MFA application with the user.
- Sign in by using a password and an MFA code.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

In addition to the previously listed steps, this example also registers an MFA device to be tracked by Amazon Cognito and shows you how to sign in by using a password and information from the tracked device. This avoids the need to enter a new MFA code.

## Amazon Comprehend examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with Amazon Comprehend.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3829\)](#)
- [Scenarios \(p. 3840\)](#)

## Actions

### Create a document classifier

The following code example shows how to create an Amazon Comprehend document classifier.

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class ComprehendClassifier:  
    """Encapsulates an Amazon Comprehend custom classifier."""  
    def __init__(self, comprehend_client):  
        """  
        :param comprehend_client: A Boto3 Comprehend client.  
        """  
        self.comprehend_client = comprehend_client  
        self.classifier_arn = None

## Scenarios

### Detect document elements

The following code example shows how to:

- Detect languages in a document.
- Detect entities in a document.
- Detect key phrases in a document.
- Detect personally identifiable information (PII) in a document.
- Detect the sentiment of a document.
- Detect syntax elements in a document.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a class that wraps Amazon Comprehend actions.

```

## AWS Config examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with AWS Config.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3853\)](#)

## Actions

### Delete a rule

The following code example shows how to delete an AWS Config rule.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class ConfigWrapper:  
    """  
    Encapsulates AWS Config functions.  
    """  
    def __init__(self, config_client):  
        """  
        :param config_client: A Boto3 AWS Config client.  
        """  
        self.config_client = config_client  
  
    def delete_config_rule(self, rule_name):  
        """  
        Delete the specified rule.  
  
        :param rule_name: The name of the rule to delete.  
        """  
        try:  
            self.config_client.delete_config_rule(ConfigRuleName=rule_name)  
            logger.info("Deleted rule %s.", rule_name)  
        except ClientError:  
            logger.exception("Couldn't delete rule %s.", rule_name)  
            raise
```

## DynamoDB examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with Amazon DynamoDB.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3862\)](#)
- [Scenarios \(p. 3875\)](#)

## Actions

### Create a table

The following code example shows how to create a DynamoDB table.

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a table for storing movie data.

```
class Movies:  
    """Encapsulates an Amazon DynamoDB table of movie data."""  
    def __init__(self, dyn_resource):  
        """  
        :param dyn_resource: A Boto3 DynamoDB resource.  
        """  
        self.dyn_resource = dyn_resource  
        self.table = None  
  
    def create_table(self, table_name):  
        """  
        Creates an Amazon DynamoDB table that can be used to store movie data.  
        The table uses the release year of the movie as the partition key and the  
        title as the sort key.  
  
        :param table_name: The name of the table to create.  
        :return: The newly created table.  
        """  
        try:  
            self.table = self.dyn_resource.create_table(  
                TableName=table_name,  
                KeySchema=[  
                    {'AttributeName': 'year', 'KeyType': 'HASH'}, # Partition key  
                    {'AttributeName': 'title', 'KeyType': 'RANGE'} # Sort key  
                ],  
                AttributeDefinitions=[  
                    {'AttributeName': 'year', 'AttributeType': 'N'},  
                    {'AttributeName': 'title', 'AttributeType': 'S'}  
                ],  
                ProvisionedThroughput={'ReadCapacityUnits': 10, 'WriteCapacityUnits':  
10})  
            self.table.wait_until_exists()  
        except ClientError as err:  
            logger.error(
```

```
        "Couldn't create table %s. Here's why: %s: %s", table_name,
        err.response['Error']['Code'], err.response['Error']['Message'])
    raise
else:
    return self.table
```

- For API details, see [CreateTable](#) in *AWS SDK for Python (Boto3) API Reference*.

## Delete a table

The following code example shows how to delete a DynamoDB table.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class Movies:
    """Encapsulates an Amazon DynamoDB table of movie data."""
    def __init__(self, dyn_resource):
        """
        :param dyn_resource: A Boto3 DynamoDB resource.
        """
        self.dyn_resource = dyn_resource
        self.table = None

    def delete_table(self):
        """
        Deletes the table.
        """
        try:
            self.table.delete()
            self.table = None
        except ClientError as err:
            logger.error(
                "Couldn't delete table. Here's why: %s: %s",
                err.response['Error']['Code'], err.response['Error']['Message'])
            raise
```

- For API details, see [DeleteTable](#) in *AWS SDK for Python (Boto3) API Reference*.

## Delete an item from a table

The following code example shows how to delete an item from a DynamoDB table.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class Movies:
    """Encapsulates an Amazon DynamoDB table of movie data."""
    def __init__(self, dyn_resource):
        """
        :param dyn_resource: A Boto3 DynamoDB resource.
        """
```

```
    self.dyn_resource = dyn_resource
    self.table = None

    def delete_movie(self, title, year):
        """
        Deletes a movie from the table.

        :param title: The title of the movie to delete.
        :param year: The release year of the movie to delete.
        """
        try:
            self.table.delete_item(Key={'year': year, 'title': title})
        except ClientError as err:
            logger.error(
                "Couldn't delete movie %s. Here's why: %s: %s",
                title,
                err.response['Error']['Code'],
                err.response['Error']['Message']
            )
            raise
```

You can specify a condition so that an item is deleted only when it meets certain criteria.

```
class UpdateQueryWrapper:
    def __init__(self, table):
        self.table = table

    def delete_underrated_movie(self, title, year, rating):
        """
        Deletes a movie only if it is rated below a specified value. By using a
        condition expression in a delete operation, you can specify that an item is
        deleted only when it meets certain criteria.

        :param title: The title of the movie to delete.
        :param year: The release year of the movie to delete.
        :param rating: The rating threshold to check before deleting the movie.
        """
        try:
            self.table.delete_item(
                Key={'year': year, 'title': title},
                ConditionExpression="info.rating <= :val",

        "Couldn't load data into table %s. Here's why: %s: %s",
        self.table.name,
        err.response['Error']['Code'], err.response['Error']['Message'])
    raise
```

- For API details, see [BatchWriteItem in AWS SDK for Python \(Boto3\) API Reference](#).

## Scenarios

### Accelerate reads with DAX

The following code example shows how to:

- Create and write data to a table with both the DAX and SDK clients.
- Get, query, and scan the table with both the DAX and SDK clients and compare their performance.

For more information, see [Developing with the DynamoDB Accelerator Client](#).

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a table with either the DAX or Boto3 client.

```
import boto3

def create_dax_table(dyn_resource=None):
    """
    Creates a DynamoDB table.

    :param dyn_resource: Either a Boto3 or DAX resource.
    :return: The newly created table.
    """
    if dyn_resource is None:
        dyn_resource = boto3.resource('dynamodb')

    table_name = 'TryDaxTable'
    params = {
        'TableName': table_name,
        'KeySchema': [
            {'AttributeName': 'partition_key', 'KeyType': 'HASH'},
            {'AttributeName': 'sort_key', 'KeyType': 'RANGE'}
        ],
        'AttributeDefinitions': [
            {'AttributeName': 'partition_key', 'AttributeType': 'N'},
            {'AttributeName': 'sort_key', 'AttributeType': 'N'}
        ],
        'ProvisionedThroughput': {
            'ReadCapacityUnits': 10,
            'WriteCapacityUnits': 10
        }
    }
```

```
table = dyn_resource.create_table(**params)
print(f"Creating {table_name}...")
table.wait_until_exists()
return table

if __name__ == '__main__':
    dax_table = create_dax_table()
    print(f"Created table.")
```

Write test data to the table.

```
import boto3

def write_data_to_dax_table(key_count, item_size, dyn_resource=None):
    """
    Writes test data to the demonstration table.

    :param key_count: The number of partition and sort keys to use to populate the
                      table. The total number of items is key_count * key_count.
    :param item_size: The size of non-key data for each test item.
    :param dyn_resource: Either a Boto3 or DAX resource.
    """
    if dyn_resource is None:
        dyn_resource = boto3.resource('dynamodb')

    table = dyn_resource.Table('TryDaxTable')
    some_data = 'X' * item_size

    for partition_key in range(1, key_count + 1):
        for sort_key in range(1, key_count + 1):
            table.put_item(Item={
                'partition_key': partition_key,
                'sort_key': sort_key,
                'some_data': some_data
            })
    print(f"Put item ({partition_key}, {sort_key}) succeeded.")

if __name__ == '__main__':
    write_key_count = 10
    write_item_size = 1000
    print(f"Writing {write_key_count}*{write_key_count} items to the table. "
          f"Each item is {write_item_size} characters.")
    write_data_to_dax_table(write_key_count, write_item_size)
```

Get items for a number of iterations for both the DAX client and the Boto3 client and report the time spent for each.

```
import argparse
import sys
import time
import amazondax
import boto3

def get_item_test(key_count, iterations, dyn_resource=None):
    """
    Gets items from the table a specified number of times. The time before the
    first iteration and the time after the last iteration are both captured
    """
    pass
```

```

and reported.

:param key_count: The number of items to get from the table in each iteration.
:param iterations: The number of iterations to run.
:param dyn_resource: Either a Boto3 or DAX resource.

  - [DeleteTable](#)
  - [GetItem](#)
  - [PutItem](#)
  - [Query](#)
  - [Scan](#)

## Get started using tables, items, and queries

The following code example shows how to:

- Create a table that can hold movie data.
- Put, get, and update a single movie in the table.
- Write movie data to the table from a sample JSON file.
- Query for movies that were released in a given year.
- Scan for movies that were released in a range of years.
- Delete a movie from the table.
- Delete the table.

## SDK for Python (Boto3)

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

## Query a table by using batches of PartiQL statements

The following code example shows how to:

- Get a batch of items by running multiple SELECT statements.
- Add a batch of items by running multiple INSERT statements.
- Update a batch of items by running multiple UPDATE statements.
- Delete a batch of items by running multiple DELETE statements.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a class that can run batches of PartiQL statements.

```
from datetime import datetime
from decimal import Decimal
import logging
from pprint import pprint

import boto3
from botocore.exceptions import ClientError

from scaffold import Scaffold

logger = logging.getLogger(__name__)

class PartiQLBatchWrapper:
    """
    Encapsulates a DynamoDB resource to run PartiQL statements.
    """
    def __init__(self, dyn_resource):
        """
        :param dyn_resource: A Boto3 DynamoDB resource.
        """
        self.dyn_resource = dyn_resource

    def run_partiql(self, statements, param_list):
        """
        Runs a PartiQL statement. A Boto3 resource is used even though
        'execute_statement' is called on the underlying 'client' object because the
        resource transforms input and output from plain old Python objects (POPOs) to
        the DynamoDB format. If you create the client directly, you must do these
        """

```

```

transforms yourself.

:param statements: The batch of PartiQL statements.
:param param_list: The batch of PartiQL parameters that are associated with
                   each statement. This list must be in the same order as the
                   statements.
:return: The responses returned from running the statements, if any.
"""
try:
    output = self.dyn_resource.meta.client.batch_execute_statement(
        Statements=[{

## Amazon EC2 examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with Amazon Elastic Compute Cloud.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Get started

#### [Hello Amazon EC2](#)

The following code examples show how to get started using Amazon Elastic Compute Cloud (Amazon EC2).

Java

#### [SDK for Java 2.x](#)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void describeEC2SecurityGroups(Ec2Client ec2, String groupId) {
    try {
        DescribeSecurityGroupsRequest request =
            DescribeSecurityGroupsRequest.builder()
                .groupIds(groupId)
                .build();

        DescribeSecurityGroupsResponse response =
            ec2.describeSecurityGroups(request);
        for(SecurityGroup group : response.securityGroups()) {
            System.out.printf(
                "Found Security Group with id %s, " +
                "vpc id %s " +
                "and description %s",
                group.groupId(),
                group.vpcId(),
                group.description());
        }
    } catch (Ec2Exception e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [DescribeSecurityGroups](#) in *AWS SDK for Java 2.x API Reference*.

## Python

### SDK for Python (Boto3)

#### Note

## Scenarios

### Get started with instances

The following code example shows how to:

- Create a key pair that is used to secure SSH communication between your computer and an EC2 instance.
- Create a security group that acts as a virtual firewall for your EC2 instances to control incoming and outgoing traffic.
- Find an Amazon Machine Image (AMI) and a compatible instance type.
- Create an instance that is created from the instance type and AMI you select, and is configured to use the security group and key pair created in this example.

- Stop and restart the instance.
- Create an Elastic IP address and associate it as a consistent IP address for your instance.
- Connect to your instance with SSH, using both its public IP address and your Elastic IP address.
- Clean up all of the resources created by this example.

## SDK for Python (Boto3)

## Amazon EC2 Auto Scaling examples using SDK for Python (Boto3)

---

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with Amazon EC2 Auto Scaling.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3924\)](#)
- [Scenarios \(p. 3930\)](#)

## Actions

### Create a group

The following code example shows how to create an Auto Scaling group.

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class AutoScalingWrapper:  
    """Encapsulates Amazon EC2 Auto Scaling actions."""  
    def __init__(self, autoscaling_client):  
        """  
        :param autoscaling_client: A Boto3 Amazon EC2 Auto Scaling client.  
        """  
        self.autoscaling_client = autoscaling_client  
  
    def create_group(  
        self, group_name, group_zones, launch_template_name, min_size, max_size):  
        """  
        Creates an Auto Scaling group.  
  
        :param group_name: The name to give to the group.  
        :param group_zones: The Availability Zones in which instances can be created.  
        :param launch_template_name: The name of an existing Amazon EC2 launch  
        template.  
                    The launch template specifies the configuration of  
                    instances that are created by auto scaling  
        activities.  
        :param min_size: The minimum number of active instances in the group.  
        :param max_size: The maximum number of active instances in the group.  
        """  
        try:  
            self.autoscaling_client.create_auto_scaling_group(  
                AutoScalingGroupName=group_name,  
                AvailabilityZones=group_zones,  
                LaunchTemplate={  
                    'LaunchTemplateName': launch_template_name, 'Version': '$Default'},  
                MinSize=min_size, MaxSize=max_size  
            )  
        except ClientError as err:  
            logger.error(  
                "Couldn't create group %s. Here's why: %s: %s", group_name,  
                err.response['Error']['Code'], err.response['Error']['Message'])  
            raise
```

- For API details, see [CreateAutoScalingGroup](#) in *AWS SDK for Python (Boto3) API Reference*.

## Delete a group

The following code example shows how to delete an Auto Scaling group.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class AutoScalingWrapper:  
    """Encapsulates Amazon EC2 Auto Scaling actions."""  
    def __init__(self, autoscaling_client):  
        """  
        :param autoscaling_client: A Boto3 Amazon EC2 Auto Scaling client.  
        """  
        self.autoscaling_client = autoscaling_client  
  
    def delete_group(self, group_name):  
        """  
        Deletes an Auto Scaling group. All instances must be stopped before the  
        group can be deleted.  
  
        :param group_name: The name of the group to delete.  
        """  
        try:  
            self.autoscaling_client.delete_auto_scaling_group(  
                AutoScalingGroupName=group_name)  
        except ClientError as err:  
            logger.error(  
                "Couldn't delete group %s. Here's why: %s: %s", group_name,  
                err.response['Error']['Code'], err.response['Error']['Message'])  
            raise
```

- For API details, see [DeleteAutoScalingGroup](#) in *AWS SDK for Python (Boto3) API Reference*.

## Disable metrics collection for a group

The following code example shows how to disable CloudWatch metrics collection for an Auto Scaling group.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class AutoScalingWrapper:  
    """Encapsulates Amazon EC2 Auto Scaling actions."""  
    def __init__(self, autoscaling_client):  
        """  
        :param autoscaling_client: A Boto3 Amazon EC2 Auto Scaling client.

                err.response['Error']['Code'],
                err.response['Error']['Message'])
            raise
```

- For API details, see [UpdateAutoScalingGroup](#) in *AWS SDK for Python (Boto3) API Reference*.

## Scenarios

### Manage groups and instances

The following code example shows how to:

- Create an Amazon EC2 Auto Scaling group and configure it with a launch template and Availability Zones.

- Get information about the group and running instances.
- Enable Amazon CloudWatch metrics collection on the group.
- Update the desired capacity of the group and wait for an instance to start.
- Terminate an instance in the group.
- List scaling activities that occur in response to user requests and capacity changes.
- Get statistics for CloudWatch metrics that are collected during the example.
- Stop collecting metrics, terminate all instances, and delete the group.

## SDK for Python (Boto3)

### Note

## Amazon EMR examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with Amazon EMR.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3937\)](#)
- [Scenarios \(p. 3942\)](#)

## Actions

### Add steps to a job flow

The following code example shows how to add steps to an Amazon EMR job flow.

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Add a Spark step, which is run by the cluster as soon as it is added.

```
def add_step(cluster_id, name, script_uri, script_args, emr_client):
    """
    Adds a job step to the specified cluster. This example adds a Spark
    step, which is run by the cluster as soon as it is added.

    :param cluster_id: The ID of the cluster.
    :param name: The name of the step.
    :param script_uri: The URI where the Python script is stored.
    :param script_args: Arguments to pass to the Python script.
    :param emr_client: The Boto3 EMR client object.
    :return: The ID of the newly added step.
    """
    try:
        response = emr_client.add_job_flow_steps(
            JobFlowId=cluster_id,
            Steps=[{
                'Name': name,

        response = emr_client.list_steps(ClusterId=cluster_id)
        steps = response['Steps']
        logger.info("Got %s steps for cluster %s.", len(steps), cluster_id)
    except ClientError:
        logger.exception("Couldn't get steps for cluster %s.", cluster_id)
        raise
    else:
        return steps
```

- For API details, see [ListSteps in AWS SDK for Python \(Boto3\) API Reference](#).

## Run a job flow

The following code example shows how to run an Amazon EMR job flow.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
def run_job_flow(
    name, log_uri, keep_alive, applications, job_flow_role, service_role,
    security_groups, steps, emr_client):
    """
    Runs a job flow with the specified steps. A job flow creates a cluster of
    instances and adds steps to be run on the cluster. Steps added to the cluster
    are run as soon as the cluster is ready.

    This example uses the 'emr-5.30.1' release. A list of recent releases can be
    found here:
        https://docs.aws.amazon.com/emr/latest/ReleaseGuide/emr-release-
    components.html.

    :param name: The name of the cluster.
    :param log_uri: The URI where logs are stored. This can be an Amazon S3 bucket URL,
        such as 's3://my-log-bucket'.
    :param keep_alive: When True, the cluster is put into a Waiting state after all
```

```

        steps are run. When False, the cluster terminates itself when
        the step queue is empty.
:param applications: The applications to install on each instance in the cluster,
                     such as Hive or Spark.
:param job_flow_role: The IAM role assumed by the cluster.
:param service_role: The IAM role assumed by the service.
:param security_groups: The security groups to assign to the cluster instances.
                        Amazon EMR adds all needed rules to these groups, so
                        they can be empty if you require only the default rules.
:param steps: The job flow steps to add to the cluster. These are run in order
              when the cluster is ready.
:param emr_client: The Boto3 EMR client object.
:returns: The ID of the newly created cluster.
"""

## Scenarios

### Run a shell script to install libraries on instances

The following code example shows how to use AWS Systems Manager to run a shell script on Amazon EMR instances to install additional libraries. This can be used to automate instance management instead of running commands manually through an SSH connection.

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
import argparse
import time
import boto3

def install_libraries_on_core_nodes(
    cluster_id, script_path, emr_client, ssm_client):
    """
    Copies and runs a shell script on the core nodes in the cluster.

    :param cluster_id: The ID of the cluster.
    :param script_path: The path to the script, typically an Amazon S3 object URL.
    :param emr_client: The Boto3 Amazon EMR client.
    :param ssm_client: The Boto3 AWS Systems Manager client.
    """
    core_nodes = emr_client.list_instances(
        ClusterId=cluster_id, InstanceGroupTypes=['CORE'])['Instances']
    core_instance_ids = [node['Ec2InstanceId'] for node in core_nodes]
    print(f"Found core instances: {core_instance_ids}.")

    commands = [
        # Copy the shell script from Amazon S3 to each node instance.
        f"aws s3 cp {script_path} /home/hadoop",
        # Run the shell script to install libraries on each node instance.
        "bash /home/hadoop/install_libraries.sh"]
    for command in commands:
        print(f"Sending '{command}' to core instances...")
        command_id = ssm_client.send_command(
```

```
InstanceIds=core_instance_ids,
DocumentName='AWS-RunShellScript',
Parameters={"commands": [command]},
TimeoutSeconds=3600)['Command']['CommandId']

## AWS Glue examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with AWS Glue.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3943\)](#)
- [Scenarios \(p. 3953\)](#)

## Actions

### Create a crawler

The following code example shows how to create an AWS Glue crawler.

## SDK for Python (Boto3)

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class GlueWrapper:
    """Encapsulates AWS Glue actions."""
    def __init__(self, glue_client):
        """
        :param glue_client: A Boto3 Glue client.
        """
        self.glue_client = glue_client

    def create_crawler(self, name, role_arn, db_name, db_prefix, s3_target):
        """
        Creates a crawler that can crawl the specified target and populate a
        database in your AWS Glue Data Catalog with metadata that describes the data
        in the target.

        :param name: The name of the crawler.
        :param role_arn: The Amazon Resource Name (ARN) of an AWS Identity and Access
                         Management (IAM) role that grants permission to let AWS Glue
                         access the resources it needs.
        :param db_name: The name to give the database that is created by the crawler.
        :param db_prefix: The prefix to give any database tables that are created by
                          the crawler.
        :param s3_target: The URL to an S3 bucket that contains data that is
                          the target of the crawler.
        """
        try:
            self.glue_client.create_crawler(
                Name=name,
                Role=role_arn,
                DatabaseName=db_name,
                TablePrefix=db_prefix,
                Targets={'S3Targets': [{'Path': s3_target}]})
        except ClientError as err:
            logger.error(
                "Couldn't create crawler. Here's why: %s: %s",
                err.response['Error']['Code'], err.response['Error']['Message'])
            raise
```

- For API details, see [CreateCrawler](#) in *AWS SDK for Python (Boto3) API Reference*.

## Create a job definition

The following code example shows how to create an AWS Glue job definition.

## SDK for Python (Boto3)

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class GlueWrapper:
    """Encapsulates AWS Glue actions."""
    def __init__(self, glue_client):

```

- For API details, see [StartJobRun](#) in *AWS SDK for Python (Boto3) API Reference*.

## Scenarios

### Get started running crawlers and jobs

The following code example shows how to:

- Create and run a crawler that crawls a public Amazon Simple Storage Service (Amazon S3) bucket and generates a metadata database that describes the CSV-formatted data it finds.
- List information about databases and tables in your AWS Glue Data Catalog.
- Create and run a job that extracts CSV data from the source Amazon S3 bucket, transforms it by removing and renaming fields, and loads JSON-formatted output into another Amazon S3 bucket.
- List information about job runs and view some of the transformed data.
- Delete all resources created by the demo.

For more information, see [Tutorial: Getting started with AWS Glue Studio](#).

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a class that wraps AWS Glue functions used in the scenario.

```
class GlueWrapper:

## IAM examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with AWS Identity and Access Management.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3963\)](#)
- [Scenarios \(p. 3982\)](#)

## Actions

### Attach a policy to a role

The following code example shows how to attach an IAM policy to a role.

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Attach a policy to a role using the Boto3 Policy object.

```
def attach_to_role(role_name, policy_arn):  
    """  
        Attaches a policy to a role.  
  
        :param role_name: The name of the role. **Note** this is the name, not the ARN.  
        :param policy_arn: The ARN of the policy.  
    """  
    try:  
        iam.Policy(policy_arn).attach_role(RoleName=role_name)  
        logger.info("Attached policy %s to role %s.", policy_arn, role_name)  
    except ClientError:  
        logger.exception("Couldn't attach policy %s to role %s.", policy_arn,  
                        role_name)
```

```
raise
```

Attach a policy to a role using the Boto3 Role object.

```
def attach_policy(role_name, policy_arn):
    """
    Attaches a policy to a role.

    :param role_name: The name of the role. **Note** this is the name, not the ARN.
    :param policy_arn: The ARN of the policy.
    """
    try:
        iam.Role(role_name).attach_policy(PolicyArn=policy_arn)
        logger.info("Attached policy %s to role %s.", policy_arn, role_name)
    except ClientError:
        logger.exception("Couldn't attach policy %s to role %s.", policy_arn,
                         role_name)
        raise
```

- For API details, see [AttachRolePolicy](#) in *AWS SDK for Python (Boto3) API Reference*.

## Attach a policy to a user

The following code example shows how to attach an IAM policy to a user.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
def attach_policy(user_name, policy_arn):
    """
    Attaches a policy to a user.

    :param user_name: The name of the user.
    :param policy_arn: The Amazon Resource Name (ARN) of the policy.
    """
    try:
        iam.User(user_name).attach_policy(PolicyArn=policy_arn)
        logger.info("Attached policy %s to user %s.", policy_arn, user_name)
    except ClientError:
        logger.exception("Couldn't attach policy %s to user %s.", policy_arn,
                         user_name)
        raise
```

    """
    Deletes a user. Before a user can be deleted, all associated resources,
    such as access keys and policies, must be deleted or detached.

    :param user_name: The name of the user.
    """
    try:
        iam.User(user_name).delete()
        logger.info("Deleted user %s.", user_name)
    except ClientError:
        logger.exception("Couldn't delete user %s.", user_name)
        raise
```

- For API details, see [DeleteUser](#) in *AWS SDK for Python (Boto3) API Reference*.

## Delete an access key

The following code example shows how to delete an IAM access key.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
def delete_key(user_name, key_id):
    """
    Deletes a user's access key.

