/*
This is a basic scenario for using AWS Identity and Access Management (IAM) and AWS
Security Token Service (STS).

This example will do the following:

    * Create a user that has no permissions.
    * Create a role and policy that grant s3>ListAllMyBuckets permission.
    * Grant the user permission to assume the role.
    * Create an S3 client object as the user and try to list buckets (this should
fail).
    * Get temporary credentials by assuming the role.
    * Create an S3 client object with the temporary credentials and list the buckets
(this should succeed).
    * Delete all the resources.

## Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create functions that wrap IAM user actions.

```
/*
To run this Java V2 code example, set up your development environment, including
your credentials.

For information, see this documentation topic:

https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html

This example performs these operations:

1. Creates a user that has no permissions.
2. Creates a role and policy that grants Amazon S3 permissions.
3. Creates a role.
4. Grants the user permissions.
```

```
    5. Gets temporary credentials by assuming the role. Creates an Amazon S3 Service
client object with the temporary credentials.
    6. Deletes the resources.
*/

## JavaScript

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
export const REGION = "REGION"; // For example, "us-east-1".
// Create an Amazon S3 service client object.
export const iamClient = new IAMClient({ region: REGION });
```

Create an IAM user and a role that grants permission to list Amazon S3 buckets. The user has rights only to assume the role. After assuming the role, use temporary credentials to list buckets for the account.

```
// Import required AWS SDK clients and commands for Node.js.
import { iamClient, REGION } from "../libs/iamClient.js"; // Helper function that
  creates an IAM service client module.
import {
  CreateUserCommand,
  CreateAccessKeyCommand,
  CreatePolicyCommand,
  CreateRoleCommand,
  AttachRolePolicyCommand,
  AttachUserPolicyCommand,
  DeleteAccessKeyCommand,
  DeleteUserCommand,
  DeleteRoleCommand,
  DeletePolicyCommand,
  DetachUserPolicyCommand,
  DetachRolePolicyCommand,
```

```
    } from "@aws-sdk/client-iam";
    import { ListBucketsCommand, S3Client } from "@aws-sdk/client-s3";
    import { AssumeRoleCommand, STSClient } from "@aws-sdk/client-sts";

    if (process.argv.length < 6) {
        console.log(

Kotlin

## SDK for Kotlin

### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create functions that wrap IAM user actions.

```
suspend fun main(args: Array<String>) {  
  
    val usage = """  
Usage:  
    <username> <policyName> <roleName> <roleSessionName> <fileLocation>  
<bucketName>  
  
    Where:  
        username - The name of the IAM user to create.  
        policyName - The name of the policy to create.  
        roleName - The name of the role to create.  
        roleSessionName - The name of the session required for the assumeRole  
operation.  
        fileLocation - The file location to the JSON required to create the role  
(see Readme).  
        bucketName - The name of the Amazon S3 bucket from which objects are read.  
    """

## Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create an IAM user and a role that grants permission to list Amazon S3 buckets. The user has rights only to assume the role. After assuming the role, use temporary credentials to list buckets for the account.

```
import json
import sys
import time
from uuid import uuid4

import boto3
from botocore.exceptions import ClientError

def progress_bar(seconds):
    """Shows a simple progress bar in the command window."""
    for _ in range(seconds):
        time.sleep(1)
        print('.', end='')
        sys.stdout.flush()
    print()

def setup(iam_resource):
    """
    Creates a new user with no permissions.
    Creates an access key pair for the user.
    Creates a role with a policy that lets the user assume the role.
    Creates a policy that allows listing Amazon S3 buckets.
    Attaches the policy to the role.
    Creates an inline policy for the user that lets the user assume the role.

    :param iam_resource: A Boto3 AWS Identity and Access Management (IAM) resource
                         that has permissions to create users, roles, and policies
                         in the account.
    :return: The newly created user, user key, and role.
    """
    # Create a new IAM user
    user = iam_resource.create_user(UserName='test-user')

## Create read-only and read-write IAM users using an AWS SDK

The following code example shows how to:

- Create two IAM users.
- Attach a policy that lets one of the users get and put objects in an Amazon Simple Storage Service (Amazon S3) bucket.
- Attach a policy that lets the other user get objects from the bucket.
- Obtain differing permissions to the bucket based on user credentials.

Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create functions that wrap IAM user actions.

## Cross-service examples for IAM using AWS SDKs

The following code examples show how to use AWS Identity and Access Management with AWS SDKs. Each example contains a sample application that works across multiple AWS services.

### Examples

- [Create a long-lived Amazon EMR cluster and run several steps using an AWS SDK \(p. 1098\)](#)
- [Create a short-lived Amazon EMR cluster and run a step using an AWS SDK \(p. 1099\)](#)

## Create a long-lived Amazon EMR cluster and run several steps using an AWS SDK

The following code example shows how to create a long-lived Amazon EMR cluster and run several steps.

### Python

#### SDK for Python (Boto3)

Create a long-lived Amazon EMR cluster that uses Apache Spark to query historical Amazon review data from the [Amazon Customer Reviews Dataset](#). Run a job that gets data for top-rated products in specific categories that contain keywords in their product titles. Job results are written to an Amazon Simple Storage Service (Amazon S3) bucket.

- Create an Amazon S3 bucket and upload a job script.
- Create AWS Identity and Access Management (IAM) roles.
- Create Amazon Elastic Compute Cloud (Amazon EC2) security groups.
- Create a long-lived cluster and run several job steps.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon EC2
- Amazon EMR
- IAM
- Amazon S3

## Create a short-lived Amazon EMR cluster and run a step using an AWS SDK

The following code example shows how to create a short-lived Amazon EMR cluster that runs a step and automatically terminates after the step completes.

Python

### SDK for Python (Boto3)

Create a short-lived Amazon EMR cluster that estimates the value of pi using Apache Spark to parallelize a large number of calculations. The job writes output to Amazon EMR logs and to an Amazon Simple Storage Service (Amazon S3) bucket. The cluster terminates itself after completing the job.

- Create an Amazon S3 bucket and upload a job script.
- Create AWS Identity and Access Management (IAM) roles.
- Create Amazon Elastic Compute Cloud (Amazon EC2) security groups.
- Create a short-lived cluster and run a single job step.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon EC2
- Amazon EMR
- IAM
- Amazon S3

## Code examples for AWS IoT using AWS SDKs

The following code examples show how to use AWS IoT with an AWS software development kit (SDK).

### Code examples

- [Actions for AWS IoT using AWS SDKs \(p. 1099\)](#)
  - [Get information about an endpoint using an AWS SDK \(p. 1099\)](#)
  - [List your AWS IoT things using an AWS SDK \(p. 1100\)](#)

## Actions for AWS IoT using AWS SDKs

The following code examples show how to use AWS IoT with AWS SDKs. Each example calls an individual service function.

### Examples

- [Get information about an endpoint using an AWS SDK \(p. 1099\)](#)
- [List your AWS IoT things using an AWS SDK \(p. 1100\)](#)

## Get information about an endpoint using an AWS SDK

The following code example shows how to get AWS IoT endpoint information.

Rust

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

## Create a grant for an AWS KMS key using an AWS SDK

The following code examples show how to create a grant for a KMS key.

### .NET

#### AWS SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

This examples grants a user permission to use a key for encryption and decryption.

```
public static async Task Main()
{
    var client = new AmazonKeyManagementServiceClient();

    // The identity that is given permission to perform the operations
```

```
// specified in the grant.
var grantee = "arn:aws:iam::111122223333:role/ExampleRole";

// The identifier of the AWS KMS key to which the grant applies. You
// can use the key ID or the Amazon Resource Name (ARN) of the KMS key.
var keyId = "7c9ecc2-38cb-4c4f-9db3-766ee8dd3ad4";

var request = new CreateGrantRequest
{
    GranteePrincipal = grantee,
    KeyId = keyId,

    // A list of operations that the grant allows.
    Operations = new List<string>
    {
        "Encrypt",
        "Decrypt",
    },
};

var response = await client.CreateGrantAsync(request);

string grantId = response.GrantId; // The unique identifier of the
grant.
string grantToken = response.GrantToken; // The grant token.