    :param user_name: The user that owns the key.
    :param key_id: The ID of the key to delete.
    """

    try:
        key = iam.AccessKey(user_name, key_id)
        key.delete()
        logger.info(
            "Deleted access key %s for %s.", key.id, key.user_name)
    except ClientError:
        logger.exception("Couldn't delete key %s for %s", key_id, user_name)
        raise
```

- For API details, see [DeleteAccessKey](#) in *AWS SDK for Python (Boto3) API Reference*.

## Delete an account alias

The following code example shows how to delete an IAM account alias.

## SDK for Python (Boto3)

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
def delete_alias(alias):
    """
    Removes the alias from the current account.

    :param alias: The alias to remove.
    """
    try:
        iam.meta.client.delete_account_alias(AccountAlias=alias)
        logger.info("Removed alias '%s' from your account.", alias)
    except ClientError:
        logger.exception("Couldn't remove alias '%s' from your account.", alias)
        raise
```

- For API details, see [DeleteAccountAlias](#) in *AWS SDK for Python (Boto3) API Reference*.

## Detach a policy from a role

The following code example shows how to detach an IAM policy from a role.

## SDK for Python (Boto3)

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Detach a policy from a role using the Boto3 Policy object.

```
def detach_from_role(role_name, policy_arn):
    """
    Detaches a policy from a role.

    :param role_name: The name of the role. **Note** this is the name, not the ARN.
    :param policy_arn: The ARN of the policy.
    """
    try:
        iam.Policy(policy_arn).detach_role(RoleName=role_name)
        logger.info("Detached policy %s from role %s.", policy_arn, role_name)
    except ClientError:
        logger.exception(
            "Couldn't detach policy %s from role %s.", policy_arn, role_name)
        raise
```

Detach a policy from a role using the Boto3 Role object.

```
def detach_policy(role_name, policy_arn):
    """
    Detaches a policy from a role.

    :param role_name: The name of the role. **Note** this is the name, not the ARN.
    :param policy_arn: The ARN of the policy.
    """
    try:
        iam.Role(role_name).detach_policy(PolicyArn=policy_arn)
        logger.info("Detached policy %s from role %s.", policy_arn, role_name)
```

```
        except ClientError:
            logger.exception(

    except ClientError:
        logger.exception(
            "Couldn't detach policy %s from user %s.", policy_arn, user_name)
        raise
```

- For API details, see [DetachUserPolicy](#) in *AWS SDK for Python (Boto3) API Reference*.

## Generate a credential report

The following code example shows how to generate a credential report from IAM for the current account. After the report is generated, get it by using the GetCredentialReport action.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
def generate_credential_report():
    """
    Starts generation of a credentials report about the current account. After
    calling this function to generate the report, call get_credential_report
    to get the latest report. A new report can be generated a minimum of four hours
    after the last one was generated.
    """
    try:
        response = iam.meta.client.generate_credential_report()
        logger.info("Generating credentials report for your account. "
                   "Current state is %s.", response['State'])
    except ClientError:
        logger.exception("Couldn't generate a credentials report for your account.")
```

```
        raise
    else:
        return response
```

- For API details, see [GenerateCredentialReport in AWS SDK for Python \(Boto3\) API Reference](#).

## Get a credential report

The following code example shows how to get the most recently generated credential report from IAM.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
def get_credential_report():
    """
    Gets the most recently generated credentials report about the current account.

    :return: The credentials report.
    """
    try:
        response = iam.meta.client.get_credential_report()
        logger.debug(response['Content'])
    except ClientError:
        logger.exception("Couldn't get credentials report.")
        raise
    else:
        return response['Content']
```

- For API details, see [GetCredentialReport in AWS SDK for Python \(Boto3\) API Reference](#).

## Get a detailed authorization report for your account

The following code example shows how to get a detailed IAM authorization report for your account.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
def get_authorization_details(response_filter):
    """
    Gets an authorization detail report for the current account.

    :param response_filter: A list of resource types to include in the report, such
                           as users or roles. When not specified, all resources
                           are included.
    :return: The authorization detail report.
    """
    try:
        account_details = iam.meta.client.get_account_authorization_details(
            Filter=response_filter
        )
        logger.debug(account_details)
    except ClientError:
```

```
        logger.exception("Couldn't get details for your account.")
        raise
    else:

```

- For API details, see [GetAccountAuthorizationDetails](#) in *AWS SDK for Python (Boto3) API Reference*.

## Get a policy

The following code example shows how to get an IAM policy.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
def get_default_policy_statement(policy_arn):
    """
    Gets the statement of the default version of the specified policy.

    :param policy_arn: The ARN of the policy to look up.
    :return: The statement of the default policy version.
    """
    try:
        policy = iam.Policy(policy_arn)
        # To get an attribute of a policy, the SDK first calls get_policy.
        policy_doc = policy.default_version.document
        policy_statement = policy_doc.get('Statement', None)
        logger.info("Got default policy doc for %s.", policy.policy_name)
        logger.info(policy_doc)
    except ClientError:
        logger.exception("Couldn't get default policy statement for %s.", policy_arn)
        raise
    else:
        return policy_statement
```

- For API details, see [GetPolicy](#) in *AWS SDK for Python (Boto3) API Reference*.

## Get a policy version

The following code example shows how to get an IAM policy version.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
def get_default_policy_statement(policy_arn):
    """
    Gets the statement of the default version of the specified policy.

    :param policy_arn: The ARN of the policy to look up.
    :return: The statement of the default policy version.
    """
    try:
        policy = iam.Policy(policy_arn)
```

```
# To get an attribute of a policy, the SDK first calls get_policy.
policy_doc = policy.default_version.document
policy_statement = policy_doc.get('Statement', None)
logger.info("Got default policy doc for %s.", policy.policy_name)
logger.info(policy_doc)
except ClientError:
    logger.exception("Couldn't get default policy statement for %s.", policy_arn)
    raise
else:
    return policy_statement
```

- For API details, see [GetPolicyVersion](#) in *AWS SDK for Python (Boto3) API Reference*.

## Get a role

The following code example shows how to get an IAM role.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
def get_role(role_name):
    """
    Gets a role by name.

    :param role_name: The name of the role to retrieve.
    :return: The specified role.
    """
    try:
        role = iam.Role(role_name)
        role.load() # calls GetRole to load attributes
        logger.info("Got role with arn %s.", role.arn)
    except ClientError:
        logger.exception("Couldn't get role named %s.", role_name)
        raise
    else:
        return role
```

- For API details, see [GetRole](#) in *AWS SDK for Python (Boto3) API Reference*.

## Get a summary of account usage

The following code example shows how to get a summary of account usage from IAM.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
def get_summary():
    """
    Gets a summary of account usage.

    :return: The summary of account usage.
    """
```

```
try:
    summary = iam.AccountSummary()
    logger.debug(summary.summary_map)
except ClientError:
    logger.exception("Couldn't get a summary for your account.")
    raise
else:
    return summary.summary_map
```

- For API details, see [GetAccountSummary](#) in *AWS SDK for Python (Boto3) API Reference*.

## Get data about the last use of an access key

The following code example shows how to get data about the last use of an IAM access key.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
def get_last_use(key_id):
    """
    Gets information about when and how a key was last used.

    :param key_id: The ID of the key to look up.
    :return: Information about the key's last use.
    """
    try:
        response = iam.meta.client.get_access_key_last_used(AccessKeyId=key_id)

## Scenarios

### Create a user and assume a role

The following code example shows how to:

- Create a user who has no permissions.
- Create a role that grants permission to list Amazon S3 buckets for the account.
- Add a policy to let the user assume the role.

- Assume the role and list Amazon S3 buckets using temporary credentials.
- Delete the policy, role, and user.

## SDK for Python (Boto3)

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create an IAM user and a role that grants permission to list Amazon S3 buckets. The user has rights only to assume the role. After assuming the role, use temporary credentials to list buckets for the account.

```

## Create read-only and read-write users

The following code example shows how to:

- Create two IAM users.
- Attach a policy that lets one of the users get and put objects in an Amazon Simple Storage Service (Amazon S3) bucket.
- Attach a policy that lets the other user get objects from the bucket.
- Obtain differing permissions to the bucket based on user credentials.

## AWS KMS examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with AWS Key Management Service.

**Actions** are code excerpts that show you how to call individual service functions.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4006\)](#)
- [Scenarios \(p. 4020\)](#)

## Actions

### Create a grant for a key

The following code example shows how to create a grant for a KMS key.

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

This example grants permission to let a user generate a data key that can be used for encryption.

```
class GrantManager:
    def __init__(self, kms_client):
        self.kms_client = kms_client

    def create_grant(self, key_id):
        """
        Creates a grant for a key that lets a user generate a symmetric data
        encryption key.

        :param key_id: The ARN or ID of the key.
        :return: The grant that is created.
        """

        user = input(
            f"Enter the ARN of an IAM user to grant that user GenerateDataKey "
            f"permissions on key {key_id}.\n")
        if user != '':
            try:
                grant = self.kms_client.create_grant(
                    KeyId=key_id, GranteePrincipal=user,
                    Operations=['GenerateDataKey'])
            except ClientError as err:
                logger.error(
                    "Couldn't create a grant on key %s. Here's why: %s",
                    key_id, err.response['Error']['Message'])
            else:
                print(f"Grant created on key {key_id}.")
                return grant
        else:
            print("Skipping grant creation.)
```

- For API details, see [CreateGrant](#) in *AWS SDK for Python (Boto3) API Reference*.

## Create a key

The following code example shows how to create an AWS KMS key.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class KeyManager:
    def __init__(self, kms_client):
        self.kms_client = kms_client
        self.created_keys = []

    def create_key(self):
        """
        Creates a key (or multiple keys) with a user-provided description.
        """

        answer = 'y'
        while answer.lower() == 'y':
            key_desc = input("\nLet's create a key. Describe it for me: ")
            if not key_desc:
                key_desc = "Key management demo key"
            try:

## Encrypt text using a key

The following code example shows how to encrypt text using a KMS key.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class KeyEncrypt:  
    def __init__(self, kms_client):  
        self.kms_client = kms_client  
  
    def encrypt(self, key_id):  
        """  
        Encrypts text by using the specified key.  
  
        :param key_id: The ARN or ID of the key to use for encryption.  
        :return: The encrypted version of the text.  
        """  
        text = input("Enter some text to encrypt: ")  
        try:  
            cipher_text = self.kms_client.encrypt(  
               KeyId=key_id, Plaintext=text.encode())['CiphertextBlob']  
        except ClientError as err:  
            logger.error(  
                "Couldn't encrypt text. Here's why: %s", err.response['Error']  
                ['Message'])  
        else:  
            print(f"Your ciphertext is: {cipher_text}")  
            return cipher_text
```

- For API details, see [Encrypt](#) in *AWS SDK for Python (Boto3) API Reference*.

## Generate a plaintext data key for client-side encryption

The following code example shows how to generate a unique symmetric data key for client-side encryption from an AWS KMS key. The key contains both plaintext and ciphertext versions.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class KeyManager:  
    def __init__(self, kms_client):  
        self.kms_client = kms_client  
        self.created_keys = []  
  
    def generate_data_key(self, key_id):  
        """
```

```
Generates a symmetric data key that can be used for client-side encryption.  
"""  
answer = input(  
    f"Do you want to generate a symmetric data key from key {key_id} (y/n)? ")  
if answer.lower() == 'y':  
    try:  
        data_key = self.kms_client.generate_data_key(KeyId=key_id,  
KeySpec='AES_256')  
    except ClientError as err:  
        logger.error(  
            "Couldn't generate a data key for key %. Here's why: %s",  
            key_id, err.response['Error']['Message'])  
    else:  
        pprint(data_key)
```

- For API details, see [GenerateDataKey](#) in *AWS SDK for Python (Boto3) API Reference*.

## Get a policy for a key

The following code example shows how to get a policy by name for a KMS key.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class KeyPolicy:  
    def __init__(self, kms_client):  
        self.kms_client = kms_client  
  
    def get_policy(self, key_id):  
        """  
        Gets the policy of a key.  
  
        :param key_id: The ARN or ID of the key to query.  
        :return: The key policy as a dict.  
        """  
        if key_id != '':

## Manage keys

The following code example shows how to:

- Create a KMS key.
- List KMS keys for your account and get details about them.
- Enable and disable KMS keys.
- Generate a symmetric data key that can be used for client-side encryption.
- Delete KMS keys.

## Amazon Keyspaces examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with Amazon Keyspaces (for Apache Cassandra).

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Get started

#### [Hello Amazon Keyspaces](#)

The following code example shows how to get started using Amazon Keyspaces (for Apache Cassandra).

## Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
import boto3

def hello_keyspaces(keyspaces_client):
    """
    Use the AWS SDK for Python (Boto3) to create an Amazon Keyspaces (for Apache
    Cassandra) client and list the keyspaces in your account.
    This example uses the default settings specified in your shared credentials
    and config files.

    :param keyspaces_client: A Boto3 Amazon Keyspaces Client object. This object
    wraps
                           the low-level Amazon Keyspaces service API.
    """
    print("Hello, Amazon Keyspaces! Let's list some of your keyspaces:\n")
    for ks in keyspaces_client.list_keyspaces(maxResults=5).get('keyspaces', []):
        print(ks['keyspaceName'])
        print(f"\t{ks['resourceArn']}")

if __name__ == '__main__':
    hello_keyspaces(boto3.client('keyspaces'))
```

## Scenarios

### Get started with keyspaces and tables

The following code example shows how to:

- Create a keyspace.
- Create a table in the keyspace. The table is configured with a schema to hold movie data and has point-in-time recovery enabled.
- Connect to the keyspace with a connection secured by TLS and authenticated with Signature V4 (SigV4).
- Query the table by adding, retrieving, and updating movie data.
- Update the table by adding a column to track watched movies.
- Restore the table to a previous point in time.
- Delete the table and keyspace.

## SDK for Python (Boto3)

## Kinesis examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with Amazon Kinesis.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4044\)](#)

## Actions

### Create a stream

The following code example shows how to create a Kinesis stream.

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class KinesisStream:  
    """Encapsulates a Kinesis stream."""  
    def __init__(self, kinesis_client):  
        """  
        :param kinesis_client: A Boto3 Kinesis client.  
        """  
        self.kinesis_client = kinesis_client  
        self.name = None  
        self.details = None  
        self.stream_exists_waiter = kinesis_client.get_waiter('stream_exists')  
  
    def create(self, name, wait_until_exists=True):  
        """  
        Creates a stream.  
  
        :param name: The name of the stream.  
        :param wait_until_exists: When True, waits until the service reports that  
            the stream exists, then queries for its metadata.  
        """

## Kinesis Data Analytics examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with Amazon Kinesis Data Analytics.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4047\)](#)
- [Data generator \(p. 4055\)](#)

## Actions

### Add an input stream to an application

The following code example shows how to add an input stream to a Kinesis Data Analytics application.

## SDK for Python (Boto3)

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class KinesisAnalyticsApplicationV2:
    """Encapsulates Kinesis Data Analytics application functions."""
    def __init__(self, analytics_client):
        """
        :param analytics_client: A Boto3 Kinesis Data Analytics v2 client.
        """
        self.analytics_client = analytics_client
        self.name = None
        self.arn = None
        self.version_id = None
        self.create_timestamp = None

    def add_input(self, input_prefix, stream_arn, input_schema):
        """
        Adds an input stream to the application. The input stream data is mapped
        to an in-application stream that can be processed by your code running in
        Kinesis Data Analytics.

        :param input_prefix: The prefix prepended to in-application input stream names.
        :param stream_arn: The ARN of the input stream.
        :param input_schema: A schema that maps the data in the input stream to the
            runtime environment. This can be automatically generated
            by using `discover_input_schema` or you can create it
            yourself.
        :return: Metadata about the newly added input.
        """
        try:
            response = self.analytics_client.add_application_input(
                ApplicationName=self.name,
                CurrentApplicationVersionId=self.version_id,
                Input={
                    'NamePrefix': input_prefix,
                    'KinesisStreamsInput': {'ResourceARN': stream_arn},
                    'InputSchema': input_schema})

        raise
    else:
        return details
```

- For API details, see [UpdateApplication](#) in *AWS SDK for Python (Boto3) API Reference*.

## Data generator

### Generate a stream with a referrer

The following code example shows how to generate a Kinesis stream with a referrer.

For more information, see [Example: Extracting a portion of a stream](#).

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
import json
import boto3

STREAM_NAME = 'ExampleInputStream'

def get_data():
    return {'REFERRER': 'http://www.amazon.com'}
```

```
def generate(stream_name, kinesis_client):
    while True:
        data = get_data()
        print(data)
        kinesis_client.put_record(
            StreamName=stream_name,
            Data=json.dumps(data),
            PartitionKey='partitionkey')

if __name__ == '__main__':
    generate(STREAM_NAME, boto3.client('kinesis'))
```

### Generate a stream with blood pressure anomalies

The following code example shows how to generate a Kinesis stream with blood pressure anomalies.

For more information, see [Example: Detecting data anomalies and getting an explanation](#).

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
from enum import Enum
import json
import random
import boto3

STREAM_NAME = "ExampleInputStream"

class PressureType(Enum):
    low = 'LOW'
    normal = 'NORMAL'
    high = 'HIGH'

## Lambda examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with AWS Lambda.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4063\)](#)
- [Scenarios \(p. 4068\)](#)

## Actions

### Create a function

The following code example shows how to create a Lambda function.

## SDK for Python (Boto3)

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class LambdaWrapper:
    def __init__(self, lambda_client, iam_resource):
        self.lambda_client = lambda_client
        self.iam_resource = iam_resource

    def create_function(self, function_name, handler_name, iam_role,
deployment_package):
        """
        Deploys a Lambda function.

        :param function_name: The name of the Lambda function.
        :param handler_name: The fully qualified name of the handler function. This
            must include the file name and the function name.
        :param iam_role: The IAM role to use for the function.
        :param deployment_package: The deployment package that contains the function
            code in .zip format.
        :return: The Amazon Resource Name (ARN) of the newly created function.
        """
        try:
            response = self.lambda_client.create_function(
                FunctionName=function_name,
                Description="AWS Lambda doc example",
                Runtime='python3.8',
                Role=iam_role.arn,
                Handler=handler_name,
                Code={'ZipFile': deployment_package},
                Publish=True)

            "Couldn't list functions. Here's why: %s: %s",
            err.response['Error']['Code'], err.response['Error']['Message'])
        raise
```

- For API details, see [ListFunctions](#) in *AWS SDK for Python (Boto3) API Reference*.

## Update function code

The following code example shows how to update Lambda function code.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class LambdaWrapper:
    def __init__(self, lambda_client, iam_resource):
        self.lambda_client = lambda_client
        self.iam_resource = iam_resource

    def update_function_code(self, function_name, deployment_package):
        """
        Updates the code for a Lambda function by submitting a .zip archive that
        contains
        the code for the function.

        :param function_name: The name of the function to update.
        :param deployment_package: The function code to update, packaged as bytes in
                                  .zip format.
        :return: Data about the update, including the status.
        """
        try:
            response = self.lambda_client.update_function_code(
                FunctionName=function_name, ZipFile=deployment_package)
        except ClientError as err:
            logger.error(
                "Couldn't update function %s. Here's why: %s: %s",
                function_name, err.response['Error']['Code'],
                err.response['Error']['Message'])
            raise
        else:
            return response
```

- For API details, see [UpdateFunctionCode](#) in *AWS SDK for Python (Boto3) API Reference*.

## Update function configuration

The following code example shows how to update Lambda function configuration.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class LambdaWrapper:
    def __init__(self, lambda_client, iam_resource):
        self.lambda_client = lambda_client
        self.iam_resource = iam_resource

    def update_function_configuration(self, function_name, env_vars):
        """
        Updates the environment variables for a Lambda function.

        :param function_name: The name of the function to update.
        :param env_vars: A dict of environment variables to update.
        :return: Data about the update, including the status.
        """
        try:
            response = self.lambda_client.update_function_configuration(
                FunctionName=function_name, Environment={'Variables': env_vars})
        except ClientError as err:
            logger.error(
                "Couldn't update function configuration %s. Here's why: %s: %s",
                function_name,
                err.response['Error']['Code'], err.response['Error']['Message'])
            raise
        else:
            return response
```

- For API details, see [UpdateFunctionConfiguration](#) in *AWS SDK for Python (Boto3) API Reference*.

## Scenarios

### Get started with functions

The following code example shows how to:

- Create an AWS Identity and Access Management (IAM) role that grants Lambda permission to write to logs.
- Create a Lambda function and upload handler code.
- Invoke the function with a single parameter and get results.
- Update the function code and configure its Lambda environment with an environment variable.
- Invoke the function with new parameters and get results. Display the execution log that's returned from the invocation.
- List the functions for your account.
- Delete the IAM role and the Lambda function.

For more information, see [Create a Lambda function with the console](#).

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Define a Lambda handler that increments a number.

```
import logging
```

```
logger = logging.getLogger()
logger.setLevel(logging.INFO)

def lambda_handler(event, context):
    """
    Accepts an action and a single number, performs the specified action on the number,
    and returns the result. The only allowable action is 'increment'.

    :param event: The event dict that contains the parameters sent when the function
                  is invoked.
    :param context: The context in which the function is called.
    :return: The result of the action.
    """

## Lookout for Vision examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with Amazon Lookout for Vision.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4076\)](#)
- [Scenarios \(p. 4091\)](#)

## Actions

### Create a dataset

The following code example shows how to create a Lookout for Vision dataset.

For more information, see [Creating your dataset](#).

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```

## Create, train, and start a model

The following code example shows how to create, train, and start a Lookout for Vision model.

### SDK for Python (Boto3)

Creates and optionally starts an Amazon Lookout for Vision model using command line arguments. The example code creates a new project, training dataset, optional test dataset, and model. After model training is completed, you can use a provided script to try your model with an image.

This example requires a set of images to train its model. You can find example circuit board images on GitHub that you can use for training and testing. For details on how to copy these images to an Amazon Simple Storage Service (Amazon S3) bucket, see [Prepare example images](#).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Lookout for Vision

## Find a project with a specific tag

The following code example shows how to find a Lookout for Vision project with a specific tag.

For more information, see [Tagging models](#).

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
import logging

## Amazon Polly examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with Amazon Polly.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4106\)](#)
- [Scenarios \(p. 4112\)](#)

## Actions

### Get a lexicon

The following code example shows how to get an Amazon Polly lexicon.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class PollyWrapper:
    """Encapsulates Amazon Polly functions."""
    def __init__(self, polly_client, s3_resource):
        """
        :param polly_client: A Boto3 Amazon Polly client.
        :param s3_resource: A Boto3 Amazon Simple Storage Service (Amazon S3) resource.
        """
```

```
    self.polly_client = polly_client
    self.s3_resource = s3_resource
    self.voice_metadata = None

    def get_lexicon(self, name):
        """
        Gets metadata and contents of an existing lexicon.

        :param name: The name of the lexicon to retrieve.
        :return: The retrieved lexicon.
        """
        try:
            response = self.polly_client.get_lexicon(Name=name)
            logger.info("Got lexicon %s.", name)
        except ClientError:
            logger.exception("Couldn't get lexicon %s.", name)
            raise
        else:
            return response
```

- For API details, see [GetLexicon](#) in *AWS SDK for Python (Boto3) API Reference*.

## Get data about a speech synthesis task

The following code example shows how to get data about an existing asynchronous Amazon Polly speech synthesis task.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class PollyWrapper:
    """Encapsulates Amazon Polly functions."""
    def __init__(self, polly_client, s3_resource):
        """
        :param polly_client: A Boto3 Amazon Polly client.
        :param s3_resource: A Boto3 Amazon Simple Storage Service (Amazon S3) resource.
        """
        self.polly_client = polly_client
        self.s3_resource = s3_resource
        self.voice_metadata = None

## Scenarios

### Create a lip-sync application

The following code example shows how to create a lip-sync application with Amazon Polly.

#### SDK for Python (Boto3)

Shows how to use Amazon Polly and Tkinter to create a lip-sync application that displays an animated face speaking along with the speech synthesized by Amazon Polly. Lip-sync is accomplished by requesting a list of visemes from Amazon Polly that match up with the synthesized speech.

- Get voice metadata from Amazon Polly and display it in a Tkinter application.
- Get synthesized speech audio and matching viseme speech marks from Amazon Polly.
- Play the audio with synchronized mouth movements in an animated face.
- Submit asynchronous synthesis tasks for long texts and retrieve the output from an Amazon Simple Storage Service (Amazon S3) bucket.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Polly

## Amazon RDS examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with Amazon Relational Database Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

## Amazon Rekognition examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with Amazon Rekognition.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4132\)](#)
- [Scenarios \(p. 4147\)](#)

## Actions

### Compare faces in an image against a reference image

The following code example shows how to compare faces in an image against a reference image with Amazon Rekognition.

For more information, see [Comparing faces in images](#).

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class RekognitionImage:  
    """  
    Encapsulates an Amazon Rekognition image. This class is a thin wrapper  
    around parts of the Boto3 Amazon Rekognition API.  
    """  
    def __init__(self, image, image_name, rekognition_client):  
        """  
        Initializes the image object.  
  
        :param image: Data that defines the image, either the image bytes or  
                     an Amazon S3 bucket and object key.  
        :param image_name: The name of the image.  
        :param rekognition_client: A Boto3 Rekognition client.  
        """  
        self.image = image

## Scenarios

### Build a collection and find faces in it

The following code example shows how to:

- Create an Amazon Rekognition collection.
- Add images to the collection and detect faces in it.
- Search the collection for faces that match a reference image.
- Delete a collection.

For more information, see [Searching faces in a collection](#).

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create classes that wrap Amazon Rekognition functions.

```
import logging
from pprint import pprint
import boto3
from botocore.exceptions import ClientError
from rekognition_objects import RekognitionFace
from rekognition_image_detection import RekognitionImage

logger = logging.getLogger(__name__)
```

```

## Detect and display elements in images

The following code example shows how to:

- Detect elements in images by using Amazon Rekognition.
- Display images and draw bounding boxes around detected elements.

For more information, see [Displaying bounding boxes](#).

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create classes to wrap Amazon Rekognition functions.

```

## Amazon S3 examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with Amazon Simple Storage Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Get started

#### Hello Amazon S3

The following code example shows how to get started using Amazon Simple Storage Service (Amazon S3).

#### Python

##### SDK for Python (Boto3)

###### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
import boto3

def hello_s3():
    """
    Use the AWS SDK for Python (Boto3) to create an Amazon Simple Storage Service
    (Amazon S3) resource and list the buckets in your account.
    This example uses the default settings specified in your shared credentials
    and config files.
    """
    s3_resource = boto3.resource('s3')
    print("Hello, Amazon S3! Let's list your buckets:")
    for bucket in s3_resource.buckets.all():
        print(f"\t{bucket.name}")

if __name__ == '__main__':
    hello_s3()
```

- For API details, see [ListBuckets](#) in *AWS SDK for Python (Boto3) API Reference*.

## Topics

- [Actions \(p. 4164\)](#)
- [Scenarios \(p. 4185\)](#)

## Actions

### Add CORS rules to a bucket

The following code example shows how to add cross-origin resource sharing (CORS) rules to an S3 bucket.

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class BucketWrapper:  
    """Encapsulates S3 bucket actions."""  
    def __init__(self, bucket):  
        """  
        :param bucket: A Boto3 Bucket resource. This is a high-level resource in Boto3  
                      that wraps bucket actions in a class-like structure.  
        """  
        self.bucket = bucket  
        self.name = bucket.name  
  
    def put_cors(self, cors_rules):  
        """  
        Apply CORS rules to the bucket. CORS rules specify the HTTP actions that are  
        allowed from other domains.  
  
        :param cors_rules: The CORS rules to apply.  
        """

            raise
```

- For API details, see [CopyObject in AWS SDK for Python \(Boto3\) API Reference](#).

## Create a bucket

The following code example shows how to create an S3 bucket.

## SDK for Python (Boto3)

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a bucket with default settings.

```
class BucketWrapper:
    """Encapsulates S3 bucket actions."""
    def __init__(self, bucket):
        """
        :param bucket: A Boto3 Bucket resource. This is a high-level resource in Boto3
                       that wraps bucket actions in a class-like structure.
        """
        self.bucket = bucket
        self.name = bucket.name

    def create(self, region_override=None):
        """
        Create an Amazon S3 bucket in the default Region for the account or in the
        specified Region.

        :param region_override: The Region in which to create the bucket. If this is
                               not specified, the Region configured in your shared
                               credentials is used.
        """
        if region_override is not None:
            region = region_override
        else:
            region = self.bucket.meta.client.meta.region_name
        try:
            self.bucket.create(
                CreateBucketConfiguration={'LocationConstraint': region})

            self.bucket.wait_until_exists()
            logger.info(
                "Created bucket '%s' in region=%s", self.bucket.name, region)
        except ClientError as error:
            logger.exception(
                "Couldn't create bucket named '%s' in region=%s.",
                self.bucket.name, region)
            raise error
```

Create a versioned bucket with a lifecycle configuration.

```
def create_versioned_bucket(bucket_name, prefix):
    """
    Creates an Amazon S3 bucket, enables it for versioning, and configures a lifecycle
    that expires noncurrent object versions after 7 days.

    Adding a lifecycle configuration to a versioned bucket is a best practice.
    It helps prevent objects in the bucket from accumulating a large number of
    noncurrent versions, which can slow down request performance.

    Usage is shown in the usage_demo_single_object function at the end of this module.

    :param bucket_name: The name of the bucket to create.
    :param prefix: Identifies which objects are automatically expired under the
                   configured lifecycle rules.
    :return: The newly created bucket.
    """
```

```

try:
    bucket = s3.create_bucket(

## Get started with buckets and objects

The following code example shows how to:

- Create a bucket.
- Upload a file to the bucket.
- Download an object from a bucket.
- Copy an object to a subfolder in a bucket.
- List the objects in a bucket.
- Delete the objects in a bucket.
- Delete a bucket.

## Manage versioned objects in batches with a Lambda function

The following code example shows how to manage versioned S3 objects in batches with a Lambda function.

### SDK for Python (Boto3)

Shows how to manipulate Amazon Simple Storage Service (Amazon S3) versioned objects in batches by creating jobs that call AWS Lambda functions to perform processing. This example creates a version-enabled bucket, uploads the stanzas from the poem *You Are Old, Father William* by Lewis Carroll, and uses Amazon S3 batch jobs to twist the poem in various ways.

#### Learn how to:

- Create Lambda functions that operate on versioned objects.
- Create a manifest of objects to update.
- Create batch jobs that invoke Lambda functions to update objects.
- Delete Lambda functions.
- Empty and delete a versioned bucket.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon S3

## Upload or download large files

The following code example shows how to upload or download large files to and from Amazon S3.

For more information, see [Uploading an object using multipart upload](#).

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create functions that transfer files using several of the available transfer manager settings. Use a callback class to write callback progress during file transfer.

```
import sys
import threading

import boto3
from boto3.s3.transfer import TransferConfig

MB = 1024 * 1024
s3 = boto3.resource('s3')

class TransferCallback:
    """
```

```
Handle callbacks from the transfer manager.

The transfer manager periodically calls the __call__ method throughout
the upload and download process so that it can take action, such as
displaying progress to the user and collecting data about the transfer.
"""

def __init__(self, target_size):
    self._target_size = target_size
    self._total_transferred = 0
    self._lock = threading.Lock()
    self.thread_info = {}

def __call__(self, bytes_transferred):
    """
    The callback method that is called by the transfer manager.

    Display progress during file transfer and collect per-thread transfer
    data. This method can be called by multiple threads, so shared instance
    data is protected by a thread lock.
    """
    thread = threading.current_thread()
    with self._lock:
        self._total_transferred += bytes_transferred
        if thread.ident not in self.thread_info.keys():
            self.thread_info[thread.ident] = bytes_transferred
        else:
            self.thread_info[thread.ident] += bytes_transferred

        target = self._target_size * MB
        sys.stdout.write(
            f"\r{self._total_transferred} of {target} transferred "
            f"({(self._total_transferred / target) * 100:.2f}%).")
        sys.stdout.flush()

## Work with versioned objects

The following code example shows how to:

- Create a versioned S3 bucket.
- Get all versions of an object.
- Roll an object back to a previous version.
- Delete and restore a versioned object.
- Permanently delete all versions of an object.

## SDK for Python (Boto3)

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create functions that wrap S3 actions.

```
def create_versioned_bucket(bucket_name, prefix):
    """
    Creates an Amazon S3 bucket, enables it for versioning, and configures a lifecycle
    that expires noncurrent object versions after 7 days.

    Adding a lifecycle configuration to a versioned bucket is a best practice.
    It helps prevent objects in the bucket from accumulating a large number of
    noncurrent versions, which can slow down request performance.

    Usage is shown in the usage_demo_single_object function at the end of this module.

    :param bucket_name: The name of the bucket to create.
    :param prefix: Identifies which objects are automatically expired under the
                   configured lifecycle rules.
    :return: The newly created bucket.
    """

## S3 Glacier examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with Amazon S3 Glacier.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4202\)](#)
- [Scenarios \(p. 4210\)](#)

## Actions

### Create a vault

The following code example shows how to create an Amazon S3 Glacier vault.

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class GlacierWrapper:  
    """Encapsulates Amazon S3 Glacier API operations."""  
    def __init__(self, glacier_resource):  
        """  
        :param glacier_resource: A Boto3 Amazon S3 Glacier resource.  
        """  
        self.glacier_resource = glacier_resource  
  
    def create_vault(self, vault_name):

## Amazon SES examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with Amazon Simple Email Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4217\)](#)
- [Scenarios \(p. 4232\)](#)

## Actions

### Create a receipt filter

The following code example shows how to create an Amazon SES receipt filter that blocks incoming mail from an IP address or range of IP addresses.

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class SesReceiptHandler:  
    """Encapsulates Amazon SES receipt handling functions."""  
    def __init__(self, ses_client, s3_resource):  
        """  
        :param ses_client: A Boto3 Amazon SES client.  
        :param s3_resource: A Boto3 Amazon S3 resource.  
        """

## Amazon SNS examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with Amazon Simple Notification Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4247\)](#)

## Actions

### Create a topic

The following code example shows how to create an Amazon SNS topic.

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class SnsWrapper:  
    """Encapsulates Amazon SNS topic and subscription functions."""  
    def __init__(self, sns_resource):  
        """  
        :param sns_resource: A Boto3 Amazon SNS resource.  
        """  
        self.sns_resource = sns_resource  
  
    def create_topic(self, name):  
        """  
        Creates a notification topic.  
  
        :param name: The name of the topic to create.  
        :return: The newly created topic.  
        """  
        try:  
            topic = self.sns_resource.create_topic(Name=name)  
            logger.info("Created topic %s with ARN %s.", name, topic.arn)  
        except ClientError:  
            logger.exception("Couldn't create topic %s.", name)  
            raise  
        else:  
            return topic
```

- For API details, see [CreateTopic](#) in *AWS SDK for Python (Boto3) API Reference*.

## Delete a subscription

The following code example shows how to delete an Amazon SNS subscription.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class SnsWrapper:
    """Encapsulates Amazon SNS topic and subscription functions."""
    def __init__(self, sns_resource):
        """
        :param sns_resource: A Boto3 Amazon SNS resource.
        """
        self.sns_resource = sns_resource

## Scenarios

### Send and receive batches of messages

The following code example shows how to:

- Create an Amazon SQS queue.
- Send batches of messages to the queue.

- Receive batches of messages from the queue.
- Delete batches of messages from the queue.

## SDK for Python (Boto3)

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create functions to wrap Amazon SQS message functions.

```
import logging
import sys

import boto3
from botocore.exceptions import ClientError

import queue_wrapper

logger = logging.getLogger(__name__)
sns = boto3.resource('sns')

def send_messages(queue, messages):
    """
    Send a batch of messages in a single request to an SQS queue.
    This request may return overall success even when some messages were not sent.
    The caller must inspect the Successful and Failed lists in the response and
    resend any failed messages.

    :param queue: The queue to receive the messages.
    :param messages: The messages to send to the queue. These are simplified to
                     contain only the message body and attributes.
    :return: The response from SQS that contains the list of successful and failed
            messages.
    """
    try:
        entries = []
        for ind, msg in enumerate(messages):
            entries.append({
                'Id': str(ind),
                'MessageBody': msg['body'],
                'MessageAttributes': msg['attributes']
            })
        response = queue.send_messages(Entries=entries)
        if 'Successful' in response:
            for msg_meta in response['Successful']:
                logger.info(
                    "Message sent: %s: %s",
                    msg_meta['MessageId'],
                    messages[int(msg_meta['Id'])]['body']
                )
        if 'Failed' in response:
            for msg_meta in response['Failed']:
                logger.warning(
                    "Failed to send: %s: %s",
                    msg_meta['MessageId'],

## Actions

### Assume a role

The following code example shows how to assume a role with AWS STS.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Assume an IAM role that requires an MFA token and use temporary credentials to list Amazon S3 buckets for the account.

```
def list_buckets_from_assumed_role_with_mfa(
    assume_role_arn, session_name, mfa_serial_number, mfa_totp, sts_client):
    """
    Assumes a role from another account and uses the temporary credentials from
    that role to list the Amazon S3 buckets that are owned by the other account.
    Requires an MFA device serial number and token.

    The assumed role must grant permission to list the buckets in the other account.

    :param assume_role_arn: The Amazon Resource Name (ARN) of the role that
        grants access to list the other account's buckets.
    :param session_name: The name of the STS session.
    :param mfa_serial_number: The serial number of the MFA device. For a virtual MFA
        device, this is an ARN.
    :param mfa_totp: A time-based, one-time password issued by the MFA device.
    :param sts_client: A Boto3 STS instance that has permission to assume the role.
    """
    response = sts_client.assume_role(
        RoleArn=assume_role_arn,
        RoleSessionName=session_name,
        SerialNumber=mfa_serial_number,
        TokenCode=mfa_totp)
    temp_credentials = response['Credentials']
```

```
    print(f"Assumed role {assume_role_arn} and got temporary credentials.")

    s3_resource = boto3.resource(
        's3',
        aws_access_key_id=temp_credentials['AccessKeyId'],
        aws_secret_access_key=temp_credentials['SecretAccessKey'],
        aws_session_token=temp_credentials['SessionToken'])

    print(f"Listing buckets for the assumed role's account:")
    for bucket in s3_resource.buckets.all():
        print(bucket.name)
```

- For API details, see [AssumeRole](#) in *AWS SDK for Python (Boto3) API Reference*.

## Get a session token

The following code example shows how to get a session token with AWS STS and use it to perform a service action that requires an MFA token.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Get a session token by passing an MFA token and use it to list Amazon S3 buckets for the account.

```
def list_buckets_with_session_token_with_mfa(mfa_serial_number, mfa_totp, sts_client):
    """
    Gets a session token with MFA credentials and uses the temporary session
    credentials to list Amazon S3 buckets.

    Requires an MFA device serial number and token.

    :param mfa_serial_number: The serial number of the MFA device. For a virtual MFA
        device, this is an Amazon Resource Name (ARN).
    :param mfa_totp: A time-based, one-time password issued by the MFA device.
    :param sts_client: A Boto3 STS instance that has permission to assume the role.
    """
    if mfa_serial_number is not None:
        response = sts_client.get_session_token(
            SerialNumber=mfa_serial_number, TokenCode=mfa_totp)
    else:
        response = sts_client.get_session_token()
    temp_credentials = response['Credentials']

    s3_resource = boto3.resource(
        's3',
        aws_access_key_id=temp_credentials['AccessKeyId'],
        aws_secret_access_key=temp_credentials['SecretAccessKey'],
        aws_session_token=temp_credentials['SessionToken'])

    print(f"Buckets for the account:")
    for bucket in s3_resource.buckets.all():
        print(bucket.name)
```

- For API details, see [GetSessionToken](#) in *AWS SDK for Python (Boto3) API Reference*.

## Scenarios

### Assume an IAM role that requires an MFA token

The following code example shows how to:

- Create an IAM role that grants permission to list Amazon S3 buckets.
- Create an IAM user that has permission to assume the role only when MFA credentials are provided.
- Register an MFA device for the user.
- Assume the role and use temporary credentials to list S3 buckets.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create an IAM user, register an MFA device, and create a role that grants permission to list S3 buckets. The user has rights only to assume the role.

```
def setup(iam_resource):
    """
    Creates a new user with no permissions.
    Creates a new virtual MFA device.
    Displays the QR code to seed the device.
    Asks for two codes from the MFA device.
    Registers the MFA device for the user.
    Creates an access key pair for the user.
    Creates a role with a policy that lets the user assume the role and requires MFA.
    Creates a policy that allows listing Amazon S3 buckets.
    Attaches the policy to the role.
    Creates an inline policy for the user that lets the user assume the role.

    For demonstration purposes, the user is created in the same account as the role,
    but in practice the user would likely be from another account.

    Any MFA device that can scan a QR code will work with this demonstration.
    Common choices are mobile apps like LastPass Authenticator,
    Microsoft Authenticator, or Google Authenticator.

    :param iam_resource: A Boto3 AWS Identity and Access Management (IAM) resource
                         that has permissions to create users, roles, and policies
                         in the account.
    :return: The newly created user, user key, virtual MFA device, and role.
    """
    user = iam_resource.create_user(UserName=unique_name('user'))
    print(f"Created user {user.name}.")

    virtual_mfa_device = iam_resource.create_virtual_mfa_device(
        VirtualMFADeviceName=unique_name('mfa'))
    print(f"Created virtual MFA device {virtual_mfa_device.serial_number}")

    print(f"Showing the QR code for the device. Scan this in the MFA app of your "
          f"choice.")
    with open('qr.png', 'wb') as qr_file:
        qr_file.write(virtual_mfa_device.qr_code_png)

## Scenarios

### Create and manage a secret

The following code example shows how to:

- Create a Secrets Manager secret.
- Generate a random password and update a secret.
- Get current and previous values of a secret.
- Store binary data in a secret.
- Delete a secret.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a secret, update its value and stage, and delete the secret.

```
def create_and_manage_secret_demo():
    """
    Shows how to use AWS Secrets Manager to create a secret, update its value and
    stage, and delete it.
    """
    secret = SecretsManagerSecret(boto3.client('secretsmanager'))

    print("Create a secret.")
    secret.create("doc-example-secretsmanager-secret", "Shh, don't tell.")
    print("Get secret value.")
    value = secret.get_value()
    print(f"Secret value: {value['SecretString']}")

    print("Get a random password.")
    password = secret.get_random_password(20)
    print(f"Got password: {password}")

    print("Put password as new secret value.")
    secret.put_value(password)

    print("Get current and previous values.")
    current = secret.get_value()
    previous = secret.get_value('AWSPREVIOUS')
    print(f"Current: {current['SecretString']}")
    print(f"Previous: {previous['SecretString']}")

    byteval = base64.b64encode("I'm a Base64 string!".encode('utf-8'))
    stage = 'CUSTOM_STAGE'
    print(f"Put byte value with a custom stage '{stage}'")
    secret.put_value(byteval, [stage])
    time.sleep(1)

    print(f"Get secret value associated with stage '{stage}'")
    got_val = secret.get_value(stage)
```

```
    print(f"Raw bytes value: {got_val['SecretBinary']}")  
    print(f"Decoded value:  
{base64.b64decode(got_val['SecretBinary']).decode('utf-8')})")  
    pprint(secret.describe())  
    print("List 10 secrets for the account.")  
    for sec in secret.list(10):  
        print(f"Name: {sec['Name']}")  
    print("Delete the secret.")  
    secret.delete(True)
```

## Amazon Textract examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with Amazon Textract.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4287\)](#)

## Actions

### Analyze a document

The following code example shows how to analyze a document using Amazon Textract.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```

## Amazon Transcribe examples using SDK for Python (Boto3)

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Python (Boto3) with Amazon Transcribe.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4292\)](#)
- [Scenarios \(p. 4298\)](#)

## Actions

### Create a custom vocabulary

The following code example shows how to create a custom Amazon Transcribe vocabulary.

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
def create_vocabulary(
    vocabulary_name, language_code, transcribe_client,
    phrases=None, table_uri=None):
    """
    Creates a custom vocabulary that can be used to improve the accuracy of
    transcription jobs. This function returns as soon as the vocabulary processing
    is started. Call get_vocabulary to get the current status of the vocabulary.
    The vocabulary is ready to use when its status is 'READY'.

    :param vocabulary_name: The name of the custom vocabulary.
    :param language_code: The language code of the vocabulary.
        For example, en-US or nl-NL.
    :param transcribe_client: The Boto3 Transcribe client.
    :param phrases: A list of comma-separated phrases to include in the vocabulary.
    :param table_uri: A table of phrases and pronunciation hints to include in the
        vocabulary.
    :return: Information about the newly created vocabulary.
    """
    try:
        vocab_args = {'VocabularyName': vocabulary_name, 'LanguageCode': language_code}
        if phrases is not None:
```

```
    vocab_args['Phrases'] = phrases
    elif table_uri is not None:
        vocab_args['VocabularyFileUri'] = table_uri
    response = transcribe_client.create_vocabulary(**vocab_args)
    logger.info("Created custom vocabulary %s.", response['VocabularyName'])
except ClientError:
    logger.exception("Couldn't create custom vocabulary %s.", vocabulary_name)
    raise
else:
    return response
```

- For API details, see [CreateVocabulary](#) in *AWS SDK for Python (Boto3) API Reference*.

## Delete a custom vocabulary

The following code example shows how to delete a custom Amazon Transcribe vocabulary.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
def delete_vocabulary(vocabulary_name, transcribe_client):
    """
    Deletes a custom vocabulary.

    :param vocabulary_name: The name of the vocabulary to delete.
    :param transcribe_client: The Boto3 Transcribe client.
    """
    try:
        transcribe_client.delete_vocabulary(VocabularyName=vocabulary_name)
        logger.info("Deleted vocabulary %s.", vocabulary_name)
    except ClientError:
        logger.exception("Couldn't delete vocabulary %s.", vocabulary_name)
        raise
```

- For API details, see [DeleteVocabulary](#) in *AWS SDK for Python (Boto3) API Reference*.

## Delete a transcription job

The following code example shows how to delete an Amazon Transcribe transcription job.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
def delete_job(job_name, transcribe_client):
    """
    Deletes a transcription job. This also deletes the transcript associated with
    the job.

    :param job_name: The name of the job to delete.
    :param transcribe_client: The Boto3 Transcribe client.
    """
```

```
"""
try:
    transcribe_client.delete_transcription_job(
        TranscriptionJobName=job_name)

```

- For API details, see [UpdateVocabulary](#) in *AWS SDK for Python (Boto3) API Reference*.

## Scenarios

### Create and refine a custom vocabulary

The following code example shows how to:

- Upload an audio file to Amazon S3.
- Run an Amazon Transcribe job to transcribe the file and get the results.
- Create and refine a custom vocabulary to improve transcription accuracy.
- Run jobs with custom vocabularies and get the results.

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Transcribe an audio file that contains a reading of Jabberwocky by Lewis Carroll. Start by creating functions that wrap Amazon Transcribe actions.

```
def start_job(
    job_name, media_uri, media_format, language_code, transcribe_client,
    vocabulary_name=None):

## Transcribe audio and get job data

The following code example shows how to:

- Start a transcription job with Amazon Transcribe.
- Wait for the job to complete.
- Get the URI where the transcript is stored.

For more information, see [Getting started with Amazon Transcribe](#).

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
import time
import boto3

def transcribe_file(job_name, file_uri, transcribe_client):
    transcribe_client.start_transcription_job(
        TranscriptionJobName=job_name,
        Media={'MediaFileUri': file_uri},
        MediaFormat='wav',
        LanguageCode='en-US'
    )

    max_tries = 60
    while max_tries > 0:
        max_tries -= 1
        job = transcribe_client.get_transcription_job(TranscriptionJobName=job_name)
        job_status = job['TranscriptionJob']['TranscriptionJobStatus']
        if job_status in ['COMPLETED', 'FAILED']:
            print(f"Job {job_name} is {job_status}.")
            if job_status == 'COMPLETED':
                print(
                    f"Download the transcript from\n"
                    f"\t{job['TranscriptionJob']['Transcript']['TranscriptFileUri']}.")