Console.WriteLine($"Id: {grantId}, Token: {grantToken}");
}
```

- For API details, see [CreateGrant in AWS SDK for .NET API Reference](#).

## Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String createGrant(KmsClient kmsClient, String keyId, String
granteePrincipal, String operation) {

    try {
        CreateGrantRequest grantRequest = CreateGrantRequest.builder()
            .keyId(keyId)
            .granteePrincipal(granteePrincipal)
            .operationsWithStrings(operation)
            .build();

        CreateGrantResponse response = kmsClient.createGrant(grantRequest);
        return response.grantId();

    }catch (KmsException e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
    return "";
}
```

## Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

This example grants permission to let a user generate a data key that can be used for encryption.

```
class GrantManager:  
    def __init__(self, kms_client):  
        self.kms_client = kms_client  
  
    def create_grant(self, key_id):  
        """  
        Creates a grant for a key that lets a user generate a symmetric data  
        encryption key.  
  
        :param key_id: The ARN or ID of the key.  
        :return: The grant that is created.  
        """  
        user = input(  
            f"Enter the ARN of an IAM user to grant that user GenerateDataKey "
```

```
f"permissions on key {key_id}.")
if user != '':
    try:
        grant = self.kms_client.create_grant(
            KeyId=key_id, GranteePrincipal=user,
            Operations=['GenerateDataKey'])
    except ClientError as err:
        logger.error(
            "Couldn't create a grant on key %s. Here's why: %s",
            key_id, err.response['Error']['Message'])
    else:
        print(f"Grant created on key {key_id}.")
        return grant
else:
    print("Skipping grant creation.")
```

- For API details, see [CreateGrant in AWS SDK for Python \(Boto3\) API Reference](#).

## Create an AWS KMS key using an AWS SDK

The following code examples show how to create an AWS KMS key.

.NET

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.Threading.Tasks;
using Amazon.KeyManagementService;
using Amazon.KeyManagementService.Model;

public class CreateKey
{
    public static async Task Main()
    {
        // Note that if you need to create a Key in an AWS Region
        // other than the Region defined for the default user, you need to
        // pass the Region to the client constructor.
        var client = new AmazonKeyManagementServiceClient();

        // The call to CreateKeyAsync will create a symmetrical AWS KMS
        // key. For more information about symmetrical and asymmetrical
        // keys, see:
        //
        // https://docs.aws.amazon.com/kms/latest/developerguide/symm-asymm-
choose.html
        var response = await client.CreateKeyAsync(new CreateKeyRequest());

        // The KeyMetadata object contains information about the new AWS KMS
        // key.
        KeyMetadata keyMetadata = response.KeyMetadata;

        if (keyMetadata is not null)
        {
            Console.WriteLine($"KMS Key: {keyMetadata.KeyId} was successfully
created.");
        }
    }
}
```

```
        else

## Decrypt ciphertext with an AWS KMS key using an AWS SDK

The following code examples show how to decrypt ciphertext that was encrypted by a KMS key.

Go

### SDK for Go V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
package main

import (
    "context"
    b64 "encoding/base64"
    "flag"
    "fmt"

    "github.com/aws/aws-sdk-go-v2/config"
    "github.com/aws/aws-sdk-go-v2/service/kms"
)

// KMSDecryptAPI defines the interface for the Decrypt function.
// We use this interface to test the function using a mocked service.
type KMSDecryptAPI interface {
    Decrypt(ctx context.Context,
        params *kms.DecryptInput,
        optFns ...func(*kms.Options)) (*kms.DecryptOutput, error)
}

// DecodeData decrypts some text that was encrypted with an AWS Key Management
// Service (AWS KMS) key (KMS key).
// Inputs:
```

```
//      c is the context of the method call, which includes the AWS Region.
//      api is the interface that defines the method call.
//      input defines the input arguments to the service call.
// Output:
//      If success, a DecryptOutput object containing the result of the service call
//      and nil.
//      Otherwise, nil and an error from the call to Decrypt.
func DecodeData(c context.Context, api KMSDecryptAPI, input *kms.DecryptInput)
(*kms.DecryptOutput, error) {
    return api.Decrypt(c, input)
}

func main() {
    data := flag.String("d", "", "The encrypted data, as a string")
    flag.Parse()

## Encrypt text using an AWS KMS key using an AWS SDK

The following code examples show how to encrypt text using a KMS key.

Go

### SDK for Go V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
package main

import (
    "context"
    b64 "encoding/base64"
    "flag"
    "fmt"

    "github.com/aws/aws-sdk-go-v2/config"
    "github.com/aws/aws-sdk-go-v2/service/kms"
)

// KMSEncryptAPI defines the interface for the Encrypt function.
// We use this interface to test the function using a mocked service.
type KMSEncryptAPI interface {
    Encrypt(ctx context.Context,
        params *kms.EncryptInput,
        optFns ...func(*kms.Options)) (*kms.EncryptOutput, error)
}

// EncryptText encrypts some text using an AWS Key Management Service (AWS KMS) key
// (KMS key).
// Inputs:
//     c is the context of the method call, which includes the AWS Region.
//     api is the interface that defines the method call.
//     input defines the input arguments to the service call.
// Output:
//     If success, an EncryptOutput object containing the result of the service
//     call and nil.
//     Otherwise, nil and an error from the call to Encrypt.
func EncryptText(c context.Context, api KMSEncryptAPI, input *kms.EncryptInput)
    (*kms.EncryptOutput, error) {
    return api.Encrypt(c, input)
}
```

```
func main() {
    keyID := flag.String("k", "", "The ID of a KMS key")
    text := flag.String("t", "", "The text to encrypt")
    flag.Parse()

    if *keyID == "" || *text == "" {
        fmt.Println("You must supply the ID of a KMS key and some text")
        fmt.Println("-k KEY-ID -t \"text\"")
        return
    }

    cfg, err := config.LoadDefaultConfig(context.TODO())
    if err != nil {
        panic("configuration error, " + err.Error())
    }

    client := kms.NewFromConfig(cfg)

    input := &kms.EncryptInput{
        KeyId:     keyID,
        Plaintext: []byte(*text),
    }

    result, err := EncryptText(context.TODO(), client, input)
    if err != nil {
        fmt.Println("Got error encrypting data:")
        fmt.Println(err)
        return
    }

    blobString := b64.StdEncoding.EncodeToString(result.CiphertextBlob)