        break
    else:
```

```
        print(f"Waiting for {job_name}. Current status is {job_status}.")  
        time.sleep(10)  
  
def main():  
    transcribe_client = boto3.client('transcribe')  
    file_uri = 's3://test-transcribe/answer2.wav'  
    transcribe_file('Example-job', file_uri, transcribe_client)  
  
if __name__ == '__main__':  
    main()
```

## Cross-service examples using SDK for Python (Boto3)

The following sample applications use the AWS SDK for Python (Boto3) to work across multiple AWS services.

### Examples

- [Create an API Gateway REST API to track COVID-19 data \(p. 4304\)](#)
- [Create a lending library REST API \(p. 4305\)](#)
- [Create a long-lived Amazon EMR cluster and run several steps using an AWS SDK \(p. 4305\)](#)
- [Create a messenger application with Step Functions \(p. 4306\)](#)
- [Create a short-lived Amazon EMR cluster and run a step using an AWS SDK \(p. 4306\)](#)
- [Create a web application to track DynamoDB data \(p. 4307\)](#)
- [Create a websocket chat application with API Gateway \(p. 4307\)](#)
- [Create an Aurora Serverless work item tracker \(p. 4307\)](#)
- [Create an Amazon Textract explorer application \(p. 4308\)](#)
- [Detect entities in text extracted from an image using an AWS SDK \(p. 4308\)](#)
- [Detect objects in images with Amazon Rekognition using an AWS SDK \(p. 4309\)](#)
- [Detect people and objects in a video with Amazon Rekognition using an AWS SDK \(p. 4309\)](#)
- [Use API Gateway to invoke a Lambda function \(p. 4310\)](#)
- [Use scheduled events to invoke a Lambda function \(p. 4310\)](#)

## Create an API Gateway REST API to track COVID-19 data

### SDK for Python (Boto3)

Shows how to use AWS Chalice with the AWS SDK for Python (Boto3) to create a serverless REST API that uses Amazon API Gateway, AWS Lambda, and Amazon DynamoDB. The REST API simulates a system that tracks daily cases of COVID-19 in the United States, using fictional data. Learn how to:

- Use AWS Chalice to define routes in Lambda functions that are called to handle REST requests that come through API Gateway.
- Use Lambda functions to retrieve and store data in a DynamoDB table to serve REST requests.
- Define table structure and security role resources in an AWS CloudFormation template.
- Use AWS Chalice and CloudFormation to package and deploy all necessary resources.

- Use CloudFormation to clean up all created resources.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- API Gateway
- AWS CloudFormation
- DynamoDB
- Lambda

## Create a lending library REST API

#### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) with the Amazon Relational Database Service (Amazon RDS) API and AWS Chalice to create a REST API backed by an Amazon Aurora database. The web service is fully serverless and represents a simple lending library where patrons can borrow and return books. Learn how to:

- Create and manage a serverless Aurora database cluster.
- Use AWS Secrets Manager to manage database credentials.
- Implement a data storage layer that uses Amazon RDS to move data into and out of the database.
- Use AWS Chalice to deploy a serverless REST API to Amazon API Gateway and AWS Lambda.
- Use the Requests package to send requests to the web service.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- API Gateway
- Lambda
- Amazon RDS
- Secrets Manager

## Create a long-lived Amazon EMR cluster and run several steps using an AWS SDK

#### SDK for Python (Boto3)

Create a long-lived Amazon EMR cluster that uses Apache Spark to query historical Amazon review data from the [Amazon Customer Reviews Dataset](#). Run a job that gets data for top-rated products in specific categories that contain keywords in their product titles. Job results are written to an Amazon Simple Storage Service (Amazon S3) bucket.

- Create an Amazon S3 bucket and upload a job script.
- Create AWS Identity and Access Management (IAM) roles.
- Create Amazon Elastic Compute Cloud (Amazon EC2) security groups.
- Create a long-lived cluster and run several job steps.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon EC2

- Amazon EMR
- IAM
- Amazon S3

## Create a messenger application with Step Functions

### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) with AWS Step Functions to create a messenger application that retrieves message records from an Amazon DynamoDB table and sends them with Amazon Simple Queue Service (Amazon SQS). The state machine integrates with an AWS Lambda function to scan the database for unsent messages.

- Create a state machine that retrieves and updates message records from an Amazon DynamoDB table.
- Update the state machine definition to also send messages to Amazon Simple Queue Service (Amazon SQS).
- Start and stop state machine runs.
- Connect to Lambda, DynamoDB, and Amazon SQS from a state machine by using service integrations.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- DynamoDB
- Lambda
- Amazon SQS
- Step Functions

## Create a short-lived Amazon EMR cluster and run a step using an AWS SDK

### SDK for Python (Boto3)

Create a short-lived Amazon EMR cluster that estimates the value of pi using Apache Spark to parallelize a large number of calculations. The job writes output to Amazon EMR logs and to an Amazon Simple Storage Service (Amazon S3) bucket. The cluster terminates itself after completing the job.

- Create an Amazon S3 bucket and upload a job script.
- Create AWS Identity and Access Management (IAM) roles.
- Create Amazon Elastic Compute Cloud (Amazon EC2) security groups.
- Create a short-lived cluster and run a single job step.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon EC2
- Amazon EMR
- IAM
- Amazon S3

## Create a web application to track DynamoDB data

### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) to create a REST service that tracks work items in Amazon DynamoDB and emails reports by using Amazon Simple Email Service (Amazon SES). This example uses the Flask web framework to handle HTTP routing and integrates with a React webpage to present a fully functional web application.

- Build a Flask REST service that integrates with AWS services.
- Read, write, and update work items that are stored in a DynamoDB table.
- Use Amazon SES to send email reports of work items.

For complete source code and instructions on how to set up and run, see the full example in the [AWS Code Examples Repository](#) on GitHub.

### Services used in this example

- DynamoDB
- Amazon SES

## Create a websocket chat application with API Gateway

### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) with Amazon API Gateway V2 to create a websocket API that integrates with AWS Lambda and Amazon DynamoDB.

- Create a websocket API served by API Gateway.
- Define a Lambda handler that stores connections in DynamoDB and posts messages to other chat participants.
- Connect to the websocket chat application and send messages with the Websockets package.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- API Gateway
- DynamoDB
- Lambda

## Create an Aurora Serverless work item tracker

### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) to create a REST service that tracks work items in an Amazon Aurora Serverless database and emails reports by using Amazon Simple Email Service (Amazon SES). This example uses the Flask web framework to handle HTTP routing and integrates with a React webpage to present a fully functional web application.

- Build a Flask REST service that integrates with AWS services.
- Read, write, and update work items that are stored in an Aurora Serverless database.
- Create an AWS Secrets Manager secret that contains database credentials and use it to authenticate calls to the database.
- Use Amazon SES to send email reports of work items.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

## Create an Amazon Textract explorer application

### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) with Amazon Textract to detect text, form, and table elements in a document image. The input image and Amazon Textract output are shown in a Tkinter application that lets you explore the detected elements.

- Submit a document image to Amazon Textract and explore the output of detected elements.
- Submit images directly to Amazon Textract or through an Amazon Simple Storage Service (Amazon S3) bucket.
- Use asynchronous APIs to start a job that publishes a notification to an Amazon Simple Notification Service (Amazon SNS) topic when the job completes.
- Poll an Amazon Simple Queue Service (Amazon SQS) queue for a job completion message and display the results.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon S3
- Amazon SNS
- Amazon SQS
- Amazon Textract

## Detect entities in text extracted from an image using an AWS SDK

### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) in a Jupyter notebook to detect entities in text that is extracted from an image. This example uses Amazon Textract to extract text from an image stored in Amazon Simple Storage Service (Amazon S3) and Amazon Comprehend to detect entities in the extracted text.

This example is a Jupyter notebook and must be run in an environment that can host notebooks. For instructions on how to run the example using Amazon SageMaker, see the directions in [ExtractAndComprehendNotebook.ipynb](#).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Comprehend
- Amazon S3
- Amazon Textract

## Detect objects in images with Amazon Rekognition using an AWS SDK

### SDK for Python (Boto3)

Shows you how to use the AWS SDK for Python (Boto3) to create a web application that lets you do the following:

- Upload photos to an Amazon Simple Storage Service (Amazon S3) bucket.
- Use Amazon Rekognition to analyze and label the photos.
- Use Amazon Simple Email Service (Amazon SES) to send email reports of image analysis.

This example contains two main components: a webpage written in JavaScript that is built with React, and a REST service written in Python that is built with Flask-RESTful.

You can use the React webpage to:

- Display a list of images that are stored in your S3 bucket.
- Upload images from your computer to your S3 bucket.
- Display images and labels that identify items that are detected in the image.
- Get a report of all images in your S3 bucket and send an email of the report.

The webpage calls the REST service. The service sends requests to AWS to perform the following actions:

- Get and filter the list of images in your S3 bucket.
- Upload photos to your S3 bucket.
- Use Amazon Rekognition to analyze individual photos and get a list of labels that identify items that are detected in the photo.
- Analyze all photos in your S3 bucket and use Amazon SES to email a report.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

## Detect people and objects in a video with Amazon Rekognition using an AWS SDK

### SDK for Python (Boto3)

Use Amazon Rekognition to detect faces, objects, and people in videos by starting asynchronous detection jobs. This example also configures Amazon Rekognition to notify an Amazon Simple Notification Service (Amazon SNS) topic when jobs complete and subscribes an Amazon Simple Queue Service (Amazon SQS) queue to the topic. When the queue receives a message about a job, the job is retrieved and the results are output.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Rekognition
- Amazon SNS

- Amazon SQS

## Use API Gateway to invoke a Lambda function

### SDK for Python (Boto3)

This example shows how to create and use an Amazon API Gateway REST API that targets an AWS Lambda function. The Lambda handler demonstrates how to route based on HTTP methods; how to get data from the query string, header, and body; and how to return a JSON response.

- Deploy a Lambda function.
- Create an API Gateway REST API.
- Create a REST resource that targets the Lambda function.
- Grant permission to let API Gateway invoke the Lambda function.
- Use the Requests package to send requests to the REST API.
- Clean up all resources created during the demo.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- API Gateway
- Lambda

## Use scheduled events to invoke a Lambda function

### SDK for Python (Boto3)

This example shows how to register an AWS Lambda function as the target of a scheduled Amazon EventBridge event. The Lambda handler writes a friendly message and the full event data to Amazon CloudWatch Logs for later retrieval.

- Deploys a Lambda function.
- Creates an EventBridge scheduled event and makes the Lambda function the target.
- Grants permission to let EventBridge invoke the Lambda function.
- Prints the latest data from CloudWatch Logs to show the result of the scheduled invocations.
- Cleans up all resources created during the demo.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- CloudWatch Logs
- EventBridge
- Lambda

## Code examples for SDK for Ruby

The code examples in this topic show you how to use the AWS SDK for Ruby with AWS.

### Examples

- [Single-service actions and scenarios using SDK for Ruby \(p. 4311\)](#)

# Single-service actions and scenarios using SDK for Ruby

The following code examples show how to perform actions and implement common scenarios by using the AWS SDK for Ruby with AWS services.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

## Services

- [DynamoDB examples using SDK for Ruby \(p. 4311\)](#)
- [EventBridge examples using SDK for Ruby \(p. 4324\)](#)
- [IAM examples using SDK for Ruby \(p. 4338\)](#)
- [Lambda examples using SDK for Ruby \(p. 4356\)](#)
- [Amazon S3 examples using SDK for Ruby \(p. 4366\)](#)
- [Amazon SNS examples using SDK for Ruby \(p. 4385\)](#)
- [AWS STS examples using SDK for Ruby \(p. 4390\)](#)

## DynamoDB examples using SDK for Ruby

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Ruby with Amazon DynamoDB.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

## Topics

- [Actions \(p. 4311\)](#)
- [Scenarios \(p. 4317\)](#)

## Actions

### Create a table

The following code example shows how to create a DynamoDB table.

#### SDK for Ruby

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
# Creates an Amazon DynamoDB table that can be used to store movie data.  
# The table uses the release year of the movie as the partition key and the  
# title as the sort key.  
#  
# @param table_name [String] The name of the table to create.  
# @return [Aws::Dynamodb::Table] The newly created table.  
def create_table(table_name)  
    @table = @dynamo_resource.create_table(  
        :table_name => table_name,  
        :attribute_definitions => [
```

```
table_name: table_name,
key_schema: [
    {attribute_name: "year", key_type: "HASH"}, # Partition key
    {attribute_name: "title", key_type: "RANGE"} # Sort key
],
attribute_definitions: [
    {attribute_name: "year", attribute_type: "N"},
    {attribute_name: "title", attribute_type: "S"}
],
provisioned_throughput: {read_capacity_units: 10, write_capacity_units: 10})
@dynamo_resource.client.wait_until(:table_exists, table_name: table_name)
rescue Aws::Errors::ServiceError => e
  puts("Couldn't create table #{table_name}. Here's why:")
  puts("\t#{e.code}: #{e.message}")
  raise
else
  @table
end
```

- For API details, see [CreateTable](#) in *AWS SDK for Ruby API Reference*.

## Delete a table

The following code example shows how to delete a DynamoDB table.

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
# Deletes the table.
def delete_table
  @table.delete
  @table = nil
rescue Aws::Errors::ServiceError => e
  puts("Couldn't delete table. Here's why:")
  puts("\t#{e.code}: #{e.message}")
  raise
end
```

- For API details, see [DeleteTable](#) in *AWS SDK for Ruby API Reference*.

## Delete an item from a table

The following code example shows how to delete an item from a DynamoDB table.

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
# Deletes a movie from the table.
#
# @param title [String] The title of the movie to delete.
# @param year [Integer] The release year of the movie to delete.
def delete_movie(title, year)
```

```
    @table.delete_item(key: {"year" => year, "title" => title})
rescue Aws::Errors::ServiceError => e
  puts("Couldn't delete movie #{title}. Here's why:")
  puts("\t#{e.code}: #{e.message}")
  raise
end
```

- For API details, see [DeleteItem](#) in *AWS SDK for Ruby API Reference*.

## Get an item from a table

The following code example shows how to get an item from a DynamoDB table.

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
# Gets movie data from the table for a specific movie.
#
# @param title [String] The title of the movie.
# @param year [Integer] The release year of the movie.
# @return [Hash] The data about the requested movie.
def get_movie(title, year)
  response = @table.get_item(key: {"year" => year, "title" => title})
rescue Aws::Errors::ServiceError => e
  puts("Couldn't get movie #{title} from table #{@table.name}. Here's why:")
  puts("\t#{e.code}: #{e.message}")
  raise
else
  response.item
end
```

- For API details, see [GetItem](#) in *AWS SDK for Ruby API Reference*.

## Get information about a table

The following code example shows how to get information about a DynamoDB table.

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
# Determines whether a table exists. As a side effect, stores the table in
# a member variable.
#
# @param table_name [String] The name of the table to check.
# @return [Boolean] True when the table exists; otherwise, False.
def exists?(table_name)
  table = Aws::DynamoDB::Table.new(table_name)
  table.load
  @table = table
rescue Aws::DynamoDB::Errors::ResourceNotFoundException
  puts("Table #{table_name} doesn't exist. Let's create it.")
```

```
    false
rescue Aws::Errors::ServiceError => e
  puts("Couldn't check for existence of #{table_name}. Here's why:")
  puts("\t#{e.code}: #{e.message}")
  raise
else
  !@table.nil?
end
```

- For API details, see [DescribeTable](#) in *AWS SDK for Ruby API Reference*.

## Put an item in a table

The following code example shows how to put an item in a DynamoDB table.

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
# Adds a movie to the table.
#
# @param title [String] The title of the movie.
# @param year [Integer] The release year of the movie.
# @param plot [String] The plot summary of the movie.
# @param rating [Float] The quality rating of the movie.
def add_movie(title:, year:, plot:, rating:)
  @table.put_item(
    item: {
      "year" => year,
      "title" => title,
      "info" => {"plot" => plot, "rating" => rating}})
rescue Aws::Errors::ServiceError => e
  puts("Couldn't add movie #{title} to table #{@table.name}. Here's why:")
  puts("\t#{e.code}: #{e.message}")
  raise
end
```

- For API details, see [PutItem](#) in *AWS SDK for Ruby API Reference*.

## Query a table

The following code example shows how to query a DynamoDB table.

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
# Queries for movies that were released in the specified year.
#
# @param year [Integer] The year to query.
# @return [Array] The list of movies that were released in the specified year.
def query_movies(year)
  response = @table.query(
```

```
key_condition_expression: "#yr = :year",
expression_attribute_names: {"#yr" => "year"},
expression_attribute_values: {":year" => year})
rescue Aws::Errors::ServiceError => e
  puts("Couldn't query for movies released in #{year}. Here's why:")
  puts("\t#{e.code}: #{e.message}")
  raise
else
  response.items
end
```

- For API details, see [Query in AWS SDK for Ruby API Reference](#).

## Scan a table

The following code example shows how to scan a DynamoDB table.

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
# Scans for movies that were released in a range of years.
# Uses a projection expression to return a subset of data for each movie.
#
# @param year_range [Hash] The range of years to retrieve.
# @return [Array] The list of movies released in the specified years.
def scan_movies(year_range)
  movies = []
  scan_hash = {
    filter_expression: "#yr between :start_yr and :end_yr",
    projection_expression: "#yr, title, info.rating",
    expression_attribute_names: {"#yr" => "year"},
    expression_attribute_values: {
      ":start_yr" => year_range[:start], ":end_yr" => year_range[:end]}
  }
  done = false
  start_key = nil
  until done
    scan_hash[:exclusive_start_key] = start_key unless start_key.nil?
    response = @table.scan(scan_hash)
    movies.concat(response.items) unless response.items.nil?
    start_key = response.last_evaluated_key
    done = start_key.nil?
  end
rescue Aws::Errors::ServiceError => e
  puts("Couldn't scan for movies. Here's why:")
  puts("\t#{e.code}: #{e.message}")
  raise
else
  movies
end
```

- For API details, see [Scan in AWS SDK for Ruby API Reference](#).

## Update an item in a table

The following code example shows how to update an item in a DynamoDB table.

## SDK for Ruby

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
# Updates rating and plot data for a movie in the table.  
#  
# @param title [String] The title of the movie to update.  
# @param year [Int] The release year of the movie to update.  
# @param rating [Float] The updated rating to give the movie.  
# @param plot [String] The updated plot summary to give the movie.  
# @return [Hash] The fields that were updated, with their new values.  
def update_movie(title:, year:, rating:, plot:)  
    response = @table.update_item(  
        key: {"year" => year, "title" => title},

## Write a batch of items

The following code example shows how to write a batch of DynamoDB items.

## SDK for Ruby

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
# Fills an Amazon DynamoDB table with the specified data. Items are sent in  
# batches of 25 until all items are written.  
#  
# @param movies [Enumerable] The data to put in the table. Each item must contain at  
# least the keys required by the schema that was specified when  
# the table was created.  
def write_batch(movies)  
    index = 0  
    slice_size = 25  
    while index < movies.length  
        movie_items = []  
        movies[index, slice_size].each do |movie|  
            movie_items.append({put_request: { item: movie }})  
        end  
        @dynamo_resource.batch_write_item({request_items: { @table.name =>  
            movie_items }})  
        index += slice_size  
    end
```

```
rescue Aws::Errors::ServiceError => e
  puts(
    "Couldn't load data into table #{@table.name}. Here's why:")
  puts("\t#{e.code}: #{e.message}")
  raise
end
```

- For API details, see [BatchWriteItem](#) in *AWS SDK for Ruby API Reference*.

## Scenarios

### Get started using tables, items, and queries

The following code example shows how to:

- Create a table that can hold movie data.
- Put, get, and update a single movie in the table.
- Write movie data to the table from a sample JSON file.
- Query for movies that were released in a given year.
- Scan for movies that were released in a range of years.
- Delete a movie from the table.
- Delete the table.

## SDK for Ruby

### Note

## EventBridge examples using SDK for Ruby

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Ruby with Amazon EventBridge.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Scenarios \(p. 4325\)](#)

## Scenarios

### Create and trigger a rule

The following code example shows how to create and trigger a rule in Amazon EventBridge.

#### SDK for Ruby

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Call the functions in the correct order.

```
require "aws-sdk-sns"
require "aws-sdk-iam"
require "aws-sdk-cloudwatchevents"
require "aws-sdk-ec2"
require "aws-sdk-cloudwatch"
require "aws-sdk-cloudwatchlogs"
require "securerandom"
```

Checks whether the specified Amazon Simple Notification Service (Amazon SNS) topic exists among those provided to this function.

```
# Checks whether the specified Amazon SNS
# topic exists among those provided to this function.
# This is a helper function that is called by the topic_exists? function.
#
# @param topics [Array] An array of Aws::SNS::Types::Topic objects.
# @param topic_arn [String] The ARN of the topic to find.
# @return [Boolean] true if the topic ARN was found; otherwise, false.
# @example
#   sns_client = Aws::SNS::Client.new(region: 'us-east-1')
#   response = sns_client.list_topics
#   if topic_found?(response.topics,
#     'arn:aws:sns:us-east-1:111111111111:aws-doc-sdk-examples-topic')
#   )
#     puts 'Topic found.'
#   end

def topic_found?(topics, topic_arn)
  topics.each do |topic|
    return true if topic.topic_arn == topic_arn
  end
  return false
end
```

Checks whether the specified topic exists among those available to the caller in Amazon SNS.

```
# Checks whether the specified topic exists among those available to the
# caller in Amazon SNS.
#
# @param sns_client [Aws::SNS::Client] An initialized Amazon SNS client.
# @param topic_arn [String] The ARN of the topic to find.
# @return [Boolean] true if the topic ARN was found; otherwise, false.
# @example
#   exit 1 unless topic_exists?(Aws::SNS::Client.new(region: 'us-east-1'),
```

```
#      'arn:aws:sns:us-east-1:111111111111:aws-doc-sdk-examples-topic'
#  )
def topic_exists?(sns_client, topic_arn)
  puts "Searching for topic with ARN '#{topic_arn}'..."

## IAM examples using SDK for Ruby

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Ruby with AWS Identity and Access Management.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4339\)](#)
- [Scenarios \(p. 4352\)](#)

## Actions

### Attach a policy to a role

The following code example shows how to attach an IAM policy to a role.

#### SDK for Ruby

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
# Creates a policy that grants permission to list S3 buckets in the account, and
# then attaches the policy to a role.
#
# @param policy_name [String] The name to give the policy.
# @param role [Aws::IAM::Role] The role that the policy is attached to.
# @return [Aws::IAM::Policy] The newly created policy.
def create_and_attach_role_policy(policy_name, role)
    policy = @iam_resource.create_policy(
        policy_name: policy_name,
        policy_document: {
            Version: "2012-10-17",
            Statement: [
                {
                    Effect: "Allow",
                    Action: "s3>ListAllMyBuckets",
                    Resource: "arn:aws:s3:::*"
                }
            ]
        }.to_json
    role.attach_policy(policy_arn: policy.arn)
    puts("Created policy #{policy.policy_name} and attached it to role #{role.name}.")

## Get a role

The following code example shows how to get an IAM role.

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
# Gets data about a role.
#
# @param name [String] The name of the role to look up.
# @return [Aws::IAM::Role] The retrieved role.
def get_role(name)
  role = @iam_resource.role(name)
  puts("Got data for role '#{role.name}'. Its ARN is '#{role.arn}' .")
rescue Aws::Errors::ServiceError => e
  puts("Couldn't get data for role '#{name}' Here's why:")
  puts("\t#{e.code}: #{e.message}")
```

```
    raise
else
  role
end
```

- For API details, see [GetRole](#) in *AWS SDK for Ruby API Reference*.

## Get the account password policy

The following code example shows how to get the IAM account password policy.

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
# Prints the password policy for the account.
def print_account_password_policy
  policy = @iam_resource.account_password_policy
  policy.load
  puts("The account password policy is:")
  puts(policy.data.to_h)
rescue Aws::Errors::ServiceError => e
  if e.code == "NoSuchEntity"
    puts("The account does not have a password policy.")
  else
    puts("Couldn't print the account password policy. Here's why:")
    puts("\t#{e.code}: #{e.message}")
    raise
  end
end
```

- For API details, see [GetAccountPasswordPolicy](#) in *AWS SDK for Ruby API Reference*.

## List SAML providers

The following code example shows how to list SAML providers for IAM.

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
# Lists up to a specified number of SAML providers for the account.
#
# @param count [Integer] The maximum number of providers to list.
def list_saml_providers(count)
  @iam_resource.saml_providers.limit(count).each do |provider|
    puts("\t#{provider.arn}")
  end
rescue Aws::Errors::ServiceError => e
  puts("Couldn't list SAML providers. Here's why:")
  puts("\t#{e.code}: #{e.message}")
  raise
end
```

- For API details, see [ListSAMLProviders](#) in *AWS SDK for Ruby API Reference*.

## List a user's access keys

The following code example shows how to list a user's IAM access keys.

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
# Deletes a user. If the user has inline policies or access keys, they are deleted
# before the user is deleted.
#
# @param user [Aws::IAM::User] The user to delete.
def delete_user(user)
    user.policies.each do |policy|
        name = policy.name
        policy.delete
        puts("Deleted user policy #{name}.")
    end
    user.access_keys.each do |key|
        key.delete
        puts("Deleted access key for user #{user.name}.")
    end
    name = user.name
    user.delete
    puts("Deleted user #{name}.")
rescue Aws::Errors::ServiceError => e

    end
```

- For API details, see [ListPolicies](#) in *AWS SDK for Ruby API Reference*.

## List policies attached to a role

The following code example shows how to list policies attached to an IAM role.

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
# Deletes a role. If the role has policies attached, they are detached and  
# deleted before the role is deleted.  
#  
# @param role [Aws::IAM::Role] The role to delete.  
def delete_role(role)  
    role.attached_policies.each do |policy|  
        name = policy.policy_name  
        policy.detach_role(role_name: role.name)  
        policy.delete  
        puts("Deleted policy #{name}.")  
    end  
    name = role.name  
    role.delete  
    puts("Deleted role #{name}.")  
rescue Aws::Errors::ServiceError => e  
    puts("Couldn't detach policies and delete role #{role.name}. Here's why:")  
    puts("\t#{e.code}: #{e.message}")
```

```
    raise
end
```

- For API details, see [ListAttachedRolePolicies](#) in *AWS SDK for Ruby API Reference*.

## List roles

The following code example shows how to list IAM roles.

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
# Lists up to a specified number of roles for the account.
#
# @param count [Integer] The maximum number of roles to list.
# @return [Array] The names of the listed roles.
def list_roles(count)
  role_names = []
  @iam_resource.roles.limit(count).each_with_index do |role, index|
    puts("\t#{index + 1}: #{role.name}")
    role_names.append(role.name)
  end
  rescue Aws::Errors::ServiceError => e
    puts("Couldn't list roles for the account. Here's why:")
    puts("\t#{e.code}: #{e.message}")
    raise
  else
    role_names
  end
```

- For API details, see [ListRoles](#) in *AWS SDK for Ruby API Reference*.

## List users

The following code example shows how to list IAM users.

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
# Lists up to a specified number of users in the account.
#
# @param count [Integer] The maximum number of users to list.
def list_users(count)
  @iam_resource.users.limit(count).each do |user|
    puts("\t#{user.name}")
  end
  rescue Aws::Errors::ServiceError => e
    puts("Couldn't list users for the account. Here's why:")
    puts("\t#{e.code}: #{e.message}")
    raise
  end
```

- For API details, see [ListUsers](#) in *AWS SDK for Ruby API Reference*.

## Scenarios

### Create a user and assume a role

The following code example shows how to:

- Create a user who has no permissions.
- Create a role that grants permission to list Amazon S3 buckets for the account.
- Add a policy to let the user assume the role.
- Assume the role and list Amazon S3 buckets using temporary credentials.
- Delete the policy, role, and user.

## Lambda examples using SDK for Ruby

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Ruby with AWS Lambda.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

## Topics

- [Actions \(p. 4357\)](#)
- [Scenarios \(p. 4361\)](#)

## Actions

### Create a function

The following code example shows how to create a Lambda function.