    fmt.Println(blobString)
}
```

## Scenarios for AWS KMS using AWS SDKs

The following code examples show how to use AWS Key Management Service with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Encrypt and decrypt text with AWS KMS keys using an AWS SDK \(p. 1146\)](#)
- [Manage AWS KMS keys using an AWS SDK \(p. 1148\)](#)

## Encrypt and decrypt text with AWS KMS keys using an AWS SDK

The following code example shows how to:

- Encrypt plain text by using a KMS key.
- Decrypt ciphertext by using a KMS key.
- Reencrypt ciphertext by using a second KMS key.

### Python

#### SDK for Python (Boto3)

## Scenarios for Amazon Keyspaces using AWS SDKs

The following code examples show how to use Amazon Keyspaces (for Apache Cassandra) with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Get started with Amazon Keyspaces keyspaces and tables using an AWS SDK \(p. 1161\)](#)

## Get started with Amazon Keyspaces keyspaces and tables using an AWS SDK

The following code example shows how to:

- Create a keyspace.
- Create a table in the keyspace. The table is configured with a schema to hold movie data and has point-in-time recovery enabled.
- Connect to the keyspace with a connection secured by TLS and authenticated with Signature V4 (SigV4).
- Query the table by adding, retrieving, and updating movie data.
- Update the table by adding a column to track watched movies.
- Restore the table to a previous point in time.
- Delete the table and keyspace.

## Python

## Code examples for Kinesis using AWS SDKs

The following code examples show how to use Amazon Kinesis with an AWS software development kit (SDK).

### Code examples

- [Actions for Kinesis using AWS SDKs \(p. 1171\)](#)
  - [Add tags to a Kinesis stream using an AWS SDK \(p. 1172\)](#)
  - [Create a Kinesis stream using an AWS SDK \(p. 1173\)](#)
  - [Delete a Kinesis stream using an AWS SDK \(p. 1176\)](#)
  - [Deregister a consumer from a Kinesis stream using an AWS SDK \(p. 1179\)](#)
  - [Describe a Kinesis stream using an AWS SDK \(p. 1180\)](#)
  - [Get data in batches from a Kinesis stream using an AWS SDK \(p. 1182\)](#)
  - [List Kinesis streams using an AWS SDK \(p. 1185\)](#)
  - [List the tags associated with a Kinesis stream using an AWS SDK \(p. 1187\)](#)
  - [List the consumers of a Kinesis stream using an AWS SDK \(p. 1188\)](#)
  - [Put data into a Kinesis stream using an AWS SDK \(p. 1189\)](#)
  - [Register a consumer to a Kinesis stream using an AWS SDK \(p. 1193\)](#)
- [Scenarios for Kinesis using AWS SDKs \(p. 1194\)](#)
  - [Get started with basic Kinesis data stream operations using an AWS SDK \(p. 1194\)](#)

## Actions for Kinesis using AWS SDKs

The following code examples show how to use Amazon Kinesis with AWS SDKs. Each example calls an individual service function.

### Examples

- [Add tags to a Kinesis stream using an AWS SDK \(p. 1172\)](#)
- [Create a Kinesis stream using an AWS SDK \(p. 1173\)](#)
- [Delete a Kinesis stream using an AWS SDK \(p. 1176\)](#)
- [Deregister a consumer from a Kinesis stream using an AWS SDK \(p. 1179\)](#)
- [Describe a Kinesis stream using an AWS SDK \(p. 1180\)](#)
- [Get data in batches from a Kinesis stream using an AWS SDK \(p. 1182\)](#)
- [List Kinesis streams using an AWS SDK \(p. 1185\)](#)
- [List the tags associated with a Kinesis stream using an AWS SDK \(p. 1187\)](#)
- [List the consumers of a Kinesis stream using an AWS SDK \(p. 1188\)](#)
- [Put data into a Kinesis stream using an AWS SDK \(p. 1189\)](#)

- Register a consumer to a Kinesis stream using an AWS SDK (p. 1193)

## Add tags to a Kinesis stream using an AWS SDK

The following code example shows how to add tags to a Kinesis stream.

.NET

### AWS SDK for .NET

#### Note

## Data generator for Kinesis Data Analytics using AWS SDKs

The following code examples show how to use Amazon Kinesis Data Analytics with AWS SDKs.

### Examples

- [Generate a Kinesis stream with a referrer using an AWS SDK \(p. 1207\)](#)

- Generate a Kinesis stream with blood pressure anomalies using an AWS SDK (p. 1207)
- Generate a Kinesis stream with data in columns using an AWS SDK (p. 1209)
- Generate a Kinesis stream with heart rate anomalies using an AWS SDK (p. 1209)
- Generate a Kinesis stream with hotspots using an AWS SDK (p. 1210)
- Generate a Kinesis stream with log entries using an AWS SDK (p. 1211)
- Generate a Kinesis stream with stagger data using an AWS SDK (p. 1212)
- Generate a Kinesis stream with stock ticker data using an AWS SDK (p. 1213)
- Generate a Kinesis stream with two data types using an AWS SDK (p. 1214)
- Generate a Kinesis stream with web log data using an AWS SDK (p. 1215)

## Generate a Kinesis stream with a referrer using an AWS SDK

The following code example shows how to generate a Kinesis stream with a referrer.

For more information, see [Example: Extracting a portion of a stream](#).

## List Lambda functions using an AWS SDK

The following code examples show how to list Lambda functions.

.NET

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;  
using System.Collections.Generic;  
using System.Threading.Tasks;  
using Amazon;  
using Amazon.Lambda;  
using Amazon.Lambda.Model;  
  
/// <summary>  
/// This example shows two ways to list the AWS Lambda functions you have  
/// created for your account. It will only list the functions within one  
/// AWS Region at a time, however, so you need to pass the AWS Region you  
/// are interested in to the Lambda client object constructor. This example  
/// was created with the AWS SDK for .NET version 3.7 and .NET Core 5.0.  
/// </summary>  
public class ListFunctions  
{  
    public static async Task Main()  
    {  
        // If the AWS Region you are interested in listing is the same as  
        // the AWS Region defined for the default user, you don't have to  
        // supply the RegionEndpoint constant to the constructor.  
        IAmazonLambda client = new AmazonLambdaClient(RegionEndpoint.USEast2);
```

```
// First use the ListFunctionsAsync method.  
var functions1 = await ListFunctionsAsync(client);  
  
DisplayFunctionList(functions1);  
  
// Get the list again useing a Lambda client paginator.  
var functions2 = await ListFunctionsPaginatorAsync(client);  
  
DisplayFunctionList(functions2);  
}  
  
/// <summary>  
/// Calls the asynchronous ListFunctionsAsync method of the Lambda  
/// client to retrieve the list of functions in the AWS Region with  
/// which the Lambda client was initialized.  
/// </summary>  
/// <param name="client">The initialized Lambda client which will be  
/// used to retrieve the list of Lambda functions.</param>  
/// <returns>A list of Lambda functions configuration information.</returns>  
public static async Task<List<FunctionConfiguration>>

## Scenarios for Lambda using AWS SDKs

The following code examples show how to use AWS Lambda with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Get started creating and invoking Lambda functions using an AWS SDK \(p. 1246\)](#)

## Get started creating and invoking Lambda functions using an AWS SDK

The following code examples show how to:

- Create an AWS Identity and Access Management (IAM) role that grants Lambda permission to write to logs.
- Create a Lambda function and upload handler code.
- Invoke the function with a single parameter and get results.

- Update the function code and configure its Lambda environment with an environment variable.
- Invoke the function with new parameters and get results. Display the execution log that's returned from the invocation.
- List the functions for your account.
- Delete the IAM role and the Lambda function.

For more information, see [Create a Lambda function with the console](#).

```

Define a Lambda handler that increments a number.

```
using Amazon.Lambda.Core;  
  
// Assembly attribute to enable the Lambda function's JSON input to be converted  
// into a .NET class.  
[assembly:  
LambdaSerializer(typeof(Amazon.Lambda.Serialization.SystemTextJson.DefaultLambdaJsonSerializer))]  
  
namespace LambdaIncrement;  
  
public class Function  
{  
  
    ///<summary>  
    /// A simple function increments the integer parameter.  
    ///</summary>  
    ///<param name="input">A JSON string containing an action, which must be  
    /// "increment" and a string representing the value to increment.</param>  
    ///<param name="context">The context object passed by Lambda containing  
    /// information about invocation, function, and execution environment.</param>  
    ///<returns>A string representing the incremented value of the parameter.</returns>  
    public int FunctionHandler(Dictionary<string, string> input, ILambdaContext context)  
    {  
        if (input["action"] == "increment")  
        {  
            int inputValue = Convert.ToInt32(input["x"]);  
            return inputValue + 1;  
        }  
        else  
        {  
            return 0;  
        }  
    }  
}
```

```
    }  
}
```

Define a second Lambda handler that performs arithmetic operations.

```
using Amazon.Lambda.Core;  
using System.Diagnostics;  
  
// Assembly attribute to enable the Lambda function's JSON input to be converted  
// into a .NET class.  
[assembly:  
    LambdaSerializer(typeof(Amazon.Lambda.Serialization.SystemTextJson.DefaultLambdaJsonSerializer))]  
  
namespace LambdaCalculator;  
  
public class Function  
{  
  
    /// <summary>  
    /// A simple function that takes two number in string format and performs  
    /// the requested arithmetic function.  
    /// </summary>  
    /// <param name="input">JSON data containing an action, and x and y values.  
    /// Valid actions include: add, subtract, multiply, and divide.</param>  
    /// <param name="context">The context object passed by Lambda containing  
    /// information about invocation, function, and execution environment.</param>  
    /// <returns>A string representing the results of the calculation.</returns>  
    public int FunctionHandler(Dictionary<string, string> input, ILambdaContext  
context)  
    {  
        var action = input["action"];  
        int x = Convert.ToInt32(input["x"]);  
        int y = Convert.ToInt32(input["y"]);  
        int result;  
        switch (action)  
        {  
            case "add":  
                result = x + y;  
                break;  
            case "subtract":  
                result = x - y;  
                break;  
            case "multiply":  
                result = x * y;  
                break;  
            case "divide":  
                if (y == 0)  
                {  
                    Console.Error.WriteLine("Divide by zero error.");  
                    result = 0;  
                }  
                else  
                    result = x / y;  
                break;  
            default:  
                Console.Error.WriteLine($"{action} is not a valid operation.");  
                result = 0;  
                break;  
        }  
        return result;

```
/*
 * Lambda function names appear as:
 *
 * arn:aws:lambda:us-west-2:335556666777:function:HelloFunction
 *
 * To find this value, look at the function in the AWS Management Console.
 *
 * Before running this Java code example, set up your development environment,
 * including your credentials.
 *
 * For more information, see this documentation topic:
 *
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-
started.html
 *
 * This example performs the following tasks:
 *
 * 1. Creates an AWS Lambda function.
 * 2. Gets a specific AWS Lambda function.
 * 3. Lists all Lambda functions.
 * 4. Invokes a Lambda function.
 * 5. Updates the Lambda function code and invokes it again.
 * 6. Updates a Lambda function's configuration value.
 * 7. Deletes a Lambda function.
 */

## JavaScript

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create an AWS Identity and Access Management (IAM) role that grants Lambda permission to write to logs.

```
log(`Creating role (${NAME_ROLE_LAMBDA})...`);  
const response = await createRole({  
    AssumeRolePolicyDocument: parseString({  
        Version: "2012-10-17",  
        Statement: [  
            {  
                Effect: "Allow",  
                Principal: {  
                    Service: "lambda.amazonaws.com",  
                },  
                Action: "sts:AssumeRole",  
            },  
        ],  
    }),  
    RoleName: NAME_ROLE_LAMBDA,  
});  
  
const attachRolePolicy = async (roleName, policyArn) => {  
    const client = createClientForDefaultRegion(IAMClient);  
    const command = new AttachRolePolicyCommand({  
        PolicyArn: policyArn, // For example, arn:aws:iam::aws:policy/service-role/  
        AWSLambdaBasicExecutionRole  
        RoleName: roleName, // For example, lambda-basic-execution-role  
    });  
  
    return client.send(command);  
};
```

Create a Lambda function and upload handler code.

```
const createFunction = async (funcName, roleArn) => {  
    const client = createClientForDefaultRegion(LambdaClient);  
    const code = await zip(`${dirname}..functions/${funcName}`);  
  
    const command = new CreateFunctionCommand({  
        Code: { ZipFile: code },  
        FunctionName: funcName,  
        Role: roleArn,  
        Architectures: [Architecture.arm64],  
        Handler: "index.handler", // Required when sending a .zip file  
        PackageType: PackageType.Zip, // Required when sending a .zip file  
        Runtime: Runtime.nodejs16x, // Required when sending a .zip file  
    });  
  
    return client.send(command);  
};
```

Invoke the function with a single parameter and get results.

```
const invoke = async (funcName, payload) => {
```

```
const client = createClientForDefaultRegion(LambdaClient);
const command = new InvokeCommand({
  FunctionName: funcName,
  Payload: JSON.stringify(payload),
  LogType: LogType.Tail,
});

const { Payload, LogResult } = await client.send(command);
const result = Buffer.from(Payload).toString();
const logs = Buffer.from(LogResult, "base64").toString();
return { logs, result };
};
```

Update the function code and configure its Lambda environment with an environment variable.

```
const updateFunctionCode = async (funcName, newFunc) => {
  const client = createClientForDefaultRegion(LambdaClient);
  const code = await zip(`.${dirname}..functions/${newFunc}`);
  const command = new UpdateFunctionCodeCommand({
    ZipFile: code,
    FunctionName: funcName,
    Architectures: [Architecture.arm64],
    Handler: "index.handler", // Required when sending a .zip file
    PackageType: PackageType.Zip, // Required when sending a .zip file
    Runtime: Runtime.nodejs16x, // Required when sending a .zip file
  });

  return client.send(command);
};

const updateFunctionConfiguration = async (funcName) => {
  const client = createClientForDefaultRegion(LambdaClient);
  const config = readFileSync(
    `${dirname}..functions/${funcName}/config.json`
  ).toString();
  const command = new UpdateFunctionConfigurationCommand({
    ...JSON.parse(config),
    FunctionName: funcName,
  });
  return client.send(command);
};
```

List the functions for your account.

```
const listFunctions = async () => {
  const client = createClientForDefaultRegion(LambdaClient);
  const command = new ListFunctionsCommand({});

  return client.send(command);
};
```

Delete the IAM role and the Lambda function.

```
const deleteRole = (roleName) => {
  const client = createClientForDefaultRegion(IAMClient);
  const command = new DeleteRoleCommand({ RoleName: roleName });
  return client.send(command);
};
```

```
const deleteFunction = (funcName) => {
  const client = createClientForDefaultRegion(LambdaClient);
  const command = new DeleteFunctionCommand({ FunctionName: funcName });
  return client.send(command);
};
```

```
suspend fun main(args: Array<String>) {

    val usage = """
        Usage:
            <functionName> <role> <handler> <bucketName> <updatedBucketName> <key>

        Where:
            functionName - The name of the AWS Lambda function.
            role - The AWS Identity and Access Management (IAM) service role that
                  has AWS Lambda permissions.
            handler - The fully qualified method name (for example,
                      example.Handler::handleRequest).
            bucketName - The Amazon Simple Storage Service (Amazon S3) bucket name
                         that contains the ZIP or JAR used for the Lambda function's code.
            updatedBucketName - The Amazon S3 bucket name that contains the .zip
                                or .jar used to update the Lambda function's code.
            key - The Amazon S3 key name that represents the .zip or .jar file (for
                  example, LambdaHello-1.0-SNAPSHOT.jar).
        """

## Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Define a Lambda handler that increments a number.

```
import logging

logger = logging.getLogger()
logger.setLevel(logging.INFO)
```

```
def lambda_handler(event, context):
    """
        Accepts an action and a single number, performs the specified action on the
        number,
        and returns the result. The only allowable action is 'increment'.

        :param event: The event dict that contains the parameters sent when the
                      function
                           is invoked.
        :param context: The context in which the function is called.
        :return: The result of the action.
    """
    result = None
    action = event.get('action')
    if action == 'increment':
        result = event.get('number', 0) + 1
        logger.info('Calculated result of %s', result)
    else:
        logger.error("%s is not a valid action.", action)

    response = {'result': result}
    return response
```

Define a second Lambda handler that performs arithmetic operations.