#### SDK for Ruby

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class LambdaWrapper
  attr_accessor :lambda_client

  def initialize
    @lambda_client = Aws::Lambda::Client.new
    @logger = Logger.new($stdout)
    @logger.level = Logger::WARN
  end

  # Deploys a Lambda function.
  #
  # @param function_name: The name of the Lambda function.
  # @param handler_name: The fully qualified name of the handler function. This
  #                      must include the file name and the function name.
  # @param role_arn: The IAM role to use for the function.
  # @param deployment_package: The deployment package that contains the function
  #                           code in .zip format.
  # @return: The Amazon Resource Name (ARN) of the newly created function.
  def create_function(function_name, handler_name, role_arn, deployment_package)
    response = @lambda_client.create_function({
      role: role_arn.to_s,
      function_name:,
      handler: handler_name,
      runtime: "ruby2.7",
      code: {
        zip_file: deployment_package
      },
      environment: {
        variables: {
          "LOG_LEVEL" => "info"
        }
      }
    })
    @lambda_client.wait_until(:function_active_v2, { function_name: }) do |w|
      w.max_attempts = 5
      w.delay = 5
    end
    response
  rescue Aws::Lambda::Errors::ServiceException => e
    @logger.error("There was an error creating #{function_name}:\n#{e.message}")
  rescue Aws::Waiters::Errors::WaiterFailed => e
    @logger.error("Failed waiting for #{function_name} to activate:\n#{e.message}")
  end
end
```

- For API details, see [CreateFunction](#) in *AWS SDK for Ruby API Reference*.

## Delete a function

The following code example shows how to delete a Lambda function.

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class LambdaWrapper
  attr_accessor :lambda_client

  def initialize
    @lambda_client = Aws::Lambda::Client.new
    @logger = Logger.new($stdout)
    @logger.level = Logger::WARN
  end

  # Deletes a Lambda function.
  # @param function_name: The name of the function to delete.
  def delete_function(function_name)
    print "Deleting function: #{function_name}..."
    @lambda_client.delete_function(
      function_name:
    )
    print "Done!".green
  rescue Aws::Lambda::Errors::ServiceException => e
    @logger.error("There was an error deleting #{function_name}:\n #{e.message}")
  end
```

- For API details, see [DeleteFunction](#) in *AWS SDK for Ruby API Reference*.

## Get a function

The following code example shows how to get a Lambda function.

  end

  # Gets data about a Lambda function.
  #
  # @param function_name: The name of the function.
  # @return response: The function data, or nil if no such function exists.
  def get_function(function_name)
```

```
@lambda_client.get_function(
  {
    function_name:
  }
)
rescue Aws::Lambda::Errors::ResourceNotFoundException => e
  @logger.debug("Could not find function: #{function_name}:\n #{e.message}")
  nil
end
```

- For API details, see [GetFunction](#) in *AWS SDK for Ruby API Reference*.

## Invoke a function

The following code example shows how to invoke a Lambda function.

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class LambdaWrapper
  attr_accessor :lambda_client

  def initialize
    @lambda_client = Aws::Lambda::Client.new
    @logger = Logger.new($stdout)
    @logger.level = Logger::WARN
  end

  # Invokes a Lambda function.
  # @param function_name [String] The name of the function to invoke.
  # @param payload [nil] Payload containing runtime parameters.
  # @return [Object] The response from the function invocation.
  def invoke_function(function_name, payload = nil)
    params = { function_name: }
    params[:payload] = payload unless payload.nil?
    @lambda_client.invoke(params)
  rescue Aws::Lambda::Errors::ServiceException => e
    @logger.error("There was an error executing #{function_name}:\n #{e.message}")
  end
```

- For API details, see [Invoke](#) in *AWS SDK for Ruby API Reference*.

## List functions

The following code example shows how to list Lambda functions.

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class LambdaWrapper
  attr_accessor :lambda_client
```

```
def initialize
  @lambda_client = Aws::Lambda::Client.new
  @logger = Logger.new($stdout)
  @logger.level = Logger::WARN
end

# Lists the Lambda functions for the current account.
def list_functions
  functions = []
  @lambda_client.list_functions.each do |response|
    response["functions"].each do |function|
      functions.append(function["function_name"])
    end
  end
  functions
rescue Aws::Lambda::Errors::ServiceException => e
  @logger.error("There was an error executing #{function_name}:\n #{e.message}")
end
```

- For API details, see [ListFunctions](#) in *AWS SDK for Ruby API Reference*.

## Update function code

The following code example shows how to update Lambda function code.

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class LambdaWrapper
  attr_accessor :lambda_client

  def initialize
    @lambda_client = Aws::Lambda::Client.new
    @logger = Logger.new($stdout)
    @logger.level = Logger::WARN
  end

  # Updates the code for a Lambda function by submitting a .zip archive that contains
  # the code for the function.

  # @param function_name: The name of the function to update.
  # @param deployment_package: The function code to update, packaged as bytes in
  #                           .zip format.
  # @return: Data about the update, including the status.
  def update_function_code(function_name, deployment_package)
    @lambda_client.update_function_code(
      function_name:,
      zip_file: deployment_package
    )
    @lambda_client.wait_until(:function_updated_v2, { function_name: }) do |w|
      w.max_attempts = 5
      w.delay = 5
    end
    rescue Aws::Lambda::Errors::ServiceException => e
      @logger.error("There was an error updating function code for: #{function_name}:\n#{e.message}")
      nil
    rescue Aws::Waiters::Errors::WaiterFailed => e
      @logger.error("Failed waiting for #{function_name} to update:\n #{e.message}")
    end
  end
```

```
    end
```

- For API details, see [UpdateFunctionCode](#) in *AWS SDK for Ruby API Reference*.

## Update function configuration

The following code example shows how to update Lambda function configuration.

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class LambdaWrapper
  attr_accessor :lambda_client

  def initialize
    @lambda_client = Aws::Lambda::Client.new
    @logger = Logger.new($stdout)
    @logger.level = Logger::WARN
  end

  # Updates the environment variables for a Lambda function.
  # @param function_name: The name of the function to update.
  # @param log_level: The log level of the function.
  # @return: Data about the update, including the status.
  def update_function_configuration(function_name, log_level)
    @lambda_client.update_function_configuration({
      function_name:,
      environment: {
        variables: {
          "LOG_LEVEL" => log_level
        }
      }
    })
    @lambda_client.wait_until(:function_updated_v2, { function_name: }) do |w|
      w.max_attempts = 5
      w.delay = 5
    end
    rescue Aws::Lambda::Errors::ServiceException => e
      @logger.error("There was an error updating configurations for #{function_name}:\n#{e.message}")
    rescue Aws::Waiters::Errors::WaiterFailed => e
      @logger.error("Failed waiting for #{function_name} to activate:\n#{e.message}")
    end
  end
end
```

- For API details, see [UpdateFunctionConfiguration](#) in *AWS SDK for Ruby API Reference*.

## Scenarios

### Get started with functions

The following code example shows how to:

- Create an AWS Identity and Access Management (IAM) role that grants Lambda permission to write to logs.
- Create a Lambda function and upload handler code.

- Invoke the function with a single parameter and get results.
- Update the function code and configure its Lambda environment with an environment variable.
- Invoke the function with new parameters and get results. Display the execution log that's returned from the invocation.
- List the functions for your account.
- Delete the IAM role and the Lambda function.

For more information, see [Create a Lambda function with the console](#).

## SDK for Ruby

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Set up pre-requisite IAM permissions for a Lambda function capable of writing logs.

```
# Get an AWS Identity and Access Management (IAM) role.
#
# @param iam_role_name: The name of the role to retrieve.
# @param action: Whether to create or destroy the IAM apparatus.
# @return: The IAM role.
def manage_iam(iam_role_name, action)
  role_policy = {
    'Version': "2012-10-17",
    'Statement': [
      {
        'Effect': "Allow",
        'Principal': {
          'Service': "lambda.amazonaws.com"
        },
        'Action': "sts:AssumeRole"
      }
    ]
  }
  case action
  when "create"
    role = $iam_client.create_role(
      role_name: iam_role_name,
      assume_role_policy_document: role_policy.to_json
    )
    $iam_client.attach_role_policy(
      {
        policy_arn: "arn:aws:iam::aws:policy/service-role/
AWSLambdaBasicExecutionRole",
        role_name: iam_role_name
      }
    )
    $iam_client.wait_until(:role_exists, { role_name: iam_role_name }) do |w|
      w.max_attempts = 5
      w.delay = 5
    end
    @logger.debug("Successfully created IAM role: #{role['role']['arn']}")
    @logger.debug("Enforcing a 10-second sleep to allow IAM role to activate fully.")
    sleep(10)
    return role, role_policy.to_json
  when "destroy"
    $iam_client.detach_role_policy(
      {
        policy_arn: "arn:aws:iam::aws:policy/service-role/
AWSLambdaBasicExecutionRole",
        role_name: iam_role_name
      }
    )
  end
end
```

```
        }
    )
    $iam_client.delete_role(
        role_name: iam_role_name
    )
    @logger.debug("Detached policy & deleted IAM role: #{iam_role_name}")
else
    raise "Incorrect action provided. Must provide 'create' or 'destroy'"
end
rescue Aws::Lambda::Errors::ServiceException => e
    @logger.error("There was an error creating role or attaching policy:\n#{e.message}")
end
```

Define a Lambda handler that increments a number provided as an invocation parameter.

```
require "logger"

# A function that increments a whole number by one (1) and logs the result.
# Requires a manually-provided runtime parameter, 'number', which must be Int
#
# @param event [Hash] Parameters sent when the function is invoked
# @param context [Hash] Methods and properties that provide information
# about the invocation, function, and execution environment.
# @return incremented_number [String] The incremented number.
def lambda_handler(event:, context:)
    logger = Logger.new($stdout)
    log_level = ENV["LOG_LEVEL"]
    logger.level = case log_level
                    when "debug"
                        Logger::DEBUG
                    when "info"
                        Logger::INFO
                    else
                        Logger::ERROR
                    end
    logger.debug("This is a debug log message.")
    logger.info("This is an info log message. Code executed successfully!")
    number = event["number"].to_i
    incremented_number = number + 1
    logger.info("You provided #{number.round} and it was incremented to
#{incremented_number.round}")
    incremented_number.round.to_s
end
```

Zip your Lambda function into a deployment package.

```
# Creates a Lambda deployment package in .zip format.
# This zip can be passed directly as a string to Lambda when creating the function.
#
# @param source_file: The name of the object, without suffix, for the Lambda file and
# zip.
# @return: The deployment package.
def create_deployment_package(source_file)
    Dir.chdir(File.dirname(__FILE__))
    if File.exist?("lambda_function.zip")
        File.delete("lambda_function.zip")
        @logger.debug("Deleting old zip: lambda_function.zip")
    end
    Zip::File.open("lambda_function.zip", create: true) {
        |zipfile|
```

```
        zipfile.add("lambda_function.rb", "#{source_file}.rb")
    }
    @logger.debug("Zipping #{source_file}.rb into: lambda_function.zip.")
    File.read("lambda_function.zip").to_s
rescue StandardError => e
    @logger.error("There was an error creating deployment package:\n #{e.message}")
end
```

### Create a new Lambda function.

```
# Deploys a Lambda function.
#
# @param function_name: The name of the Lambda function.
# @param handler_name: The fully qualified name of the handler function. This
#                      must include the file name and the function name.
# @param role_arn: The IAM role to use for the function.
# @param deployment_package: The deployment package that contains the function
#                            code in .zip format.
# @return: The Amazon Resource Name (ARN) of the newly created function.
def create_function(function_name, handler_name, role_arn, deployment_package)
    response = @lambda_client.create_function({
        role: role_arn.to_s,
        function_name:,
        handler: handler_name,
        runtime: "ruby2.7",
        code: {
            zip_file: deployment_package
        },
        environment: {
            variables: {
                "LOG_LEVEL" => "info"
            }
        }
    })
    @lambda_client.wait_until(:function_active_v2, { function_name: }) do |w|
        w.max_attempts = 5
        w.delay = 5
    end
    response
rescue Aws::Lambda::Errors::ServiceException => e
    @logger.error("There was an error creating #{function_name}:\n #{e.message}")
rescue Aws::Waiters::Errors::WaiterFailed => e
    @logger.error("Failed waiting for #{function_name} to activate:\n #{e.message}")
end
```

### Invoke your Lambda function with optional runtime parameters.

```
# Invokes a Lambda function.
# @param function_name [String] The name of the function to invoke.
# @param payload [nil] Payload containing runtime parameters.
# @return [Object] The response from the function invocation.
def invoke_function(function_name, payload = nil)
    params = { function_name: }
    params[:payload] = payload unless payload.nil?
    @lambda_client.invoke(params)
rescue Aws::Lambda::Errors::ServiceException => e
    @logger.error("There was an error executing #{function_name}:\n #{e.message}")
end
```

### Update your Lambda function's configuration to inject a new environment variable.

```
# Updates the environment variables for a Lambda function.
# @param function_name: The name of the function to update.
# @param log_level: The log level of the function.
# @return: Data about the update, including the status.
def update_function_configuration(function_name, log_level)
    @lambda_client.update_function_configuration({
        function_name:,
        environment: {
            variables: {
                "LOG_LEVEL" => log_level
            }
        }
    })
    @lambda_client.wait_until(:function_updated_v2, { function_name: }) do |w|
        w.max_attempts = 5
        w.delay = 5
    end
rescue Aws::Lambda::Errors::ServiceException => e
    @logger.error("There was an error updating configurations for #{function_name}:\n#{e.message}")
rescue Aws::Waiters::Errors::WaiterFailed => e
    @logger.error("Failed waiting for #{function_name} to activate:\n #{e.message}")
end
```

Update your Lambda function's code with a different deployment package containing different code.

```
# Updates the code for a Lambda function by submitting a .zip archive that contains
# the code for the function.

# @param function_name: The name of the function to update.
# @param deployment_package: The function code to update, packaged as bytes in
#                           .zip format.
# @return: Data about the update, including the status.
def update_function_code(function_name, deployment_package)
    @lambda_client.update_function_code(
        function_name:,
        zip_file: deployment_package
    )
    @lambda_client.wait_until(:function_updated_v2, { function_name: }) do |w|
        w.max_attempts = 5
        w.delay = 5
    end
rescue Aws::Lambda::Errors::ServiceException => e
    @logger.error("There was an error updating function code for: #{function_name}:\n#{e.message}")
    nil
rescue Aws::Waiters::Errors::WaiterFailed => e
    @logger.error("Failed waiting for #{function_name} to update:\n #{e.message}")
end
```

List all existing Lambda functions using the built-in paginator.

```
# Lists the Lambda functions for the current account.
def list_functions
    functions = []
    @lambda_client.list_functions.each do |response|
        response["functions"].each do |function|
            functions.append(function["function_name"])
        end
    end
    functions
```

```
rescue Aws::Lambda::Errors::ServiceException => e
  @logger.error("There was an error executing #{function_name}:\n #{e.message}")
end
```

Delete a specific Lambda function.

```
# Deletes a Lambda function.
# @param function_name: The name of the function to delete.
def delete_function(function_name)
  print "Deleting function: #{function_name}..."
  @lambda_client.delete_function(
    function_name:
  )
  print "Done!".green
rescue Aws::Lambda::Errors::ServiceException => e
  @logger.error("There was an error deleting #{function_name}:\n #{e.message}")
end
```

## Amazon S3 examples using SDK for Ruby

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Ruby with Amazon Simple Storage Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4366\)](#)
- [Scenarios \(p. 4381\)](#)

## Actions

### Add CORS rules to a bucket

The following code example shows how to add cross-origin resource sharing (CORS) rules to an S3 bucket.

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
require "aws-sdk-s3"

# Wraps Amazon S3 bucket CORS configuration.
class BucketCorsWrapper
  attr_reader :bucket_cors

  # @param bucket_cors [Aws::S3::BucketCors] A bucket CORS object configured with an
  # existing bucket.
  def initialize(bucket_cors)
    @bucket_cors = bucket_cors
  end

  # Sets CORS rules on a bucket.
  #
  # @param allowed_methods [Array<String>] The types of HTTP requests to allow.
  # @param allowed_origins [Array<String>] The origins to allow.
  # @returns [Boolean] True if the CORS rules were set; otherwise, false.
  def set_cors(allowed_methods, allowed_origins)
    @bucket_cors.put(
      cors_configuration: {
        cors_rules: [
          {
            allowed_methods: allowed_methods,
            allowed_origins: allowed_origins,
            allowed_headers: %w[*],
            max_age_seconds: 3600
          }
        ]
      }
    )
    true
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't set CORS rules for #{@bucket_cors.bucket.name}. Here's why:
#{e.message}"
    false
  end
end
```

- For API details, see [PutBucketCors](#) in *AWS SDK for Ruby API Reference*.

## Add a policy to a bucket

The following code example shows how to add a policy to an S3 bucket.

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
# Wraps an Amazon S3 bucket policy.
class BucketPolicyWrapper
  attr_reader :bucket_policy

  # @param bucket_policy [Aws::S3::BucketPolicy] A bucket policy object configured with
  # an existing bucket.
  def initialize(bucket_policy)
    @bucket_policy = bucket_policy
  end
```

```
# Sets a policy on a bucket.  
#  
def set_policy(policy)  
    @bucket_policy.put(policy: policy)  
    true  
rescue Aws::Errors::ServiceError => e  
    puts "Couldn't set the policy for #{@bucket_policy.bucket.name}. Here's why:  
#{e.message}"  
    false  
end  
end
```

- For API details, see [PutBucketPolicy in AWS SDK for Ruby API Reference](#).

## Copy an object from one bucket to another

The following code example shows how to copy an S3 object from one bucket to another.

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Copy an object.

```
require "aws-sdk-s3"  
  
# Wraps Amazon S3 object actions.  
class ObjectCopyWrapper  
    attr_reader :source_object  
  
    # @param source_object [Aws::S3::Object] An existing Amazon S3 object. This is used  
    # as the source object for  
    #                                         copy actions.  
    def initialize(source_object)  
        @source_object = source_object  
    end  
  
    # Copy the source object to the specified target bucket and rename it with the target  
    # key.  
    #  
    # @param target_bucket [Aws::S3::Bucket] An existing Amazon S3 bucket where the  
    # object is copied.  
    # @param target_object_key [String] The key to give the copy of the object.  
    # @return [Aws::S3::Object, nil] The copied object when successful; otherwise, nil.  
    def copy_object(target_bucket, target_object_key)  
        @source_object.copy_to(bucket: target_bucket.name, key: target_object_key)  
        target_bucket.object(target_object_key)  
        rescue Aws::Errors::ServiceError => e  
            puts "Couldn't copy #{@source_object.key} to #{target_object_key}. Here's why:  
#{e.message}"  
        end  
    end  
  
    # Replace the source and target bucket names with existing buckets you own and replace  
    # the source object key  
    # with an existing object in the source bucket.  
    def run_demo  
        source_bucket_name = "doc-example-bucket1"  
        source_key = "my-source-file.txt"  
        target_bucket_name = "doc-example-bucket2"
```

```
target_key = "my-target-file.txt"

source_bucket = Aws::S3::Bucket.new(source_bucket_name)
wrapper = ObjectCopyWrapper.new(source_bucket.object(source_key))
target_bucket = Aws::S3::Bucket.new(target_bucket_name)
target_object = wrapper.copy_object(target_bucket, target_key)
return unless target_object

puts "Copied #{source_key} from #{source_bucket_name} to
#{target_object.bucket_name}:#{target_object.key}."
end

run_demo if $PROGRAM_NAME == __FILE__
```

Copy an object and add server-side encryption to the destination object.

```
require "aws-sdk-s3"

# Wraps Amazon S3 object actions.
class ObjectCopyEncryptWrapper
  attr_reader :source_object

  # @param source_object [Aws::S3::Object] An existing Amazon S3 object. This is used
  # as the source object for
  #                               copy actions.
  def initialize(source_object)
    @source_object = source_object
  end

  # Copy the source object to the specified target bucket, rename it with the target
  # key, and encrypt it.
  #
  # @param target_bucket [Aws::S3::Bucket] An existing Amazon S3 bucket where the
  # object is copied.
  # @param target_object_key [String] The key to give the copy of the object.
  # @return [Aws::S3::Object, nil] The copied object when successful; otherwise, nil.
  def copy_object(target_bucket, target_object_key, encryption)
    @source_object.copy_to(bucket: target_bucket.name, key: target_object_key,
server_side_encryption: encryption)
    target_bucket.object(target_object_key)
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't copy #{@source_object.key} to #{target_object_key}. Here's why:
#{e.message}"
  end
end

# Replace the source and target bucket names with existing buckets you own and replace
# the source object key
# with an existing object in the source bucket.
def run_demo
  source_bucket_name = "doc-example-bucket1"
  source_key = "my-source-file.txt"
  target_bucket_name = "doc-example-bucket2"
  target_key = "my-target-file.txt"
  target_encryption = "AES256"

  source_bucket = Aws::S3::Bucket.new(source_bucket_name)
  wrapper = ObjectCopyEncryptWrapper.new(source_bucket.object(source_key))
  target_bucket = Aws::S3::Bucket.new(target_bucket_name)
  target_object = wrapper.copy_object(target_bucket, target_key, target_encryption)
  return unless target_object

  puts "Copied #{source_key} from #{source_bucket_name} to
#{target_object.bucket_name}:#{target_object.key} and \"\\"
```

```
    "encrypted the target with #{target_object.server_side_encryption} encryption."
end

run_demo if $PROGRAM_NAME == __FILE__
```

- For API details, see [CopyObject](#) in *AWS SDK for Ruby API Reference*.

## Create a bucket

The following code example shows how to create an S3 bucket.

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
require "aws-sdk-s3"

# Wraps Amazon S3 bucket actions.
class BucketCreateWrapper
  attr_reader :bucket

  # @param bucket [Aws::S3::Bucket] An Amazon S3 bucket initialized with a name. This
  # is a client-side object until

## Actions

### Create a topic

The following code example shows how to create an Amazon SNS topic.

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
require "aws-sdk-sns" # v2: require 'aws-sdk'

def topic_created?(sns_client, topic_name)

  sns_client.create_topic(name: topic_name)
  rescue StandardError => e
    puts "Error while creating the topic named '#{topic_name}': #{e.message}"
end
```

```
# Full example call:  
def run_me  
  topic_name = "TOPIC_NAME"  
  region = "REGION"  
  
  sns_client = Aws::SNS::Client.new(region: region)  
  
  puts "Creating the topic '#{topic_name}'..."  
  
  if topic_created?(sns_client, topic_name)  
    puts "The topic was created."  
  else  
    puts "The topic was not created. Stopping program."  
    exit 1  
  end  
end  
  
run_me if $PROGRAM_NAME == __FILE__
```

- For more information, see [AWS SDK for Ruby Developer Guide](#).
- For API details, see [CreateTopic](#) in *AWS SDK for Ruby API Reference*.

### List the subscribers of a topic

The following code example shows how to retrieve the list of subscribers of an Amazon SNS topic.

#### SDK for Ruby

##### Note

## DynamoDB examples using SDK for Rust

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Rust with Amazon DynamoDB.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4398\)](#)

## Actions

### Create a table

The following code example shows how to create a DynamoDB table.

#### SDK for Rust

##### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
pub async fn create_table(client: &Client, table: &str, key: &str) -> Result<(), Error> {  
    let a_name: String = key.into();  
    let table_name: String = table.into();  
  
    let ad = AttributeDefinition::builder()  
        .attribute_name(&a_name)  
        .attribute_type(ScalarAttributeType::S)  
        .build();  
  
    let ks = KeySchemaElement::builder()  
        .attribute_name(&a_name)  
        .key_type(KeyType::Hash)  
        .build();  
  
    let pt = ProvisionedThroughput::builder()  
        .read_capacity_units(10)  
        .write_capacity_units(5)  
        .build();
```

```
let create_table_response = client
    .create_table()
    .table_name(table_name)
    .key_schema(ks)
    .attribute_definitions(ad)
    .provisioned_throughput(pt)
    .send()
    .await;

match create_table_response {
    Ok(_) => {
        println!("Added table {} with key {}", table, key);
        Ok(())
    }
    Err(e) => {
        eprintln!("Got an error creating table:");
        eprintln!("{}: {}", "{}", e);
        Err(Error::Unhandled(Box::new(e)))
    }
}
```

- For API details, see [CreateTable](#) in *AWS SDK for Rust API reference*.

## Delete a table

The following code example shows how to delete a DynamoDB table.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
pub async fn delete_table(client: &Client, table: &str) -> Result<(), Error> {
    client.delete_table().table_name(table).send().await?;

    println!("Deleted table");

    Ok(())
}
```

- For API details, see [DeleteTable](#) in *AWS SDK for Rust API reference*.

## Delete an item from a table

The following code example shows how to delete an item from a DynamoDB table.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
pub async fn delete_item(
    client: &Client,
    table: &str,
    key: &str,
    value: &str,
) -> Result<(), Error> {
    match client
        .delete_item()
        .table_name(table)
        .key(key, AttributeValue::S(value.into()))
        .send()
        .await
    {
        Ok(_) => {
            println!("Deleted item from table");
            Ok(())
        }
        Err(e) => Err(Error::Unhandled(Box::new(e))),
    }
}
```

- For API details, see [DeleteItem](#) in *AWS SDK for Rust API reference*.

## List tables

The following code example shows how to list DynamoDB tables.

### SDK for Rust

**Note**

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
pub async fn list_tables(client: &Client) -> Result<(), Error> {
    let paginator = client.list_tables().intoPaginator().items().send();
    let table_names = paginator.collect::<Result<Vec<_>, _>>().await?;

    println!("Tables:");

    for name in &table_names {
        println!("  {}", name);
    }

    println!("Found {} tables", table_names.len());
    Ok(())
}
```

Determine whether table exists.

```
pub async fn table_exists(client: &Client, table: &str) -> Result<bool, Error> {
    debug!("Checking for table: {table}");
    let table_list = client.list_tables().send().await;

    match table_list {
        Ok(list) => Ok(list.table_names().as_ref().unwrap().contains(&table.into())),
        Err(e) => Err(Error::Unhandled(Box::new(e))),
    }
}
```

- For API details, see [ListTables](#) in *AWS SDK for Rust API reference*.

## Put an item in a table

The following code example shows how to put an item in a DynamoDB table.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
pub async fn add_item(client: &Client, item: Item, table: &String) -> Result<(), Error> {
    let user_av = AttributeValue::S(item.username);
    let type_av = AttributeValue::S(item.p_type);
    let age_av = AttributeValue::S(item.age);
    let first_av = AttributeValue::S(item.first);
    let last_av = AttributeValue::S(item.last);

    let request = client
        .put_item()
        .table_name(table)
        .item("username", user_av)
        .item("account_type", type_av)
        .item("age", age_av)
        .item("first_name", first_av)
        .item("last_name", last_av);

    println!("Executing request [{request:?}] to add item...");

    let resp = request.send().await?;

    let attributes = resp.attributes().unwrap();

    println!(
        "Added user {:?}, {:?} {:?}, age {:?} as {:?} user",
        attributes.get("username"),
        attributes.get("first_name"),
        attributes.get("last_name"),
        attributes.get("age"),
        attributes.get("p_type")
    );
}

Ok(())
}
```

- For API details, see [PutItem](#) in *AWS SDK for Rust API reference*.

## Query a table

The following code example shows how to query a DynamoDB table.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Find the movies made in the specified year.