```
import logging
import os

logger = logging.getLogger()

# Define a list of Python lambda functions that are called by this AWS Lambda
# function.
ACTIONS = {
    'plus': lambda x, y: x + y,
    'minus': lambda x, y: x - y,
    'times': lambda x, y: x * y,
    'divided-by': lambda x, y: x / y}

def lambda_handler(event, context):
    """
        Accepts an action and two numbers, performs the specified action on the
        numbers,
        and returns the result.

        :param event: The event dict that contains the parameters sent when the
                      function
                           is invoked.
        :param context: The context in which the function is called.
        :return: The result of the specified action.
    """
    # Set the log level based on a variable configured in the Lambda environment.
    logger.setLevel(os.environ.get('LOG_LEVEL', logging.INFO))
    logger.debug('Event: %s', event)

    action = event.get('action')

Define a Lambda handler that increments a number provided as an invocation parameter.

```
require "logger"

# A function that increments a whole number by one (1) and logs the result.
# Requires a manually-provided runtime parameter, 'number', which must be Int
#
# @param event [Hash] Parameters sent when the function is invoked
# @param context [Hash] Methods and properties that provide information
# about the invocation, function, and execution environment.
# @return incremented_number [String] The incremented number.
def lambda_handler(event:, context:)
    logger = Logger.new($stdout)
    log_level = ENV["LOG_LEVEL"]
    logger.level = case log_level
        when "debug"
            Logger::DEBUG
        when "info"
            Logger::INFO
        else
            Logger::ERROR
        end
    logger.debug("This is a debug log message.")
    logger.info("This is an info log message. Code executed successfully!")
    number = event["number"].to_i
    incremented_number = number + 1
    logger.info("You provided #{number.round} and it was incremented to
#{incremented_number.round}")
    incremented_number.round.to_s
end
```

Zip your Lambda function into a deployment package.

```
# Creates a Lambda deployment package in .zip format.
# This zip can be passed directly as a string to Lambda when creating the
function.
#
# @param source_file: The name of the object, without suffix, for the Lambda file
and zip.
# @return: The deployment package.
def create_deployment_package(source_file)
    Dir.chdir(File.dirname(__FILE__))
    if File.exist?("lambda_function.zip")
```

```

    File.delete("lambda_function.zip")
    @logger.debug("Deleting old zip: lambda_function.zip")
end

File.read("lambda_function.zip").to_s
rescue StandardError => e
    @logger.error("There was an error creating deployment package:\n #{e.message}")
end

```

Create a new Lambda function.

```

# Deploys a Lambda function.
#
# @param function_name: The name of the Lambda function.
# @param handler_name: The fully qualified name of the handler function. This
#                      must include the file name and the function name.
# @param role_arn: The IAM role to use for the function.
# @param deployment_package: The deployment package that contains the function
#                           code in .zip format.
# @return: The Amazon Resource Name (ARN) of the newly created function.
def create_function(function_name, handler_name, role_arn, deployment_package)
    response = @lambda_client.create_function({
        role: role_arn.to_s,
        function_name:,
        handler: handler_name,
        runtime: "ruby2.7",
        code: {
            zip_file: deployment_package
        },
        environment: {
            variables: {
                "LOG_LEVEL" => "info"
            }
        }
    })
    @lambda_client.wait_until(:function_active_v2, { function_name: }) do |w|
        w.max_attempts = 5
        w.delay = 5
    end

#{e.message}")
end

```

Invoke your Lambda function with optional runtime parameters.

```

# Invokes a Lambda function.
# @param function_name [String] The name of the function to invoke.
# @param payload [nil] Payload containing runtime parameters.
# @return [Object] The response from the function invocation.
def invoke_function(function_name, payload = nil)
    params = { function_name: }
    params[:payload] = payload unless payload.nil?
    @lambda_client.invoke(params)

```

```
rescue Aws::Lambda::Errors::ServiceException => e
  @logger.error("There was an error executing #{function_name}:\n #{e.message}")
end
```

Update your Lambda function's configuration to inject a new environment variable.

```
# Updates the environment variables for a Lambda function.
# @param function_name: The name of the function to update.
# @param log_level: The log level of the function.
# @return: Data about the update, including the status.
def update_function_configuration(function_name, log_level)
  @lambda_client.update_function_configuration({
    function_name:,
    environment: {
      variables: {
        "LOG_LEVEL" => log_level
      }
    }
  })
  @lambda_client.wait_until(:function_updated_v2, { function_name: }) do |w|
    w.max_attempts = 5
    w.delay = 5
  end
  rescue Aws::Lambda::Errors::ServiceException => e
    @logger.error("There was an error updating configurations for #{function_name}:
\n #{e.message}")
  rescue Aws::Waiters::Errors::WaiterFailed => e
    @logger.error("Failed waiting for #{function_name} to activate:\n
#{e.message}")
  end
```

Update your Lambda function's code with a different deployment package containing different code.

```
# Updates the code for a Lambda function by submitting a .zip archive that
contains
# the code for the function.

# @param function_name: The name of the function to update.
# @param deployment_package: The function code to update, packaged as bytes in
#                           .zip format.
# @return: Data about the update, including the status.
def update_function_code(function_name, deployment_package)
  @lambda_client.update_function_code(
    function_name:,
    zip_file: deployment_package
  )
  @lambda_client.wait_until(:function_updated_v2, { function_name: }) do |w|
    w.max_attempts = 5
    w.delay = 5
  end
  rescue Aws::Lambda::Errors::ServiceException => e
    @logger.error("There was an error updating function code for: #{function_name}:
\n #{e.message}")
    nil
  rescue Aws::Waiters::Errors::WaiterFailed => e
    @logger.error("Failed waiting for #{function_name} to update:\n
#{e.message}")
  end
```

List all existing Lambda functions using the built-in paginator.

```
# Lists the Lambda functions for the current account.
def list_functions
  functions = []
  @lambda_client.list_functions.each do |response|
    response["functions"].each do |function|
      functions.append(function["function_name"])
    end
  end
  functions
rescue Aws::Lambda::Errors::ServiceException => e
  @logger.error("There was an error executing #{function_name}:\n #{e.message}")
end
```

Delete a specific Lambda function.

```
# Deletes a Lambda function.
# @param function_name: The name of the function to delete.
def delete_function(function_name)
  print "Deleting function: #{function_name}..."
  @lambda_client.delete_function(
    function_name:
  )
  print "Done!".green
rescue Aws::Lambda::Errors::ServiceException => e
  @logger.error("There was an error deleting #{function_name}:\n #{e.message}")
end
```

## Cross-service examples for Lambda using AWS SDKs

The following code examples show how to use AWS Lambda with AWS SDKs. Each example contains a sample application that works across multiple AWS services.

### Examples

- [Create an API Gateway REST API to track COVID-19 data \(p. 1283\)](#)
- [Create a lending library REST API \(p. 1283\)](#)
- [Create a messenger application with Step Functions \(p. 1284\)](#)
- [Create a websocket chat application with API Gateway \(p. 1284\)](#)
- [Invoke a Lambda function from a browser \(p. 1285\)](#)
- [Use API Gateway to invoke a Lambda function \(p. 1285\)](#)
- [Use Step Functions to invoke Lambda functions \(p. 1287\)](#)
- [Use scheduled events to invoke a Lambda function \(p. 1288\)](#)

## Create an API Gateway REST API to track COVID-19 data

The following code example shows how to create a REST API that simulates a system to track daily cases of COVID-19 in the United States, using fictional data.