```
pub async fn movies_in_year(
    client: &Client,
    table_name: &str,
    year: u16,
) -> Result<Vec<Movie>, MovieError> {
    let results = client
        .query()
        .table_name(table_name)
        .key_condition_expression("#yr = :yyyy")
        .expression_attribute_names("#yr", "year")
        .expression_attribute_values(":yyyy", AttributeValue::N(year.to_string()))
        .send()
        .await?;

    if let Some(items) = results.items {
        let movies = items.iter().map(|v| v.into()).collect();
        Ok(movies)
    } else {
        Ok(vec![])
    }
}
```

- For API details, see [Query](#) in *AWS SDK for Rust API reference*.

## Scan a table

The following code example shows how to scan a DynamoDB table.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
pub async fn list_items(client: &Client, table: &str) -> Result<(), Error> {
```

```
let items: Result<Vec<_>, _> = client
    .scan()
    .table_name(table)
    .into_paginator()
    .items()
    .send()
    .collect()
    .await;

    println!("Items in table:");
    for item in items? {
        println!("  {:?}", item);
    }

    Ok(())
}
```

- For API details, see [Scan](#) in *AWS SDK for Rust API reference*.

## Amazon EBS examples using SDK for Rust

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Rust with Amazon Elastic Block Store.

**Actions** are code excerpts that show you how to call individual service functions.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

## Actions

### Create a snapshot

The following code example shows how to create an Amazon EBS snapshot.

#### SDK for Rust

##### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn start(client: &Client, description: &str) -> Result<String, Error> {
    let snapshot = client
        .start_snapshot()
        .description(description)
        .encrypted(false)
        .volume_size(1)
        .send()
        .await?;
```

```
    Ok(snapshot.snapshot_id.unwrap())
}
```

- For API details, see [StartSnapshot](#) in *AWS SDK for Rust API reference*.

## Seal and complete a snapshot

The following code example shows how to seal and complete an Amazon EBS snapshot.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn finish(client: &Client, id: &str) -> Result<(), Error> {
    client
        .complete_snapshot()
        .changed_blocks_count(2)
        .snapshot_id(id)
        .send()
        .await?;

    println!("Snapshot ID {}", id);
    println!("The state is 'completed' when all of the modified blocks have been transferred to Amazon S3.");
    println!("Use the get-snapshot-state code example to get the state of the snapshot.");

    Ok(())
}
```

- For API details, see [CompleteSnapshot](#) in *AWS SDK for Rust API reference*.

## Write a block of data to a snapshot

The following code example shows how to write a block of data to an Amazon EBS snapshot.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn add_block(
    client: &Client,
```

```
        id: &str,
        idx: usize,
        block: Vec<u8>,
        checksum: &str,
    ) -> Result<(), Error> {
    client
        .put_snapshot_block()
        .snapshot_id(id)
        .block_index(idx as i32)
        .block_data(ByteStream::from(block))
        .checksum(checksum)
        .checksum_algorithm(ChecksumAlgorithm::ChecksumAlgorithmSha256)
        .data_length(EBS_BLOCK_SIZE as i32)
        .send()
        .await?;

    Ok(())
}
```

- For API details, see [PutSnapshotBlock](#) in *AWS SDK for Rust API reference*.

## Amazon EC2 examples using SDK for Rust

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Rust with Amazon Elastic Compute Cloud.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

## Describe snapshots

The following code example shows how to describe Amazon EBS snapshots.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Shows the state of a snapshot.

```
async fn show_state(client: &Client, id: &str) -> Result<(), Error> {
    let resp = client
        .describe_snapshots()
        .filters(Filter::builder().name("snapshot-id").values(id).build())
        .send()
        .await?;

    println!(
        "State: {}",
        resp.snapshots()
            .unwrap()
            .first()
            .unwrap()
            .state()
            .unwrap()
            .as_ref()
    );
    Ok(())
}
```

```
async fn show_snapshots(client: &Client) -> Result<(), Error> {
    // "self" represents your account ID.
    // You can list the snapshots for any account by replacing
    // "self" with that account ID.
    let resp = client.describe_snapshots().owner_ids("self").send().await?;
    let snapshots = resp.snapshots().unwrap();
    let length = snapshots.len();

    for snapshot in snapshots {
        println!(
            "ID:          {}",
            snapshot.snapshot_id().unwrap_or_default()
        );
        println!(
            "Description: {}",
            snapshot.description().unwrap_or_default()
        );
        println!("State:      {}", snapshot.state().unwrap().as_ref());
        println!();
    }

    println!();
    println!("Found {} snapshot(s)", length);
    println!();
}
```

```
    Ok(())
}
```

- For API details, see [DescribeSnapshots](#) in *AWS SDK for Rust API reference*.

## Enable monitoring

The following code example shows how to enable monitoring for a running Amazon EC2 instance.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn enable_monitoring(client: &Client, id: &str) -> Result<(), Error> {
    client.monitor_instances().instance_ids(id).send().await?;

    println!("Enabled monitoring");

    Ok(())
}
```

- For API details, see [MonitorInstances](#) in *AWS SDK for Rust API reference*.

## Reboot an instance

    Ok(response)  
}
```

- For API details, see [GetRole](#) in *AWS SDK for Rust API reference*.

## Get the account password policy

The following code example shows how to get the IAM account password policy.

### SDK for Rust

**Note**

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
pub async fn get_account_password_policy(  
    client: &iamClient,  
) -> Result<GetAccountPasswordPolicyOutput, SdkError<GetAccountPasswordPolicyError>> {  
    let response = client.get_account_password_policy().send().await?;  
  
    Ok(response)  
}
```

- For API details, see [GetAccountPasswordPolicy](#) in *AWS SDK for Rust API reference*.

## List SAML providers

The following code example shows how to list SAML providers for IAM.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
pub async fn list_saml_providers(  
    client: &Client,  
) -> Result<ListSamlProvidersOutput, SdkError<ListSAMLProvidersError>> {  
    let response = client.list_saml_providers().send().await?;  
  
    Ok(response)  
}
```

- For API details, see [ListSAMLProviders](#) in *AWS SDK for Rust API reference*.

## List groups

The following code example shows how to list IAM groups.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
pub async fn list_groups(  
    client: &iamClient,  
    path_prefix: Option<String>,  
    marker: Option<String>,  
    max_items: Option<i32>,  
) -> Result<ListGroupsOutput, SdkError<ListGroupsError>> {  
    let response = client
```

```
.list_groups()  
.set_path_prefix(path_prefix)  
.set_marker(marker)  
.set_max_items(max_items)  
.send()  
.await?;  
  
Ok(response)  
}
```

- For API details, see [ListGroups](#) in *AWS SDK for Rust API reference*.

## List inline policies for a role

The following code example shows how to list inline policies for an IAM role.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
pub async fn list_role_policies(  
    client: &iamClient,  
    role_name: &str,  
    marker: Option<String>,  
    max_items: Option<i32>,  
) -> Result<ListRolePoliciesOutput, SdkError<ListRolePoliciesError>> {  
    let response = client  
        .list_role_policies()  
        .role_name(role_name)  
        .set_marker(marker)  
        .set_max_items(max_items)  
        .send()  
        .await?;  
  
    Ok(response)  
}
```

- For API details, see [ListRolePolicies](#) in *AWS SDK for Rust API reference*.

## List policies

The following code example shows how to list IAM policies.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
pub async fn list_policies(
    client: &iamClient,
    path_prefix: Option<String>,
    marker: Option<String>,
    max_items: Option<i32>,
) -> Result<ListPoliciesOutput, SdkError<ListPoliciesError>> {
    let response = client
        .list_policies()
        .set_path_prefix(path_prefix)
        .set_marker(marker)
        .set_max_items(max_items)
        .send()
        .await?;

    Ok(response)
}
```

- For API details, see [ListPolicies](#) in *AWS SDK for Rust API reference*.

## List policies attached to a role

The following code example shows how to list policies attached to an IAM role.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
pub async fn list_attached_role_policies(
    client: &iamClient,
    role_name: String,
    path_prefix: Option<String>,
    marker: Option<String>,
    max_items: Option<i32>,
) -> Result<ListAttachedRolePoliciesOutput, SdkError<ListAttachedRolePoliciesError>> {
    let response = client
        .list_attached_role_policies()
        .role_name(role_name)
        .set_path_prefix(path_prefix)
        .set_marker(marker)
        .set_max_items(max_items)
        .send()
        .await?;

    Ok(response)
}
```

- For API details, see [ListAttachedRolePolicies](#) in *AWS SDK for Rust API reference*.

## List roles

The following code example shows how to list IAM roles.

## SDK for Rust

### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
pub async fn list_roles(
    client: &iamClient,
    path_prefix: Option<String>,
    marker: Option<String>,
    max_items: Option<i32>,
) -> Result<ListRolesOutput, SdkError<ListRolesError>> {
    let response = client
        .list_roles()
        .set_path_prefix(path_prefix)
        .set_marker(marker)
        .set_max_items(max_items)
        .send()
        .await?;
    Ok(response)
}
```

- For API details, see [ListRoles](#) in *AWS SDK for Rust API reference*.

## List users

The following code example shows how to list IAM users.

## SDK for Rust

### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
pub async fn list_users(
    client: &iamClient,
    path_prefix: Option<String>,
    marker: Option<String>,
    max_items: Option<i32>,
) -> Result<ListUsersOutput, SdkError<ListUsersError>> {
    let response = client
        .list_users()
        .set_path_prefix(path_prefix)
        .set_marker(marker)
        .set_max_items(max_items)
        .send()
        .await?;
    Ok(response)
}
```

- For API details, see [ListUsers](#) in *AWS SDK for Rust API reference*.

## Scenarios

### Create a user and assume a role

The following code example shows how to:

- Create a user who has no permissions.
- Create a role that grants permission to list Amazon S3 buckets for the account.
- Add a policy to let the user assume the role.
- Assume the role and list Amazon S3 buckets using temporary credentials.
- Delete the policy, role, and user.

### SDK for Rust

#### Note

## AWS IoT examples using SDK for Rust

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Rust with AWS IoT.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4435\)](#)

## Actions

### Get endpoint information

The following code example shows how to get AWS IoT endpoint information.

#### SDK for Rust

##### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn show_address(client: &Client, endpoint_type: &str) -> Result<(), Error> {
    let resp = client
        .describe_endpoint()
        .endpoint_type(endpoint_type)
        .send()
        .await?;
```

```
    println!("Endpoint address: {}", resp.endpoint_address.unwrap());  
  
    println!();  
  
    Ok(())
}
```

- For API details, see [DescribeEndpoint](#) in *AWS SDK for Rust API reference*.

## List your things

The following code example shows how to list your AWS IoT things.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn show_things(client: &Client) -> Result<(), Error> {
    let resp = client.list_things().send().await?;

    println!("Things:");

    for thing in resp.things.unwrap() {
        println!(
            "  Name: {}",
            thing.thing_name.as_deref().unwrap_or_default()
        );
        println!(
            "  Type: {}",
            thing.thing_type_name.as_deref().unwrap_or_default()
        );
        println!(
            "  ARN: {}",
            thing.thing_arn.as_deref().unwrap_or_default()
        );
        println!();
    }
    println!();
    Ok(())
}
```

- For API details, see [ListThings](#) in *AWS SDK for Rust API reference*.

## AWS KMS examples using SDK for Rust

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Rust with AWS Key Management Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4437\)](#)

## Actions

### Create a key

The following code example shows how to create an AWS KMS key.

#### SDK for Rust

##### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn make_key(client: &Client) -> Result<(), Error> {
    let resp = client.create_key().send().await?;

    let id = resp
        .key_metadata
        .unwrap()
        .key_id
        .unwrap_or_else(|| String::from("No ID!"));

    println!("Key: {}", id);
    Ok(())
}
```

- For API details, see [CreateKey](#) in *AWS SDK for Rust API reference*.

### Create a random byte string

The following code example shows how to create a random byte string that is cryptographically secure using AWS KMS.

#### SDK for Rust

##### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn make_string(client: &Client, length: i32) -> Result<(), Error> {
    let resp = client
        .generate_random()
```

```
.number_of_bytes(length)
.send()
.await?;

// Did we get an encrypted blob?
let blob = resp.plaintext.expect("Could not get encrypted text");
let bytes = blob.as_ref();

let s = base64::encode(bytes);

println!();
println!("Data key:");
println!("{}", s);

Ok(())
}
```

- For API details, see [GenerateRandom](#) in *AWS SDK for Rust API reference*.

## Decrypt ciphertext

The following code example shows how to decrypt ciphertext that was encrypted by a KMS key.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn decrypt_key(client: &Client, key: &str, filename: &str) -> Result<(), Error> {
    // Open input text file and get contents as a string
    // input is a base-64 encoded string, so decode it:
    let data = fs::read_to_string(filename)
        .map(|input| {
            base64::decode(input).expect("Input file does not contain valid base 64
characters.")
        })
        .map(Blob::new);

    let resp = client
        .decrypt()
        .key_id(key)
        .ciphertext_blob(data.unwrap())
        .send()
        .await?;

    let inner = resp.plaintext.unwrap();
    let bytes = inner.as_ref();

    let s = String::from_utf8(bytes.to_vec()).expect("Could not convert to UTF-8");

    println!();
    println!("Decoded string:");
    println!("{}", s);

    Ok(())
}
```

- For API details, see [Decrypt](#) in *AWS SDK for Rust API reference*.

## Encrypt text using a key

The following code example shows how to encrypt text using a KMS key.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn encrypt_string(
    verbose: bool,
    client: &Client,
    text: &str,
    key: &str,
    out_file: &str,
) -> Result<(), Error> {
    let blob = Blob::new(text.as_bytes());

    let resp = client.encrypt().key_id(key).plaintext(blob).send().await?;

    // Did we get an encrypted blob?
    let blob = resp.ciphertext_blob.expect("Could not get encrypted text");
    let bytes = blob.as_ref();

    let s = base64::encode(bytes);

    let mut ofile = File::create(out_file).expect("unable to create file");
    ofile.write_all(s.as_bytes()).expect("unable to write");

    if verbose {
        println!("Wrote the following to {:?}", out_file);
        println!("{}", s);
    }
}

Ok(())
}
```

- For API details, see [Encrypt](#) in *AWS SDK for Rust API reference*.

## Generate a plaintext data key for client-side encryption

The following code example shows how to generate a unique symmetric data key for client-side encryption from an AWS KMS key. The key contains both plaintext and ciphertext versions.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn make_key(client: &Client, key: &str) -> Result<(), Error> {
    let resp = client
        .generate_data_key()
        .key_id(key)
        .key_spec(DataKeySpec::Aes256)
        .send()
        .await?;

    // Did we get an encrypted blob?
    let blob = resp.ciphertext_blob.expect("Could not get encrypted text");
    let bytes = blob.as_ref();

    let s = base64::encode(bytes);

    println!();
    println!("Data key:");
    println!("{}", s);

    Ok(())
}
```

- For API details, see [GenerateDataKey](#) in *AWS SDK for Rust API reference*.

## Generate an encrypted data key

The following code example shows how to generate an encrypted data key from an AWS KMS key. The key contains only a ciphertext version.

### SDK for Rust

**Note**

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn make_key(client: &Client, key: &str) -> Result<(), Error> {
    let resp = client
        .generate_data_key_without_plaintext()
        .key_id(key)
        .key_spec(DataKeySpec::Aes256)
        .send()
        .await?;

    // Did we get an encrypted blob?
    let blob = resp.ciphertext_blob.expect("Could not get encrypted text");
    let bytes = blob.as_ref();

    let s = base64::encode(bytes);

    println!();
    println!("Data key:");
    println!("{}", s);
```

```
        Ok(())
}
```

## List keys

The following code example shows how to list KMS keys.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn show_keys(client: &Client) -> Result<(), Error> {
    let resp = client.list_keys().send().await?;

    let keys = resp.keys.unwrap_or_default();

    let len = keys.len();

    for key in keys {
        println!("Key ARN: {}", key.key_arn.as_deref().unwrap_or_default());
    }

    println!();
    println!("Found {} keys", len);

    Ok(())
}
```

- For API details, see [ListKeys](#) in *AWS SDK for Rust API reference*.

## Recrypt ciphertext from one key to another

The following code example shows how to reencrypt ciphertext from one KMS key to another.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn reencrypt_string(
    verbose: bool,
    client: &Client,
```

```
    input_file: &str,
    output_file: &str,
    first_key: &str,
    new_key: &str,
) -> Result<(), Error> {
    // Get blob from input file
    // Open input text file and get contents as a string
    // input is a base-64 encoded string, so decode it:
    let data = fs::read_to_string(input_file)
        .map(|input_file| base64::decode(input_file).expect("invalid base 64"))
        .map(Blob::new);

    let resp = client
        .re_encrypt()
        .ciphertext_blob(data.unwrap())
        .source_key_id(first_key)
        .destination_key_id(new_key)
        .send()
        .await?;

    // Did we get an encrypted blob?
    let blob = resp.ciphertext_blob.expect("Could not get encrypted text");
    let bytes = blob.as_ref();

    let s = base64::encode(bytes);
    let o = &output_file;

    let mut ofile = File::create(o).expect("unable to create file");
    ofile.write_all(s.as_bytes()).expect("unable to write");

    if verbose {
        println!("Wrote the following to {}:", output_file);
        println!("{}", s);
    } else {
        println!("Wrote base64-encoded output to {}", output_file);
    }
}

Ok(())
}
```

- For API details, see [ReEncrypt](#) in *AWS SDK for Rust API reference*.

## Kinesis examples using SDK for Rust

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Rust with Amazon Kinesis.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

## Actions

### Create a stream

The following code example shows how to create a Kinesis stream.

## SDK for Rust

### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn make_stream(client: &Client, stream: &str) -> Result<(), Error> {
    client
        .create_stream()
        .stream_name(stream)
        .shard_count(4)
        .send()
        .await?;

    println!("Created stream");

    Ok(())
}
```

- For API details, see [CreateStream](#) in *AWS SDK for Rust API reference*.

## Delete a stream

The following code example shows how to delete a Kinesis stream.

## SDK for Rust

### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn remove_stream(client: &Client, stream: &str) -> Result<(), Error> {
    client.delete_stream().stream_name(stream).send().await?;

    println!("Deleted stream.");

    Ok(())
}
```

- For API details, see [DeleteStream](#) in *AWS SDK for Rust API reference*.

## Describe a stream

The following code example shows how to describe a Kinesis stream.

## SDK for Rust

### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn show_stream(client: &Client, stream: &str) -> Result<(), Error> {
    let resp = client.describe_stream().stream_name(stream).send().await?;

    let desc = resp.stream_description.unwrap();

    println!("Stream description:");
    println!("  Name:          {}", desc.stream_name.unwrap());
    println!("  Status:        {:?}", desc.stream_status.unwrap());
    println!("  Open shards:   {:?}", desc.shards.unwrap().len());
    println!(
        "  Retention (hours): {}",
        desc.retention_period_hours.unwrap()
    );
    println!("  Encryption:    {:?}", desc.encryption_type.unwrap());

    Ok(())
}
```

- For API details, see [DescribeStream in AWS SDK for Rust API reference](#).

## List streams

The following code example shows how to list information about one or more Kinesis streams.

### SDK for Rust

**Note**

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn show_streams(client: &Client) -> Result<(), Error> {
    let resp = client.list_streams().send().await?;

    println!("Stream names:");

    let streams = resp.stream_names.unwrap_or_default();
    for stream in &streams {
        println!("  {}", stream);
    }

    println!("Found {} stream(s)", streams.len());

    Ok(())
}
```

- For API details, see [ListStreams in AWS SDK for Rust API reference](#).

## Put data into a stream

The following code example shows how to put data into a Kinesis stream.

## SDK for Rust

### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn add_record(client: &Client, stream: &str, key: &str, data: &str) -> Result<(),  
Error> {  
    let blob = Blob::new(data);  
  
    client  
        .put_record()  
        .data(blob)  
        .partition_key(key)  
        .stream_name(stream)  
        .send()  
        .await?;  
  
    println!("Put data into stream.");  
  
    Ok(())
}
```

- For API details, see [PutRecord](#) in *AWS SDK for Rust API reference*.

## MediaLive examples using SDK for Rust

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Rust with AWS Elemental MediaLive.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

## Create a multipart upload

The following code example shows how to create the structure to build a multipart upload action.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
let multipart_upload_res: CreateMultipartUploadOutput = client
    .create_multipart_upload()
    .bucket(&bucket_name)
    .key(&key)
    .send()
    .await
    .unwrap();
```

- For API details, see [CreateMultipartUpload](#) in *AWS SDK for Rust API reference*.

## Delete an empty bucket

The following code example shows how to delete an empty S3 bucket.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
pub async fn delete_bucket(client: &Client, bucket_name: &str) -> Result<(), Error> {
    client.delete_bucket().bucket(bucket_name).send().await?;
    println!("Bucket deleted");
    Ok(())
}
```

- For API details, see [DeleteBucket](#) in *AWS SDK for Rust API reference*.

## Delete an object

The following code example shows how to delete an S3 object.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn remove_object(client: &Client, bucket: &str, key: &str) -> Result<(), Error> {
    client
        .delete_object()
        .bucket(bucket)
        .key(key)
        .send()
        .await?;

    println!("Object deleted.");
    Ok(())
}
```

- For API details, see [DeleteObject](#) in *AWS SDK for Rust API reference*.

## Delete multiple objects

The following code example shows how to delete multiple objects from an S3 bucket.

### SDK for Rust

**Note**

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
pub async fn delete_objects(client: &Client, bucket_name: &str) -> Result<(), Error> {
    let objects = client.list_objects_v2().bucket(bucket_name).send().await?;

    let mut delete_objects: Vec<ObjectIdentifier> = vec![];
    for obj in objects.contents().unwrap_or_default() {
        let obj_id = ObjectIdentifier::builder()
            .set_key(Some(obj.key().unwrap().to_string()))
            .build();
        delete_objects.push(obj_id);
    }
    client
        .delete_objects()
        .bucket(bucket_name)
        .delete(Delete::builder().set_objects(Some(delete_objects)).build())
        .send()
        .await?;

    let objects: ListObjectsV2Output =
        client.list_objects_v2().bucket(bucket_name).send().await?;
    match objects.key_count {
        0 => Ok(()),
        _ => Err(Error::Unhandled(Box::from(
            "There were still objects left in the bucket.",
        ))),
    }
}
```

- For API details, see [DeleteObjects](#) in *AWS SDK for Rust API reference*.

## Get an object from a bucket

The following code example shows how to read data from an object in an S3 bucket.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
pub async fn download_object(client: &Client, bucket_name: &str, key: &str) ->
    GetObjectOutput {
    let resp = client
        .get_object()
        .bucket(bucket_name)
        .key(key)
        .send()
        .await;
    resp.unwrap()
}
```

- For API details, see [GetObject](#) in *AWS SDK for Rust API reference*.

## Get the Region location for a bucket

The following code example shows how to get the Region location for an S3 bucket.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn show_buckets(strict: bool, client: &Client, region: &str) -> Result<(), Error> {
    let resp = client.list_buckets().send().await?;
    let buckets = resp.buckets().unwrap_or_default();
    let num_buckets = buckets.len();

    let mut in_region = 0;

    for bucket in buckets {
        if strict {
            let r = client
                .get_bucket_location()
                .bucket(bucket.name().unwrap_or_default())
                .send()
```

```
.await?;

    if r.location_constraint().unwrap().as_ref() == region {
        println!("{}", bucket.name().unwrap_or_default());
        in_region += 1;
    }
} else {
    println!("{}", bucket.name().unwrap_or_default());
}
}

println!();
if strict {
    println!(
        "Found {} buckets in the {} region out of a total of {} buckets.",
        in_region, region, num_buckets
    );
} else {
    println!("Found {} buckets in all regions.", num_buckets);
}

Ok(())
}
```

- For API details, see [GetBucketLocation](#) in *AWS SDK for Rust API reference*.

## List buckets

The following code example shows how to list S3 buckets.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn show_buckets(strict: bool, client: &Client, region: &str) -> Result<(), Error> {
    let resp = client.list_buckets().send().await?;

## Upload an object to a bucket

The following code example shows how to upload an object to an S3 bucket.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
pub async fn upload_object(
    client: &Client,
    bucket_name: &str,
    file_name: &str,
    key: &str,
) -> Result<(), Error> {
    let body = ByteStream::from_path(Path::new(file_name)).await;
    client
        .put_object()
        .bucket(bucket_name)
        .key(key)
        .body(body.unwrap())
        .send()
        .await?;

    println!("Uploaded file: {}", file_name);
    Ok(())
}
```

- For API details, see [PutObject](#) in *AWS SDK for Rust API reference*.

## Scenarios

### Get started with buckets and objects

The following code example shows how to:

- Create a bucket.
- Upload a file to the bucket.
- Download an object from a bucket.
- Copy an object to a subfolder in a bucket.
- List the objects in a bucket.
- Delete the objects in a bucket.
- Delete a bucket.

### SDK for Rust

**Note**

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Code for the binary crate which runs the scenario.