Python

### SDK for Python (Boto3)

Shows how to use AWS Chalice with the AWS SDK for Python (Boto3) to create a serverless REST API that uses Amazon API Gateway, AWS Lambda, and Amazon DynamoDB. The REST API simulates a system that tracks daily cases of COVID-19 in the United States, using fictional data. Learn how to:

- Use AWS Chalice to define routes in Lambda functions that are called to handle REST requests that come through API Gateway.
- Use Lambda functions to retrieve and store data in a DynamoDB table to serve REST requests.
- Define table structure and security role resources in an AWS CloudFormation template.
- Use AWS Chalice and CloudFormation to package and deploy all necessary resources.
- Use CloudFormation to clean up all created resources.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- API Gateway
- AWS CloudFormation
- DynamoDB
- Lambda

## Create a lending library REST API

The following code example shows how to create a lending library where patrons can borrow and return books by using a REST API backed by an Amazon Aurora database.

Python

### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) with the Amazon Relational Database Service (Amazon RDS) API and AWS Chalice to create a REST API backed by an Amazon Aurora database. The web service is fully serverless and represents a simple lending library where patrons can borrow and return books. Learn how to:

- Create and manage a serverless Aurora database cluster.
- Use AWS Secrets Manager to manage database credentials.
- Implement a data storage layer that uses Amazon RDS to move data into and out of the database.
- Use AWS Chalice to deploy a serverless REST API to Amazon API Gateway and AWS Lambda.
- Use the Requests package to send requests to the web service.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- API Gateway
- Lambda
- Amazon RDS
- Secrets Manager

## Create a messenger application with Step Functions

The following code example shows how to create an AWS Step Functions messenger application that retrieves message records from a database table.

Python

#### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) with AWS Step Functions to create a messenger application that retrieves message records from an Amazon DynamoDB table and sends them with Amazon Simple Queue Service (Amazon SQS). The state machine integrates with an AWS Lambda function to scan the database for unsent messages.

- Create a state machine that retrieves and updates message records from an Amazon DynamoDB table.
- Update the state machine definition to also send messages to Amazon Simple Queue Service (Amazon SQS).
- Start and stop state machine runs.
- Connect to Lambda, DynamoDB, and Amazon SQS from a state machine by using service integrations.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- DynamoDB
- Lambda
- Amazon SQS
- Step Functions

## Create a websocket chat application with API Gateway

The following code example shows how to create a chat application that is served by a websocket API built on Amazon API Gateway.

## Python

### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) with Amazon API Gateway V2 to create a websocket API that integrates with AWS Lambda and Amazon DynamoDB.

- Create a websocket API served by API Gateway.
- Define a Lambda handler that stores connections in DynamoDB and posts messages to other chat participants.
- Connect to the websocket chat application and send messages with the Websockets package.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- API Gateway
- DynamoDB
- Lambda

## Invoke a Lambda function from a browser

The following code example shows how to invoke an AWS Lambda function from a browser.

### JavaScript

#### SDK for JavaScript V2

You can create a browser-based application that uses an AWS Lambda function to update an Amazon DynamoDB table with user selections.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- DynamoDB
- Lambda

#### SDK for JavaScript V3

You can create a browser-based application that uses an AWS Lambda function to update an Amazon DynamoDB table with user selections. This app uses AWS SDK for JavaScript v3.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- DynamoDB
- Lambda

## Use API Gateway to invoke a Lambda function

The following code examples show how to create an AWS Lambda function invoked by Amazon API Gateway.

## Java

### SDK for Java 2.x

Shows how to create an AWS Lambda function by using the Lambda Java runtime API. This example invokes different AWS services to perform a specific use case. This example demonstrates how to create a Lambda function invoked by Amazon API Gateway that scans an Amazon DynamoDB table for work anniversaries and uses Amazon Simple Notification Service (Amazon SNS) to send a text message to your employees that congratulates them at their one year anniversary date.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- API Gateway
- DynamoDB
- Lambda
- Amazon SNS

## JavaScript

### SDK for JavaScript V3

Shows how to create an AWS Lambda function by using the Lambda JavaScript runtime API. This example invokes different AWS services to perform a specific use case. This example demonstrates how to create a Lambda function invoked by Amazon API Gateway that scans an Amazon DynamoDB table for work anniversaries and uses Amazon Simple Notification Service (Amazon SNS) to send a text message to your employees that congratulates them at their one year anniversary date.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

This example is also available in the [AWS SDK for JavaScript v3 developer guide](#).

#### Services used in this example

- API Gateway
- DynamoDB
- Lambda
- Amazon SNS

## Python

### SDK for Python (Boto3)

This example shows how to create and use an Amazon API Gateway REST API that targets an AWS Lambda function. The Lambda handler demonstrates how to route based on HTTP methods; how to get data from the query string, header, and body; and how to return a JSON response.

- Deploy a Lambda function.
- Create an API Gateway REST API.
- Create a REST resource that targets the Lambda function.

- Grant permission to let API Gateway invoke the Lambda function.
- Use the Requests package to send requests to the REST API.
- Clean up all resources created during the demo.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### **Services used in this example**

- API Gateway
- Lambda

## Use Step Functions to invoke Lambda functions

The following code examples show how to create an AWS Step Functions state machine that invokes AWS Lambda functions in sequence.

Java

#### **SDK for Java 2.x**

Shows how to create an AWS serverless workflow by using AWS Step Functions and the AWS SDK for Java 2.x. Each workflow step is implemented using an AWS Lambda function.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### **Services used in this example**

- DynamoDB
- Lambda
- Amazon SES
- Step Functions

JavaScript

#### **SDK for JavaScript V3**

Shows how to create an AWS serverless workflow by using AWS Step Functions and the AWS SDK for JavaScript. Each workflow step is implemented using an AWS Lambda function.

Lambda is a compute service that enables you to run code without provisioning or managing servers. Step Functions is a serverless orchestration service that lets you combine Lambda functions and other AWS services to build business-critical applications.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

This example is also available in the [AWS SDK for JavaScript v3 developer guide](#).

#### **Services used in this example**

- DynamoDB
- Lambda
- Amazon SES
- Step Functions

## Use scheduled events to invoke a Lambda function

The following code examples show how to create an AWS Lambda function invoked by an Amazon EventBridge scheduled event.

Java

### SDK for Java 2.x

Shows how to create an Amazon EventBridge scheduled event that invokes an AWS Lambda function. Configure EventBridge to use a cron expression to schedule when the Lambda function is invoked. In this example, you create a Lambda function by using the Lambda Java runtime API. This example invokes different AWS services to perform a specific use case. This example demonstrates how to create an app that sends a mobile text message to your employees that congratulates them at the one year anniversary date.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- DynamoDB
- EventBridge
- Lambda
- Amazon SNS

JavaScript

### SDK for JavaScript V3

Shows how to create an Amazon EventBridge scheduled event that invokes an AWS Lambda function. Configure EventBridge to use a cron expression to schedule when the Lambda function is invoked. In this example, you create a Lambda function by using the Lambda JavaScript runtime API. This example invokes different AWS services to perform a specific use case. This example demonstrates how to create an app that sends a mobile text message to your employees that congratulates them at the one year anniversary date.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

This example is also available in the [AWS SDK for JavaScript v3 developer guide](#).

#### Services used in this example

- DynamoDB
- EventBridge
- Lambda
- Amazon SNS

Python

### SDK for Python (Boto3)

This example shows how to register an AWS Lambda function as the target of a scheduled Amazon EventBridge event. The Lambda handler writes a friendly message and the full event data to Amazon CloudWatch Logs for later retrieval.

- Deploys a Lambda function.
- Creates an EventBridge scheduled event and makes the Lambda function the target.