```
use aws_config::meta::region::RegionProviderChain;
use aws_sdk_s3::{Client, Error, Region};
```

```

use uuid::Uuid;

#[tokio::main]
async fn main() -> Result<(), Error> {
    let (region, client, bucket_name, file_name, key, target_key) =
initialize_variables().await;

    if let Err(e) = run_s3_operations(region, client, bucket_name, file_name, key,
target_key).await
    {
        println!("{}:{}", e);
    };

    Ok(())
}

async fn initialize_variables() -> (Region, Client, String, String, String, String) {
    let region_provider = RegionProviderChain::first_try(Region::new("us-west-2"));
    let region = region_provider.region().await.unwrap();

    let shared_config = aws_config::from_env().region(region_provider).load().await;
    let client = Client::new(&shared_config);

    let bucket_name = format!("doc-example-bucket-{}", Uuid::new_v4());

    let file_name = "s3/testfile.txt".to_string();
    let key = "test file key name".to_string();

```

## Amazon SES API v2 examples using SDK for Rust

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Rust with Amazon Simple Email Service API v2.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4468\)](#)

## Actions

### Create a contact in a contact list

The following code example shows how to create an Amazon SES API v2 contact in a contact list.

#### SDK for Rust

##### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn add_contact(client: &Client, list: &str, email: &str) -> Result<(), Error> {
    client
        .create_contact()
        .contact_list_name(list)
        .email_address(email)
        .send()
        .await?;
```

```
    println!("Created contact");

    Ok(())
}
```

- For API details, see [CreateContact](#) in *AWS SDK for Rust API reference*.

## Create a contact list

The following code example shows how to create an Amazon SES API v2 contact list.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn make_list(client: &Client, contact_list: &str) -> Result<(), Error> {
    client
        .create_contact_list()
        .contact_list_name(contact_list)
        .send()
        .await?;

    println!("Created contact list.");

    Ok(())
}
```

- For API details, see [CreateContactList](#) in *AWS SDK for Rust API reference*.

## Get identity information

The following code example shows how to get Amazon SES API v2 identity information.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Determines whether an email address has been verified.

```
async fn is_verified(client: &Client, email: &str) -> Result<(), Error> {
    let resp = client
        .get_email_identity()
        .email_identity(email)
        .send()
```

```
.await?;

if resp.verified_for_sending_status() {
    println!("The address is verified");
} else {
    println!("The address is not verified");
}

Ok(())
}
```

- For API details, see [GetEmailIdentity](#) in *AWS SDK for Rust API reference*.

## List the contact lists

The following code example shows how to list the Amazon SES API v2 contact lists.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn show_lists(client: &Client) -> Result<(), Error> {
    let resp = client.list_contact_lists().send().await?;

    println!("Contact lists:");

    for list in resp.contact_lists().unwrap_or_default() {
        println!("  {}", list.contact_list_name().unwrap_or_default());
    }

    Ok(())
}
```

- For API details, see [ListContactLists](#) in *AWS SDK for Rust API reference*.

## List the contacts in a contact list

The following code example shows how to list the contacts in an Amazon SES API v2 contact list.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn show_contacts(client: &Client, list: &str) -> Result<(), Error> {
```

```
let resp = client
    .list_contacts()
    .contact_list_name(list)
    .send()
    .await?;

println!("Contacts:");

for contact in resp.contacts().unwrap_or_default() {
    println!("  {}", contact.email_address().unwrap_or_default());
}

Ok(())
}
```

- For API details, see [ListContacts](#) in *AWS SDK for Rust API reference*.

## Send an email

The following code example shows how to send an Amazon SES API v2 email.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Sends a message to all members of the contact list.

```
async fn send_message(
    client: &Client,
    list: &str,
    from: &str,
    subject: &str,
    message: &str,
) -> Result<(), Error> {
    // Get list of email addresses from contact list.
    let resp = client
        .list_contacts()
        .contact_list_name(list)
        .send()
        .await?;

    let contacts = resp.contacts().unwrap_or_default();

    let cs: String = contacts
        .iter()
        .map(|i| i.email_address().unwrap_or_default())
        .collect();

    let dest = Destination::builder().to_addresses(cs).build();
    let subject_content = Content::builder().data(subject).charset("UTF-8").build();
    let body_content = Content::builder().data(message).charset("UTF-8").build();
    let body = Body::builder().text(body_content).build();

    let msg = Message::builder()
        .subject(subject_content)
        .body(body)
```

```
.build();

let email_content = EmailContent::builder().simple(msg).build();

client
    .send_email()
    .from_email_address(from)
    .destination(dest)
    .content(email_content)
    .send()
    .await?;

println!("Email sent to list");

Ok(())
}
```

- For API details, see [SendEmail](#) in *AWS SDK for Rust API reference*.

## Amazon SNS examples using SDK for Rust

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Rust with Amazon Simple Notification Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4472\)](#)

## Actions

### Create a topic

The following code example shows how to create an Amazon SNS topic.

#### SDK for Rust

##### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn make_topic(client: &Client, topic_name: &str) -> Result<(), Error> {
    let resp = client.create_topic().name(topic_name).send().await?;

    println!(
        "Created topic with ARN: {}",
        resp.topic_arn().unwrap_or_default()
    );
}

Ok(())
}
```

- For API details, see [CreateTopic](#) in *AWS SDK for Rust API reference*.

## List topics

The following code example shows how to list Amazon SNS topics.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn show_topics(client: &Client) -> Result<(), Error> {
    let resp = client.list_topics().send().await?;

    println!("Topic ARNs:");

    for topic in resp.topics().unwrap_or_default() {
        println!("{}", topic.topic_arn().unwrap_or_default());
    }

    Ok(())
}
```

- For API details, see [ListTopics](#) in *AWS SDK for Rust API reference*.

## Publish to a topic

The following code example shows how to publish messages to an Amazon SNS topic.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn subscribe_and_publish(
    client: &Client,
    topic_arn: &str,
    email_address: &str,
) -> Result<(), Error> {
    println!("Receiving on topic with ARN: `{}'", topic_arn);

    let rsp = client
        .subscribe()
        .topic_arn(topic_arn)
        .protocol("email")
        .endpoint(email_address)
        .send()
```

```
.await?;

println!("Added a subscription: {:?}", rsp);

let rsp = client
.publish()
.topic_arn(topic_arn)
.message("hello sns!")
.send()
.await?;

println!("Published message: {:?}", rsp);

Ok(())
}
```

- For API details, see [Publish](#) in *AWS SDK for Rust API reference*.

## Subscribe an email address to a topic

The following code example shows how to subscribe an email address to an Amazon SNS topic.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn subscribe_and_publish(
    client: &Client,
    topic_arn: &str,
    email_address: &str,
) -> Result<(), Error> {
    println!("Receiving on topic with ARN: `{}`, topic_arn");

    let rsp = client
        .subscribe()
        .topic_arn(topic_arn)
        .protocol("email")
        .endpoint(email_address)
        .send()
        .await?;

    println!("Added a subscription: {:?}", rsp);

    let rsp = client
        .publish()
        .topic_arn(topic_arn)
        .message("hello sns!")
        .send()
        .await?;

    println!("Published message: {:?}", rsp);

    Ok(())
}
```

- For API details, see [Subscribe](#) in *AWS SDK for Rust API reference*.

## Amazon SQS examples using SDK for Rust

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Rust with Amazon Simple Queue Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4475\)](#)

## Actions

### List queues

The following code example shows how to list Amazon SQS queues.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Retrieve the first Amazon SQS queue listed in the Region.

```
async fn find_first_queue(client: &Client) -> Result<String, Error> {
    let queues = client.list_queues().send().await?;
    let queue_urls = queues.queue_urls().unwrap_or_default();
    Ok(queue_urls
        .first()
        .expect("No queues in this account and Region. Create a queue to proceed.")
        .to_string())
}
```

- For API details, see [ListQueues](#) in *AWS SDK for Rust API reference*.

### Receive messages from a queue

The following code example shows how to receive messages from an Amazon SQS queue.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn receive(client: &Client, queue_url: &String) -> Result<(), Error> {
    let rcv_message_output =
        client.receive_message().queue_url(queue_url).send().await?;

    println!("Messages from queue with url: {}", queue_url);

    for message in rcv_message_output.messages.unwrap_or_default() {
        println!("Got the message: {:?}", message);
    }

    Ok(())
}
```

- For API details, see [ReceiveMessage in AWS SDK for Rust API reference](#).

## Send a message to a queue

The following code example shows how to send a message to an Amazon SQS queue.

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn send(client: &Client, queue_url: &String, message: &SQSMessage) -> Result<(), Error> {
    println!("Sending message to queue with URL: {}", queue_url);

    let rsp = client
        .send_message()
        .queue_url(queue_url)
        .message_body(&message.body)
        .message_group_id(&message.group)
        // If the queue is FIFO, you need to set .message_deduplication_id
        // or configure the queue for ContentBasedDeduplication.
        .send()
        .await?;

    println!("Send message to the queue: {:?}", rsp);

    Ok(())
}
```

- For API details, see [SendMessage in AWS SDK for Rust API reference](#).

## SageMaker examples using SDK for Rust

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Rust with Amazon SageMaker.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn show_parameters(client: &Client) -> Result<(), Error> {  
    let resp = client.describe_parameters().send().await?;  
  
    for param in resp.parameters().unwrap().iter() {  
        println!("  {}", param.name().unwrap_or_default());  
    }  
  
    Ok(())  
}
```

- For API details, see [DescribeParameters](#) in *AWS SDK for Rust API reference*.

## Cross-service examples using SDK for Rust

The following sample applications use the AWS SDK for Rust to work across multiple AWS services.

### Examples

- [Convert text to speech and back to text using an AWS SDK \(p. 4481\)](#)
- [Detect faces in an image using an AWS SDK \(p. 4482\)](#)
- [Save EXIF and other image information using an AWS SDK \(p. 4482\)](#)

## Convert text to speech and back to text using an AWS SDK

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

Use Amazon Polly to synthesize a plain text (UTF-8) input file to an audio file, upload the audio file to an Amazon Simple Storage Service bucket, use Amazon Transcribe to convert that audio file to text, and display the text.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Polly
- Amazon S3
- Amazon Transcribe

## Detect faces in an image using an AWS SDK

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

Save the image in an Amazon Simple Storage Service bucket with an **uploads** prefix, use Amazon Rekognition to detect facial details, such as age range, gender, and emotion (smiling, etc.), and display those details.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Rekognition
- Amazon S3

## Save EXIF and other image information using an AWS SDK

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

Get EXIF information from a JPG, JPEG, or PNG file, upload the image file to an Amazon Simple Storage Service bucket, use Amazon Rekognition to identify the three top attributes (*labels* in Amazon Rekognition) in the file, and add the EXIF and label information to a Amazon DynamoDB table in the Region.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- DynamoDB
- Amazon Rekognition
- Amazon S3

## Code examples for SDK for SAP ABAP

The code examples in this topic show you how to use the AWS SDK for SAP ABAP with AWS.

## Delete alarms

The following code example shows how to delete Amazon CloudWatch alarms.

### SDK for SAP ABAP

#### Note

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
TRY.  
    lo_cwt->deletealarms(  
        it_alarmnames = it_alarm_names  
    ).  
    MESSAGE 'Alarms deleted' TYPE 'I'.  
    CATCH /aws1/cx_cwtresourcenotfound .  
        MESSAGE 'Resource being access is not found.' TYPE 'E'.  
    ENDTRY.
```

- For API details, see [DeleteAlarms](#) in *AWS SDK for SAP ABAP API reference*.

## Describe alarms

The following code example shows how to describe Amazon CloudWatch alarms.

### SDK for SAP ABAP

#### Note

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
TRY.  
    oo_result = lo_cwt->describealarms(                                " oo_result is returned for  
testing purpose "  
        it_alarmnames = it_alarm_names  
    ).  
    MESSAGE 'Alarms retrieved' TYPE 'I'.  
    CATCH /aws1/cx_rt_service_generic INTO DATA(lo_exception).  
        DATA(lv_error) = |"{ lo_exception->av_err_code }" - { lo_exception-  
>av_err_msg }|.  
        MESSAGE lv_error TYPE 'E'.  
    ENDTRY.
```

- For API details, see [DescribeAlarms in AWS SDK for SAP ABAP API reference](#).

## Disable alarm actions

The following code example shows how to disable Amazon CloudWatch alarm actions.

### SDK for SAP ABAP

**Note**

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
"Disables actions on the specified alarm. "  
TRY.  
    lo_cwt->disablealarmactions(  
        it_alarmnames = it_alarm_names  
    ).  
    MESSAGE 'Alarm actions disabled' TYPE 'I'.  
    CATCH /aws1/cx_rt_service_generic INTO DATA(lo_exception).  
        DATA(lv_error) = |"{ lo_exception->av_err_code }" - { lo_exception-  
>av_err_msg }|.  
        MESSAGE lv_error TYPE 'E'.  
    ENDTRY.
```

- For API details, see [DisableAlarmActions in AWS SDK for SAP ABAP API reference](#).

## Enable alarm actions

The following code example shows how to enable Amazon CloudWatch alarm actions.

### SDK for SAP ABAP

**Note**

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
"Enable actions on the specified alarm."  
TRY.  
    lo_cwt->enablealarmactions(  
        it_alarmnames = it_alarm_names  
    ).  
    MESSAGE 'Alarm actions enabled' TYPE 'I'.  
    CATCH /aws1/cx_rt_service_generic INTO DATA(lo_exception).  
        DATA(lv_error) = |"{ lo_exception->av_err_code }" - { lo_exception->av_err_msg }|.  
        MESSAGE lv_error TYPE 'E'.  
    ENDTRY.
```

- For API details, see [EnableAlarmActions](#) in *AWS SDK for SAP ABAP API reference*.

## List metrics

The following code example shows how to list Amazon CloudWatch metrics.

### SDK for SAP ABAP

**Note**

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```

## Amazon EC2 examples using SDK for SAP ABAP

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for SAP ABAP with Amazon Elastic Compute Cloud.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4488\)](#)

## Actions

### Allocate an Elastic IP address

The following code example shows how to allocate an Elastic IP address for Amazon EC2.

#### SDK for SAP ABAP

##### Note

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
TRY.
    oo_result = lo_ec2->allocateaddress( iv_domain = 'vpc' ).    " oo_result is
    returned for testing purpose "
    MESSAGE 'Allocated an Elastic IP address' TYPE 'I'.
    CATCH /aws1/cx_rt_service_generic INTO DATA(lo_exception).
    DATA(lv_error) = "|{" lo_exception->av_err_code }" - { lo_exception-
    >av_err_msg }|.
    MESSAGE lv_error TYPE 'E'.
```

```
ENDTRY.
```

- For API details, see [AllocateAddress in AWS SDK for SAP ABAP API reference](#).

## Associate an Elastic IP address with an instance

The following code example shows how to associate an Elastic IP address with an Amazon EC2 instance.

### SDK for SAP ABAP

#### Note

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
TRY.  
    oo_result = lo_ec2->associateaddress(                                     " oo_result is  
    returned for testing purpose "  
        iv_allocationid = iv_allocation_id  
        iv_instanceid = iv_instance_id  
    ).  
    MESSAGE 'Associated Elastic IP address with an EC2 instance' TYPE 'I'.  
    CATCH /aws1/cx_rt_service_generic INTO DATA(lo_exception).  
        DATA(lv_error) = |" { lo_exception->av_err_code }" - { lo_exception-  
        >av_err_msg }|.  
        MESSAGE lv_error TYPE 'E'.  
    ENDTRY.
```

- For API details, see [AssociateAddress in AWS SDK for SAP ABAP API reference](#).

## Create a security group

The following code example shows how to create an Amazon EC2 security group.

### SDK for SAP ABAP

#### Note

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

#### Note

## Kinesis examples using SDK for SAP ABAP

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for SAP ABAP with Amazon Kinesis.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4499\)](#)
- [Scenarios \(p. 4503\)](#)

## Actions

### Create a stream

The following code example shows how to create a Kinesis stream.

#### SDK for SAP ABAP

##### Note

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
TRY.
lo_kns->createstream(
    iv_streamname = iv_stream_name
    iv_shardcount = iv_shard_count
).
MESSAGE 'Stream created' TYPE 'I'.
CATCH /aws1/cx_knsinvalidargumentex.
MESSAGE 'The specified argument was not valid.' TYPE 'E'.
```

```
CATCH /aws1/cx_knslimitexceededex .
MESSAGE 'The request processing has failed because of a limit exceed
exception.' TYPE 'E'.
CATCH /aws1/cx_knsresourceinuseex .
MESSAGE 'The request processing has failed because the resource is in use.'
TYPE 'E'.
ENDTRY.
```

- For API details, see [CreateStream](#) in *AWS SDK for SAP ABAP API reference*.

## Delete a stream

The following code example shows how to delete a Kinesis stream.

### SDK for SAP ABAP

#### Note

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
TRY.
  lo_kns->deletestream(
    iv_streamname = iv_stream_name
  ).
  MESSAGE 'Stream deleted' TYPE 'I'.
CATCH /aws1/cx_knslimitexceededex .
  MESSAGE 'The request processing has failed because of a limit exceed
exception.' TYPE 'E'.
CATCH /aws1/cx_knsresourceinuseex .
  MESSAGE 'The request processing has failed because the resource is in use.'
TYPE 'E'.
ENDTRY.
```

- For API details, see [DeleteStream](#) in *AWS SDK for SAP ABAP API reference*.

## Describe a stream

The following code example shows how to describe a Kinesis stream.

### SDK for SAP ABAP

#### Note

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```

## Lambda examples using SDK for SAP ABAP

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for SAP ABAP with AWS Lambda.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4506\)](#)
- [Scenarios \(p. 4511\)](#)

## Actions

### Create a function

The following code example shows how to create a Lambda function.

### SDK for SAP ABAP

#### Note

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
TRY.
```

```
lo_lmd->createfunction(
    iv_functionname = iv_function_name
    iv_runtime = `python3.9`
    iv_role = iv_role_arn
    iv_handler = iv_handler
    io_code = io_zip_file
    iv_description = 'AWS Lambda code example'
).
MESSAGE 'Lambda function created' TYPE 'I'.

    ENDTRY.
```

- For API details, see [UpdateFunctionConfiguration](#) in *AWS SDK for SAP ABAP API reference*.

## Scenarios

### Get started with functions

The following code example shows how to:

- Create an AWS Identity and Access Management (IAM) role that grants Lambda permission to write to logs.
- Create a Lambda function and upload handler code.
- Invoke the function with a single parameter and get results.
- Update the function code and configure its Lambda environment with an environment variable.
- Invoke the function with new parameters and get results. Display the execution log that's returned from the invocation.
- List the functions for your account.
- Delete the IAM role and the Lambda function.

For more information, see [Create a Lambda function with the console](#).

## Amazon S3 examples using SDK for SAP ABAP

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for SAP ABAP with Amazon Simple Storage Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4516\)](#)
- [Scenarios \(p. 4519\)](#)

## Actions

### [Copy an object from one bucket to another](#)

The following code example shows how to copy an S3 object from one bucket to another.

#### SDK for SAP ABAP

##### Note

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
TRY.  
    lo_s3->copyobject(  
        iv_bucket = iv_dest_bucket  
        iv_key = iv_dest_object  
        iv_copysource = |{ iv_src_bucket }/{ iv_src_object }|  
    ).  
    MESSAGE 'Object copied to another bucket' TYPE 'I'.  
    CATCH /aws1/cx_s3_nosuchbucket.  
        MESSAGE 'Bucket does not exist' TYPE 'E'.  
    CATCH /aws1/cx_s3_nosuchkey.  
        MESSAGE 'Object key does not exist' TYPE 'E'.  
    ENDTRY.
```

- For API details, see [CopyObject](#) in *AWS SDK for SAP ABAP API reference*.

## Create a bucket

The following code example shows how to create an S3 bucket.

#### SDK for SAP ABAP

##### Note

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
TRY.  
    lo_s3->createbucket(  
        iv_bucket = iv_bucket_name  
    ).  
    MESSAGE 'S3 bucket created' TYPE 'I'.  
CATCH /aws1/cx_s3_bucketalrdyexists.  
    MESSAGE 'Bucket name already exists' TYPE 'E'.  
CATCH /aws1/cx_s3_bktalrdyownedbyyou.  
    MESSAGE 'Bucket already exist and is owned by you' TYPE 'E'.  
ENDTRY.
```

- For API details, see [CreateBucket](#) in *AWS SDK for SAP ABAP API reference*.

## Delete an empty bucket

The following code example shows how to delete an empty S3 bucket.

### SDK for SAP ABAP

**Note**

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
TRY.  
    lo_s3->deletebucket(  
        iv_bucket = iv_bucket_name  
    ).  
    MESSAGE 'Deleted S3 bucket' TYPE 'I'.  
CATCH /aws1/cx_s3_nosuchbucket.  
    MESSAGE 'Bucket does not exist' TYPE 'E'.  
ENDTRY.
```

- For API details, see [DeleteBucket](#) in *AWS SDK for SAP ABAP API reference*.

## Delete an object

The following code example shows how to delete an S3 object.

### SDK for SAP ABAP

**Note**

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
TRY.  
    lo_s3->deleteobject(  
        iv_bucket = iv_bucket_name  
        iv_key = iv_object_key  
    ).  
    MESSAGE 'Object deleted from S3 bucket' TYPE 'I'.  
CATCH /aws1/cx_s3_nosuchbucket.  
    MESSAGE 'Bucket does not exist' TYPE 'E'.  
ENDTRY.
```

- For API details, see [DeleteObject](#) in *AWS SDK for SAP ABAP API reference*.

## Get an object from a bucket

The following code example shows how to read data from an object in an S3 bucket.

### SDK for SAP ABAP

#### Note

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
TRY.  
    oo_result = lo_s3->getobject(          " oo_result is returned for testing  
purpose "  
        iv_bucket = iv_bucket_name  
        iv_key = iv_object_key  
    ).  
    DATA(lv_object_data) = oo_result->get_body( ).  
    MESSAGE 'Object retrieved from S3 bucket' TYPE 'I'.  
CATCH /aws1/cx_s3_nosuchbucket.  
    MESSAGE 'Bucket does not exist' TYPE 'E'.  
CATCH /aws1/cx_s3_nosuchkey.  
    MESSAGE 'Object key does not exist' TYPE 'E'.  
ENDTRY.
```

- For API details, see [GetObject](#) in *AWS SDK for SAP ABAP API reference*.

## List objects in a bucket

The following code example shows how to list objects in an S3 bucket.

### SDK for SAP ABAP

#### Note

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
TRY.  
    oo_result = lo_s3->listobjects(           " oo_result is returned for testing  
purpose "  
        iv_bucket = iv_bucket_name  
    ).  
    MESSAGE 'Retrieved list of object(s) in S3 bucket' TYPE 'I'.  
CATCH /aws1/cx_s3_nosuchbucket.  
    MESSAGE 'Bucket does not exist' TYPE 'E'.  
ENDTRY.
```

- For API details, see [ListObjects](#) in *AWS SDK for SAP ABAP API reference*.

## Upload an object to a bucket

The following code example shows how to upload an object to an S3 bucket.

### SDK for SAP ABAP

#### Note

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
"Get contents of file from application server"  
DATA lv_body TYPE xstring.  
OPEN DATASET iv_file_name FOR INPUT IN BINARY MODE.  
READ DATASET iv_file_name INTO lv_body.  
CLOSE DATASET iv_file_name.  
  
"Upload/Put an object to S3 bucket"  
TRY.  
    lo_s3->putobject(  
        iv_bucket = iv_bucket_name  
        iv_key = iv_file_name  
        iv_body = lv_body  
    ).  
    MESSAGE 'Object uploaded to S3 bucket' TYPE 'I'.  
CATCH /aws1/cx_s3_nosuchbucket.  
    MESSAGE 'Bucket does not exist' TYPE 'E'.  
ENDTRY.
```

- For API details, see [PutObject](#) in *AWS SDK for SAP ABAP API reference*.

## Scenarios

### Get started with buckets and objects

The following code example shows how to:

- Create a bucket.
- Upload a file to the bucket.

- Download an object from a bucket.
- Copy an object to a subfolder in a bucket.
- List the objects in a bucket.
- Delete the objects in a bucket.
- Delete a bucket.

## Actions

### Create a topic

The following code example shows how to create an Amazon SNS topic.

#### SDK for SAP ABAP

##### Note

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
TRY.  
    oo_result = lo_sns->createtopic( iv_name = iv_topic_name ). " oo_result is  
    returned for testing purpose "  
    MESSAGE 'SNS topic created' TYPE 'I'.  
    CATCH /aws1/cx_snstopiclimitecdex.  
        MESSAGE 'Unable to create more topics as you have reached the maximum number of  
        topics allowed.' TYPE 'E'.  
    ENDTRY.
```

- For API details, see [CreateTopic](#) in *AWS SDK for SAP ABAP API reference*.

### Delete a subscription

The following code example shows how to delete an Amazon SNS subscription.

#### SDK for SAP ABAP

##### Note

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
TRY.  
    lo_sns->unsubscribe( iv_subscriptionarn = iv_subscription_arn ).  
    MESSAGE 'Subscription Deleted' TYPE 'I'.  
    CATCH /aws1/cx_snsnotfoundexception.  
        MESSAGE 'Subscription does not exist' TYPE 'E'.  
    CATCH /aws1/cx_snsinvalidparameterex.  
        MESSAGE 'Subscription with "PendingConfirmation" status cannot be deleted/  
unsubscribed, subscription should be confirmed before perform unsubscribe operation'  
        TYPE 'E'.  
    ENDTRY.
```

- For API details, see [Unsubscribe](#) in *AWS SDK for SAP ABAP API reference*.

## Delete a topic

The following code example shows how to delete an Amazon SNS topic and all subscriptions to that topic.

### SDK for SAP ABAP

**Note**

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
TRY.  
    lo_sns->deletetopic( iv_topicarn = iv_topic_arn ).  
    MESSAGE 'SNS topic deleted' TYPE 'I'.

## Amazon SQS examples using SDK for SAP ABAP

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for SAP ABAP with Amazon Simple Queue Service.

**Actions** are code excerpts that show you how to call individual service functions.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4528\)](#)

## Actions

### Create a queue

The following code example shows how to create an Amazon SQS queue.

#### SDK for SAP ABAP

##### Note

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create an Amazon SQS standard queue.

```
TRY.  
    oo_result = lo_sqs->createqueue( iv_queuename = iv_queue_name ).           "  
oo_result is returned for testing purpose "  
    MESSAGE 'SQS queue created' TYPE 'I'.  
    CATCH /aws1/cx_sqssqueuedeldrecently.  
        MESSAGE 'After deleting a queue, you should wait 60 seconds before creating  
another queue with the same name.' TYPE 'E'.  
        CATCH /aws1/cx_sqssqueuenameexists.  
            MESSAGE 'A queue with this name already exists.' TYPE 'E'.  
        ENDTRY.
```

Create an Amazon SQS queue that waits for a message to arrive.

```
TRY.  
    DATA lt_attributes TYPE /aws1/cl_sqssqueueattrmap_w=>tt_queueattributemap.  
    DATA ls_attribute TYPE /aws1/cl_sqssqueueattrmap_w=>ts_queueattributemap_maprow.  
    ls_attribute-key = 'ReceiveMessageWaitTimeSeconds'.                      " time in  
seconds for long polling i.e. time for which the call waits for a message to arrive in  
queue before returning"  
    ls_attribute-value = NEW /aws1/cl_sqssqueueattrmap_w( iv_value = iv_wait_time ).  
    INSERT ls_attribute INTO TABLE lt_attributes.  
    oo_result = lo_sqs->createqueue(                                     " oo_result is returned for  
testing purpose "  
        iv_queuename = iv_queue_name  
        it_attributes = lt_attributes
```

```
).
MESSAGE 'SQS queue created' TYPE 'I'.
CATCH /aws1/cx_sqqueuedelrecently.
MESSAGE 'After deleting a queue, you should wait 60 seconds before creating
another queue with the same name.' TYPE 'E'.
CATCH /aws1/cx_sqsqqueuenameexists.
MESSAGE 'A queue with this name already exists.' TYPE 'E'.
ENDTRY.
```

- For API details, see [CreateQueue](#) in *AWS SDK for SAP ABAP API reference*.

## Delete a queue

The following code example shows how to delete an Amazon SQS queue.

### SDK for SAP ABAP

#### Note

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
TRY.
lo_sqs->deletequeue( iv_queueurl = iv_queue_url ).
MESSAGE 'SQS queue deleted' TYPE 'I'.
ENDTRY.
```

- For API details, see [DeleteQueue](#) in *AWS SDK for SAP ABAP API reference*.

## Get the URL of a queue

The following code example shows how to get the URL of an Amazon SQS queue.

### SDK for SAP ABAP

#### Note

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
TRY.
oo_result = lo_sqs->getqueueurl( iv_queuename = iv_queue_name ).           "
oo_result is returned for testing purpose "
MESSAGE 'Queue URL retrieved' TYPE 'I'.
CATCH /aws1/cx_sqqueuedoesnotexist.
MESSAGE 'The requested queue does not exist' TYPE 'E'.
ENDTRY.
```

- For API details, see [GetQueueUrl](#) in *AWS SDK for SAP ABAP API reference*.

## List queues

The following code example shows how to list Amazon SQS queues.

### SDK for SAP ABAP

#### Note

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
TRY.  
    oo_result = lo_sqs->listqueues( ).           " oo_result is returned for testing  
purpose "  
    MESSAGE 'Retrieved list of queue(s)' TYPE 'I'.  
ENDTRY.
```

- For API details, see [ListQueues](#) in *AWS SDK for SAP ABAP API reference*.

## Receive messages from a queue

The following code example shows how to receive messages from an Amazon SQS queue.

### SDK for SAP ABAP

#### Note

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Receive a message from an Amazon SQS queue.

```
TRY.  
    oo_result = lo_sqs->receivemessage( iv_queueurl = iv_queue_url ).      "  
oo_result is returned for testing purpose "  
    DATA(lt_messages) = oo_result->get_messages( ).  
    MESSAGE 'Message received from SQS queue' TYPE 'I'.  
    CATCH /aws1/cx_sqsoverlimit.  
        MESSAGE 'Maximum number of in flight messages reached' TYPE 'E'.  
    ENDTRY.
```

Receive a message from an Amazon SQS queue using long-poll support.

```
TRY.  
    oo_result = lo_sqs->receivemessage(                  " oo_result is returned for  
testing purpose "  
        iv_queueurl = iv_queue_url  
        iv_waittimeseconds = iv_wait_time      " time in seconds for long  
polling i.e. time for which the call waits for a message to arrive in queue before  
returning "  
    ).  
    DATA(lt_messages) = oo_result->get_messages( ).
```

```
MESSAGE 'Message received from SQS queue' TYPE 'I'.
CATCH /aws1/cx_sqsoverlimit.
MESSAGE 'Maximum number of in flight messages reached' TYPE 'E'.
ENDTRY.
```

- For API details, see [ReceiveMessage in AWS SDK for SAP ABAP API reference](#).

## Send a message to a queue

The following code example shows how to send a message to an Amazon SQS queue.

### SDK for SAP ABAP

#### Note

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
TRY.
    oo_result = lo_sqs->sendmessage(                                     " oo_result is returned for
testing purpose "
        iv_queueurl = iv_queue_url
        iv_messagebody = iv_message
    ).
    MESSAGE 'Message sent to SQS queue' TYPE 'I'.
CATCH /aws1/cx_sqsinvalidmsgconts.
    MESSAGE 'Message contains invalid characters' TYPE 'E'.
CATCH /aws1/cx_sqsunsupportedop.
    MESSAGE 'Operation not supported' TYPE 'E'.
ENDTRY.
```

- For API details, see [SendMessage in AWS SDK for SAP ABAP API reference](#).

## SageMaker examples using SDK for SAP ABAP

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for SAP ABAP with Amazon SageMaker.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

## Scenarios

### Get started with models and endpoints

The following code example shows how to:

- Start a training job.
- Create a SageMaker model.
- Create an endpoint configuration.
- Create an endpoint.
- Delete an endpoint.
- Delete an endpoint configuration.
- Delete a model.

## Amazon Textract examples using SDK for SAP ABAP

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for SAP ABAP with Amazon Textract.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4544\)](#)
- [Scenarios \(p. 4550\)](#)

## Actions

### Analyze a document

The following code example shows how to analyze a document using Amazon Textract.

## SDK for SAP ABAP

### Note

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

### Note

## Actions

### Create an identity pool

The following code example shows how to find the Amazon Cognito Identity with the given name, creating it if it's not found.

#### SDK for Swift

##### Note

This is prerelease documentation for an SDK in preview release. It is subject to change.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a new identity pool.

```
func createIdentityPool(name: String) async throws -> String? {
    let cognitoInputCall = CreateIdentityPoolInput(developerProviderName:
"com.exampleco.CognitoIdentityDemo",
                                                identityPoolName: name)

    do {
        let result = try await cognitoIdentityClient.createIdentityPool(input:
cognitoInputCall)
        guard let poolId = result.identityPoolId else {
            return nil
        }

        return poolId
    } catch {
        print("ERROR: ", dump(error, name: "Error attempting to create the identity
pool"))
    }

    return nil
}
```

- For more information, see [AWS SDK for Swift developer guide](#).
- For API details, see the following topics in *AWS SDK for Swift API reference*.
  - [createIdentityPool](#)
  - [listIdentityPools](#)

## List identity pools

The following code example shows how to get a list of Amazon Cognito Identity pools.

### SDK for Swift

#### Note

This is prerelease documentation for an SDK in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Find the ID of an identity pool given its name.

```
func getIdentityPoolID(name: String) async throws -> String? {
    var token: String? = nil

    // Iterate over the identity pools until a match is found.
    repeat {
        /// `token` is a value returned by `ListIdentityPools()` if the returned
        list
        /// of identity pools is only a partial list. You use the `token` to tell
        Cognito that
        /// you want to continue where you left off previously; specifying `nil` or
        not providing
        /// it means "start at the beginning."

        let listPoolsInput = ListIdentityPoolsInput(maxResults: 25, nextToken:
        token)

        /// Read pages of identity pools from Cognito until one is found
        /// whose name matches the one specified in the `name` parameter.
        /// Return the matching pool's ID. Each time we ask for the next
        /// page of identity pools, we pass in the token given by the
        /// previous page.

        do {
            let output = try await cognitoIdentityClient.listIdentityPools(input:
            listPoolsInput)

            if let identityPools = output.identityPools {
                for pool in identityPools {
                    if pool.identityPoolName == name {
                        return pool.identityPoolId!
                    }
                }
            }

            token = output.nextToken
        } catch {
            print("ERROR: ", dump(error, name: "Trying to get list of identity
            pools"))
        }
    } while token != nil

    return nil
}
```

Get the ID of an existing identity pool or create it if it doesn't already exist.

```
public func getOrCreateIdentityPoolID(name: String) async throws -> String? {
    // See if the pool already exists

    do {
        guard let poolId = try await self.getIdentityPoolID(name: name) else {
            let poolId = try await self.createIdentityPool(name: name)
            return poolId
        }

        return poolId
    } catch {
        print("ERROR: ", dump(error, name: "Trying to get the identity pool ID"))
        return nil
    }
}
```

## Actions

### Attach a policy to a role

The following code example shows how to attach an IAM policy to a role.

#### SDK for Swift

##### Note

This is prerelease documentation for an SDK in preview release. It is subject to change.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public func attachRolePolicy(role: String, policyArn: String) async throws {
    let input = AttachRolePolicyInput(
```

```
        policyArn: policyArn,
        roleName: role
    )
do {
    _ = try await client.attachRolePolicy(input: input)
} catch {
    throw error
}
}
```

- For API details, see [AttachRolePolicy](#) in *AWS SDK for Swift API reference*.

## Create a role

The following code example shows how to create an IAM role.

### SDK for Swift

#### Note

This is prerelease documentation for an SDK in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public func createRole(name: String, policyDocument: String) async throws -> String
{
    let input = CreateRoleInput(
        assumeRolePolicyDocument: policyDocument,
        roleName: name
    )
    do {
        let output = try await client.createRole(input: input)
        guard let role = output.role else {
            throw ServiceHandlerError.noSuchRole
        }
        guard let id = role.roleId else {
            throw ServiceHandlerError.noSuchRole
        }
        return id
    } catch {
        throw error
    }
}
```

- For API details, see [CreateRole](#) in *AWS SDK for Swift API reference*.

## Create a service-linked role

The following code example shows how to create an IAM service-linked role.

### SDK for Swift

#### Note

This is prerelease documentation for an SDK in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public func createServiceLinkedRole(service: String, suffix: String? = nil,  
description: String?)  
    async throws -> IamClientTypes.Role {  
    let input = CreateServiceLinkedRoleInput(  
        aWSServiceName: service,  
        customSuffix: suffix,  
        description: description  
    )  
    do {  
        let output = try await client.createServiceLinkedRole(input: input)  
        guard let role = output.role else {  
            throw ServiceHandlerError.noSuchRole  
        }  
        return role  
    } catch {  
        throw error  
    }  
}
```

- For API details, see [CreateServiceLinkedRole](#) in *AWS SDK for Swift API reference*.

## Create a user

The following code example shows how to create an IAM user.

### SDK for Swift

#### Note

This is prerelease documentation for an SDK in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public func createUser(name: String) async throws -> String {  
    let input = CreateUserInput(  
        userName: name  
    )  
    do {  
        let output = try await client.createUser(input: input)  
        guard let user = output.user else {  
            throw ServiceHandlerError.noSuchUser  
        }  
        guard let id = user.userId else {  
            throw ServiceHandlerError.noSuchUser  
        }  
        return id  
    } catch {  
        throw error  
    }  
}
```

- For API details, see [CreateUser](#) in *AWS SDK for Swift API reference*.

## Get a policy

The following code example shows how to get an IAM policy.

## SDK for Swift

### Note

This is prerelease documentation for an SDK in preview release. It is subject to change.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public func getPolicy(arn: String) async throws -> IamClientTypes.Policy {
    let input = GetPolicyInput(
        policyArn: arn
    )
    do {
        let output = try await client.getPolicy(input: input)
        guard let policy = output.policy else {
            throw ServiceHandlerError.noSuchPolicy
        }
        return policy
    } catch {
        throw error
    }
}
```

- For API details, see [GetPolicy](#) in *AWS SDK for Swift API reference*.

## Get a role

The following code example shows how to get an IAM role.

## SDK for Swift

### Note

This is prerelease documentation for an SDK in preview release. It is subject to change.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public func getRole(name: String) async throws -> IamClientTypes.Role {
    let input = GetRoleInput(
        roleName: name
    )
    do {
        let output = try await client.getRole(input: input)
        guard let role = output.role else {
            throw ServiceHandlerError.noSuchRole
        }
        return role
    } catch {
        throw error
    }
}
```

- For API details, see [GetRole](#) in *AWS SDK for Swift API reference*.

## List groups

The following code example shows how to list IAM groups.

## SDK for Swift

### Note

This is prerelease documentation for an SDK in preview release. It is subject to change.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public func listGroups() async throws -> [String] {
    var groupList: [String] = []
    var marker: String? = nil
    var isTruncated: Bool

    repeat {
        let input = ListGroupsInput(marker: marker)
        let output = try await client.listGroups(input: input)

        guard let groups = output.groups else {
            return groupList
        }

        for group in groups {
            if let name = group.groupName {
                groupList.append(name)
            }
        }
        marker = output.marker
        isTruncated = output.isTruncated
    } while isTruncated == true
    return groupList
}
```

- For API details, see [ListGroups](#) in *AWS SDK for Swift API reference*.

## List inline policies for a role

The following code example shows how to list inline policies for an IAM role.

## SDK for Swift

### Note

This is prerelease documentation for an SDK in preview release. It is subject to change.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public func listRolePolicies(role: String) async throws -> [String] {
    var policyList: [String] = []
    var marker: String? = nil
    var isTruncated: Bool

    repeat {
        let input = ListRolePoliciesInput(
            marker: marker,
            roleName: role
        )
        let output = try await client.listRolePolicies(input: input)

        guard let policies = output.policyNames else {
```

```
        return policyList
    }

    for policy in policies {
        policyList.append(policy)
    }
    marker = output.marker
    isTruncated = output.isTruncated
} while isTruncated == true
return policyList
}
```

- For API details, see [ListRolePolicies](#) in *AWS SDK for Swift API reference*.

## List policies

The following code example shows how to list IAM policies.

### SDK for Swift

#### Note

This is prerelease documentation for an SDK in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public func listPolicies() async throws -> [MyPolicyRecord] {
    var policyList: [MyPolicyRecord] = []
    var marker: String? = nil
    var isTruncated: Bool

    repeat {
        let input = ListPoliciesInput(marker: marker)
        let output = try await client.listPolicies(input: input)

        guard let policies = output.policies else {
            return policyList
        }

        for policy in policies {
            guard let name = policy.policyName,
                  let id = policy.policyId,
                  let arn = policy.arn else {
                throw ServiceHandlerError.noSuchPolicy
            }
            policyList.append(MyPolicyRecord(name: name, id: id, arn: arn))
        }
        marker = output.marker
        isTruncated = output.isTruncated
    } while isTruncated == true
    return policyList
}
```

- For API details, see [ListPolicies](#) in *AWS SDK for Swift API reference*.

## List policies attached to a role

The following code example shows how to list policies attached to an IAM role.

## SDK for Swift

### Note

This is prerelease documentation for an SDK in preview release. It is subject to change.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// Returns a list of AWS Identity and Access Management (IAM) policies
/// that are attached to the role.
///
/// - Parameter role: The IAM role to return the policy list for.
///
/// - Returns: An array of `IamClientTypes.AttachedPolicy` objects
/// describing each managed policy that's attached to the role.
public func listAttachedRolePolicies(role: String) async throws ->
[IamClientTypes.AttachedPolicy] {
    var policyList: [IamClientTypes.AttachedPolicy] = []
    var marker: String? = nil
    var isTruncated: Bool

    repeat {
        let input = ListAttachedRolePoliciesInput(
            marker: marker,
            roleName: role
        )
        let output = try await client.listAttachedRolePolicies(input: input)

        guard let attachedPolicies = output.attachedPolicies else {
            return policyList
        }

        for attachedPolicy in attachedPolicies {
            policyList.append(attachedPolicy)
        }
        marker = output.marker
        isTruncated = output.isTruncated
    } while isTruncated == true
    return policyList
}
```

- For API details, see [ListAttachedRolePolicies](#) in *AWS SDK for Swift API reference*.

## List roles

The following code example shows how to list IAM roles.

## SDK for Swift

### Note

This is prerelease documentation for an SDK in preview release. It is subject to change.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public func listRoles() async throws -> [String] {
    var roleList: [String] = []
```

```
var marker: String? = nil
var isTruncated: Bool

repeat {
    let input = ListRolesInput(marker: marker)
    let output = try await client.listRoles(input: input)

    guard let roles = output.roles else {
        return roleList
    }

    for role in roles {
        if let name = role.roleName {
            roleList.append(name)
        }
    }
    marker = output.marker
    isTruncated = output.isTruncated
} while isTruncated == true
return roleList
}
```

- For API details, see [ListRoles](#) in [AWS SDK for Swift API reference](#).

## List users

The following code example shows how to list IAM users.

### SDK for Swift

#### Note

This is prerelease documentation for an SDK in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public func listUsers() async throws -> [MyUserRecord] {
    var userList: [MyUserRecord] = []
    var marker: String? = nil
    var isTruncated: Bool

    repeat {
        let input = ListUsersInput(marker: marker)
        let output = try await client.listUsers(input: input)

        guard let users = output.users else {
            return userList
        }

        for user in users {
            if let id = user.userId, let name = user.userName {
                userList.append(MyUserRecord(id: id, name: name))
            }
        }
        marker = output.marker
        isTruncated = output.isTruncated
    } while isTruncated == true
    return userList
}
```

- For API details, see [ListUsers](#) in *AWS SDK for Swift API reference*.

## Amazon S3 examples using SDK for Swift

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Swift with Amazon Simple Storage Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 4568\)](#)
- [Scenarios \(p. 4572\)](#)

## Actions

### [Copy an object from one bucket to another](#)

The following code example shows how to copy an S3 object from one bucket to another.

#### SDK for Swift

##### Note

This is prerelease documentation for an SDK in preview release. It is subject to change.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public func copyFile(from sourceBucket: String, name: String, to destBucket: String) async throws {
    let srcUrl = ("\"sourceBucket)/
    \name").addingPercentEncoding(withAllowedCharacters: .urlPathAllowed)

    let input = CopyObjectInput(
        bucket: destBucket,
        copySource: srcUrl,
        key: name
    )
    _ = try await client.copyObject(input: input)
}
```

- For API details, see [CopyObject](#) in *AWS SDK for Swift API reference*.

## [Create a bucket](#)

The following code example shows how to create an S3 bucket.

#### SDK for Swift

##### Note

This is prerelease documentation for an SDK in preview release. It is subject to change.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public func createBucket(name: String) async throws {
    let config = S3ClientTypes.CreateBucketConfiguration(
        locationConstraint: .usEast2
    )
    let input = CreateBucketInput(
        bucket: name,
        createBucketConfiguration: config
    )
    _ = try await client.createBucket(input: input)
}
```

- For API details, see [CreateBucket](#) in *AWS SDK for Swift API reference*.

## Delete an empty bucket

The following code example shows how to delete an empty S3 bucket.

### SDK for Swift

#### Note

This is prerelease documentation for an SDK in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public func deleteBucket(name: String) async throws {
    let input = DeleteBucketInput(
        bucket: name
    )
    _ = try await client.deleteBucket(input: input)
}
```

- For API details, see [DeleteBucket](#) in *AWS SDK for Swift API reference*.

## Delete an object

The following code example shows how to delete an S3 object.

### SDK for Swift

#### Note

This is prerelease documentation for an SDK in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public func deleteFile(bucket: String, key: String) async throws {
    let input = DeleteObjectInput(
        bucket: bucket,
        key: key
    )

    do {
        _ = try await client.deleteObject(input: input)
    }
}
```

```
        } catch {
            throw error
        }
    }
```

- For API details, see [DeleteObject](#) in *AWS SDK for Swift API reference*.

## Delete multiple objects

The following code example shows how to delete multiple objects from an S3 bucket.

### SDK for Swift

#### Note

This is prerelease documentation for an SDK in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public func deleteObjects(bucket: String, keys: [String]) async throws {
    let input = DeleteObjectsInput(
        bucket: bucket,
        delete: S3ClientTypes.Delete(
            objects: keys.map({ S3ClientTypes.ObjectIdentifier(key: $0) }),
            quiet: true
        )
    )

    do {
        _ = try await client.deleteObjects(input: input)
    } catch {
        throw error
    }
}
```

- For API details, see [DeleteObjects](#) in *AWS SDK for Swift API reference*.

## Get an object from a bucket

The following code example shows how to read data from an object in an S3 bucket.

### SDK for Swift

#### Note

This is prerelease documentation for an SDK in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Download an object from a bucket to a local file.

```
public func downloadFile(bucket: String, key: String, to: String) async throws {
    let fileUrl = URL(fileURLWithPath: to).appendingPathComponent(key)

    let input = GetObjectInput(
        bucket: bucket,
```

```
        key: key
    )
    let output = try await client.getObject(input: input)

    // Get the data stream object. Return immediately if there isn't one.
    guard let body = output.body else {
        return
    }
    let data = body.toBytes().toData()
    try data.write(to: fileUrl)
}
```

Read an object into a Swift Data object.

```
public func readFile(bucket: String, key: String) async throws -> Data {
    let input = GetObjectInput(
        bucket: bucket,
        key: key
    )
    let output = try await client.getObject(input: input)

    // Get the stream and return its contents in a `Data` object. If
    // there is no stream, return an empty `Data` object instead.
    guard let body = output.body else {
        return "".data(using: .utf8)!
    }
    let data = body.toBytes().toData()
    return data
}
```

- For API details, see [GetObject](#) in *AWS SDK for Swift API reference*.

## List objects in a bucket

The following code example shows how to list objects in an S3 bucket.

### SDK for Swift

#### Note

This is prerelease documentation for an SDK in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public func listBucketFiles(bucket: String) async throws -> [String] {
    let input = ListObjectsV2Input(
        bucket: bucket
    )
    let output = try await client.listObjectsV2(input: input)
    var names: [String] = []

    guard let objList = output.contents else {
        return []
    }

    for obj in objList {
        if let objName = obj.key {
            names.append(objName)
        }
    }
}
```

```
        }
    }

    return names
}
```

- For API details, see [ListObjects](#) in *AWS SDK for Swift API reference*.

## Upload an object to a bucket

The following code example shows how to upload an object to an S3 bucket.

### SDK for Swift

#### Note

This is prerelease documentation for an SDK in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Upload a file from local storage to a bucket.

```
public func uploadFile(bucket: String, key: String, file: String) async throws {
    let urlString = URL(fileURLWithPath: file)
    let fileData = try Data(contentsOf: urlString)
    let dataStream = ByteStream.from(data: fileData)

    let input = PutObjectInput(
        body: dataStream,
        bucket: bucket,
        key: key
    )
    _ = try await client.putObject(input: input)
}
```

Upload the contents of a Swift Data object to a bucket.

```
public func createFile(bucket: String, key: String, withData data: Data) async
throws {
    let dataStream = ByteStream.from(data: data)

    let input = PutObjectInput(
        body: dataStream,
        bucket: bucket,
        key: key
    )
    _ = try await client.putObject(input: input)
}
```

- For API details, see [PutObject](#) in *AWS SDK for Swift API reference*.

## Scenarios

### Get started with buckets and objects

The following code example shows how to:

- Create a bucket.
- Upload a file to the bucket.
- Download an object from a bucket.
- Copy an object to a subfolder in a bucket.
- List the objects in a bucket.
- Delete the objects in a bucket.
- Delete a bucket.

## SDK for Swift

### Note

This is prerelease documentation for an SDK in preview release. It is subject to change.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

A Swift class that handles calls to the SDK for Swift.

```
import Foundation
import AWSS3
import ClientRuntime
import AWSClientRuntime

/// A class containing all the code that interacts with the AWS SDK for Swift.
public class ServiceHandler {
    let client: S3Client

    /// Initialize and return a new ``ServiceHandler`` object, which is used to drive
    /// the AWS calls
    /// used for the example.
    ///
    /// - Returns: A new ``ServiceHandler`` object, ready to be called to
    /// execute AWS operations.
    public init() async {
        do {
            client = try await S3Client()
        } catch {
            print("ERROR: ", dump(error, name: "Initializing s3 client"))
            exit(1)
        }
    }

    /// Create a new user given the specified name.
    ///
    /// - Parameters:
    ///   - name: Name of the bucket to create.
    /// - Throws an exception if an error occurs.
    public func createBucket(name: String) async throws {
        let config = S3ClientTypes.CreateBucketConfiguration(
            locationConstraint: .usEast2
        )
        let input = CreateBucketInput(
            bucket: name,
            createBucketConfiguration: config
        )
        _ = try await client.createBucket(input: input)
    }

    /// Delete a bucket.
    /// - Parameter name: Name of the bucket to delete.
}
```

```
public func deleteBucket(name: String) async throws {
    let input = DeleteBucketInput(
        bucket: name
    )
    _ = try await client.deleteBucket(input: input)
}

/// Upload a file from local storage to the bucket.
/// - Parameters:
///   - bucket: Name of the bucket to upload the file to.
///   - key: Name of the file to create.
///   - file: Path name of the file to upload.
public func uploadFile(bucket: String, key: String, file: String) async throws {
    let urlString = URL(fileURLWithPath: file)
    let fileData = try Data(contentsOf: urlString)