- Grants permission to let EventBridge invoke the Lambda function.
- Prints the latest data from CloudWatch Logs to show the result of the scheduled invocations.
- Cleans up all resources created during the demo.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- CloudWatch Logs
- EventBridge
- Lambda

## Code examples for Amazon Lex using AWS SDKs

The following code examples show how to use Amazon Lex with an AWS software development kit (SDK).

#### Code examples

- [Cross-service examples for Amazon Lex using AWS SDKs \(p. 1289\)](#)
  - [Create an Amazon Lex Chatbot within a web application to engage your web site visitors \(p. 1289\)](#)

## Cross-service examples for Amazon Lex using AWS SDKs

The following code examples show how to use Amazon Lex with AWS SDKs. Each example contains a sample application that works across multiple AWS services.

#### Examples

- [Create an Amazon Lex Chatbot within a web application to engage your web site visitors \(p. 1289\)](#)

## Create an Amazon Lex Chatbot within a web application to engage your web site visitors

The following code examples show how to create a Chatbot to engage your web site visitors.

Java

#### SDK for Java 2.x

Shows how to use the Amazon Lex API to create a Chatbot within a web application to engage your web site visitors.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Comprehend
- Amazon Lex
- Amazon Translate

## JavaScript

### SDK for JavaScript V3

Shows how to use the Amazon Lex API to create a Chatbot within a web application to engage your web site visitors.

For complete source code and instructions on how to set up and run, see the full example [Building an Amazon Lex chatbot](#) in the AWS SDK for JavaScript developer guide.

#### Services used in this example

- Amazon Comprehend
- Amazon Lex
- Amazon Translate

## Code examples for Lookout for Vision using AWS SDKs

The following code examples show how to use Amazon Lookout for Vision with an AWS software development kit (SDK).

#### Code examples

- [Actions for Lookout for Vision using AWS SDKs \(p. 1290\)](#)
  - Create a Lookout for Vision dataset using an AWS SDK (p. 1291)
  - Create a Lookout for Vision model using an AWS SDK (p. 1292)
  - Create a Lookout for Vision project using an AWS SDK (p. 1294)
  - Delete a Lookout for Vision dataset using an AWS SDK (p. 1294)
  - Delete a Lookout for Vision model using an AWS SDK (p. 1295)
  - Delete a Lookout for Vision project using an AWS SDK (p. 1296)
  - Describe a Lookout for Vision dataset using an AWS SDK (p. 1296)
  - Describe a Lookout for Vision model using an AWS SDK (p. 1297)
  - Detect anomalies in an image with a trained Lookout for Vision model using an AWS SDK (p. 1298)
  - List Lookout for Vision models using an AWS SDK (p. 1303)
  - List Lookout for Vision projects using an AWS SDK (p. 1304)
  - Start a Lookout for Vision model using an AWS SDK (p. 1305)
  - Stop a Lookout for Vision model using an AWS SDK (p. 1306)
- [Scenarios for Lookout for Vision using AWS SDKs \(p. 1307\)](#)
  - Create a Lookout for Vision manifest file using an AWS SDK (p. 1307)
  - Create, train, and start a Lookout for Vision model using an AWS SDK (p. 1309)
  - Find a Lookout for Vision project with a specific tag using an AWS SDK (p. 1309)
  - List Lookout for Vision models that are currently hosted using an AWS SDK (p. 1311)

## Actions for Lookout for Vision using AWS SDKs

The following code examples show how to use Amazon Lookout for Vision with AWS SDKs. Each example calls an individual service function.

## Examples

- [Create a Lookout for Vision dataset using an AWS SDK \(p. 1291\)](#)
- [Create a Lookout for Vision model using an AWS SDK \(p. 1292\)](#)
- [Create a Lookout for Vision project using an AWS SDK \(p. 1294\)](#)
- [Delete a Lookout for Vision dataset using an AWS SDK \(p. 1294\)](#)
- [Delete a Lookout for Vision model using an AWS SDK \(p. 1295\)](#)
- [Delete a Lookout for Vision project using an AWS SDK \(p. 1296\)](#)
- [Describe a Lookout for Vision dataset using an AWS SDK \(p. 1296\)](#)
- [Describe a Lookout for Vision model using an AWS SDK \(p. 1297\)](#)
- [Detect anomalies in an image with a trained Lookout for Vision model using an AWS SDK \(p. 1298\)](#)
- [List Lookout for Vision models using an AWS SDK \(p. 1303\)](#)
- [List Lookout for Vision projects using an AWS SDK \(p. 1304\)](#)
- [Start a Lookout for Vision model using an AWS SDK \(p. 1305\)](#)
- [Stop a Lookout for Vision model using an AWS SDK \(p. 1306\)](#)

## Create a Lookout for Vision dataset using an AWS SDK

The following code example shows how to create a Lookout for Vision dataset.

For more information, see [Creating your dataset](#).

Python

### SDK for Python (Boto3)

#### Note

## Create, train, and start a Lookout for Vision model using an AWS SDK

The following code example shows how to create, train, and start a Lookout for Vision model.

Python

### SDK for Python (Boto3)

Creates and optionally starts an Amazon Lookout for Vision model using command line arguments. The example code creates a new project, training dataset, optional test dataset, and model. After model training is completed, you can use a provided script to try your model with an image.

This example requires a set of images to train its model. You can find example circuit board images on GitHub that you can use for training and testing. For details on how to copy these images to an Amazon Simple Storage Service (Amazon S3) bucket, see [Prepare example images](#).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Lookout for Vision

## Find a Lookout for Vision project with a specific tag using an AWS SDK

The following code example shows how to find a Lookout for Vision project with a specific tag.

For more information, see [Tagging models](#).

## Python

### SDK for Python (Boto3)

#### Note

  - [Update a campaign in Amazon Personalize using an AWS SDK \(p. 1362\)](#)

## Actions for Amazon Personalize using AWS SDKs

The following code examples show how to use Amazon Personalize with AWS SDKs. Each example calls an individual service function.

### Examples

- [Create a batch inference job with Amazon Personalize using an AWS SDK \(p. 1332\)](#)
- [Create a batch segment job with Amazon Personalize using an AWS SDK \(p. 1335\)](#)
- [Create a campaign with Amazon Personalize using an AWS SDK \(p. 1336\)](#)
- [Create a dataset with Amazon Personalize using an AWS SDK \(p. 1337\)](#)
- [Create a dataset export job with Amazon Personalize using an AWS SDK \(p. 1338\)](#)

- Create a dataset group with Amazon Personalize using an AWS SDK (p. 1340)
- Create a dataset import job with Amazon Personalize using an AWS SDK (p. 1342)
- Create a domain schema with Amazon Personalize using an AWS SDK (p. 1344)
- Create a filter with Amazon Personalize using an AWS SDK (p. 1346)
- Create a recommender with Amazon Personalize using an AWS SDK (p. 1347)
- Create a schema with Amazon Personalize using an AWS SDK (p. 1349)
- Create a solution with Amazon Personalize using an AWS SDK (p. 1350)
- Create a solution version with Amazon Personalize using an AWS SDK (p. 1351)
- Create an event tracker with Amazon Personalize using an AWS SDK (p. 1354)
- Delete a campaign in Amazon Personalize using an AWS SDK (p. 1355)
- Delete a solution in Amazon Personalize using an AWS SDK (p. 1356)
- Delete an event tracker in Amazon Personalize using an AWS SDK (p. 1356)
- Describe a campaign in Amazon Personalize using an AWS SDK (p. 1357)
- Describe a recipe in Amazon Personalize using an AWS SDK (p. 1358)
- Describe a solution in Amazon Personalize using an AWS SDK (p. 1358)
- Incrementally import an item into Amazon Personalize Events using an AWS SDK (p. 1359)
- List campaigns in Amazon Personalize using an AWS SDK (p. 1360)
- List dataset groups in Amazon Personalize using an AWS SDK (p. 1360)
- List recipes in Amazon Personalize using an AWS SDK (p. 1361)
- List solutions in Amazon Personalize using an AWS SDK (p. 1362)
- Update a campaign in Amazon Personalize using an AWS SDK (p. 1362)

## Create a batch inference job with Amazon Personalize using an AWS SDK

The following code examples show how to create a Amazon Personalize batch interface job.

Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String createPersonalizeBatchInferenceJob(PersonalizeClient
personalizeClient,
                                         String
solutionVersionArn,
                                         String jobName,
String
s3InputDataSourcePath,
                                         String
s3DataDestinationPath,
                                         String roleArn,
String

## Get recommendations from a campaign created in a custom dataset group with Amazon Personalize Runtime using an AWS SDK

The following code examples show how to get Amazon Personalize Runtime Runtime recommendations.

## Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Get a list of recommended items.

```
public static void getRecs(PersonalizeRuntimeClient personalizeRuntimeClient,
  String campaignArn, String userId){
```

```

try {
    GetRecommendationsRequest recommendationsRequest =
GetRecommendationsRequest.builder()
    .campaignArn(campaignArn)
    .numResults(20)
    .userId(userId)
    .build();

    GetRecommendationsResponse recommendationsResponse =
personalizeRuntimeClient.getRecommendations(recommendationsRequest);
    List<PredictedItem> items = recommendationsResponse.itemList();
    for (PredictedItem item: items) {
        System.out.println("Item Id is : "+item.itemId());
        System.out.println("Item score is : "+item.score());
    }

} catch (AwsServiceException e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}
}

```

Get a list of recommended items from a recommender created in a domain dataset group.

```

public static void getRecs(PersonalizeRuntimeClient personalizeRuntimeClient,
String recommenderArn, String userId){

    try {
        GetRecommendationsRequest recommendationsRequest =
GetRecommendationsRequest.builder()
    .recommenderArn(recommenderArn)
    .numResults(20)
    .userId(userId)
    .build();

        GetRecommendationsResponse recommendationsResponse =
personalizeRuntimeClient.getRecommendations(recommendationsRequest);
        List<PredictedItem> items = recommendationsResponse.itemList();

        for (PredictedItem item: items) {
            System.out.println("Item Id is : "+item.itemId());
            System.out.println("Item score is : "+item.score());
        }

    } catch (AwsServiceException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}

```

Use a filter when requesting recommendations.

```

public static void getFilteredRecs(PersonalizeRuntimeClient
personalizeRuntimeClient,
                                    String campaignArn,
                                    String userId,
                                    String filterArn,
                                    String parameter1Name,
                                    String parameter1Value1,
                                    String parameter1Value2,
                                    String parameter2Name,
                                    String parameter2Value){

```

```
try {

    Map<String, String> filterValues = new HashMap<>();

    filterValues.put(parameter1Name, String.format("\\"%1$s\\",\\"%2$s\\",
        parameter1Value1, parameter1Value2));
    filterValues.put(parameter2Name, String.format("\\"%1$s\\",
        parameter2Value));

    GetRecommendationsRequest recommendationsRequest =
GetRecommendationsRequest.builder()
    .campaignArn(campaignArn)
    .numResults(20)
    .userId(userId)
    .filterArn(filterArn)
    .filterValues(filterValues)
    .build();

    GetRecommendationsResponse recommendationsResponse =
personalizeRuntimeClient.getRecommendations(recommendationsRequest);
    List<PredictedItem> items = recommendationsResponse.itemList();

    for (PredictedItem item: items) {
        System.out.println("Item Id is : "+item.itemId());
        System.out.println("Item score is : "+item.score());
    }
} catch (PersonalizeRuntimeException e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}
}
```

- For API details, see [GetRecommendations](#) in *AWS SDK for Java 2.x API Reference*.

## JavaScript

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Get service clients module and commands using ES6 syntax.
import { GetRecommendationsCommand } from

## Code examples for Amazon Pinpoint using AWS SDKs

The following code examples show how to use Amazon Pinpoint with an AWS software development kit (SDK).

### Code examples

- [Actions for Amazon Pinpoint using AWS SDKs \(p. 1373\)](#)
  - [Create an Amazon Pinpoint campaign \(p. 1374\)](#)
  - [Create an Amazon Pinpoint segment \(p. 1376\)](#)
  - [Create an Amazon Pinpoint application \(p. 1378\)](#)
  - [Delete an Amazon Pinpoint application \(p. 1379\)](#)
  - [Delete an Amazon Pinpoint endpoint \(p. 1380\)](#)
  - [Export an Amazon Pinpoint endpoint \(p. 1381\)](#)
  - [Display information about an existing Amazon Pinpoint endpoint \(p. 1384\)](#)
  - [Import an Amazon Pinpoint segment \(p. 1385\)](#)
  - [List Amazon Pinpoint endpoints that are associated with a specific user ID \(p. 1386\)](#)
  - [List Amazon Pinpoint segments in an application \(p. 1387\)](#)
  - [Send email and text messages with Amazon Pinpoint using an AWS SDK \(p. 1388\)](#)
  - [Send templated email and text messages with Amazon Pinpoint using an AWS SDK \(p. 1401\)](#)
  - [Update an Amazon Pinpoint endpoint \(p. 1403\)](#)
  - [Update an Amazon Pinpoint channel \(p. 1405\)](#)

## Actions for Amazon Pinpoint using AWS SDKs

The following code examples show how to use Amazon Pinpoint with AWS SDKs. Each example calls an individual service function.

### Examples

- [Create an Amazon Pinpoint campaign \(p. 1374\)](#)
- [Create an Amazon Pinpoint segment \(p. 1376\)](#)
- [Create an Amazon Pinpoint application \(p. 1378\)](#)

- [Delete an Amazon Pinpoint application \(p. 1379\)](#)
- [Delete an Amazon Pinpoint endpoint \(p. 1380\)](#)
- [Export an Amazon Pinpoint endpoint \(p. 1381\)](#)
- [Display information about an existing Amazon Pinpoint endpoint \(p. 1384\)](#)
- [Import an Amazon Pinpoint segment \(p. 1385\)](#)
- [List Amazon Pinpoint endpoints that are associated with a specific user ID \(p. 1386\)](#)
- [List Amazon Pinpoint segments in an application \(p. 1387\)](#)
- [Send email and text messages with Amazon Pinpoint using an AWS SDK \(p. 1388\)](#)
- [Send templated email and text messages with Amazon Pinpoint using an AWS SDK \(p. 1401\)](#)
- [Update an Amazon Pinpoint endpoint \(p. 1403\)](#)
- [Update an Amazon Pinpoint channel \(p. 1405\)](#)

## Create an Amazon Pinpoint campaign

The following code examples show how to create a campaign.

Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a campaign.

```
public static void createPinCampaign(PinpointClient pinpoint, String appId,
String segmentId) {
    CampaignResponse result = createCampaign(pinpoint, appId, segmentId);
    System.out.println("Campaign " + result.name() + " created.");
    System.out.println(result.description());
}

public static CampaignResponse createCampaign(PinpointClient client, String
appID, String segmentID) {

    try {
        Schedule schedule = Schedule.builder()
            .startTime("IMMEDIATE")
            .build();

        Message defaultMessage = Message.builder()
            .action(Action.OPEN_APP)
            .body("My message body.")
            .title("My message title.")
            .build();

        MessageConfiguration messageConfiguration =
MessageConfiguration.builder()
            .defaultMessage(defaultMessage)
            .build();

        WriteCampaignRequest request = WriteCampaignRequest.builder()
            .description("My description")
            .schedule(schedule)
            .name("MyCampaign")
            .segmentId(segmentID)
    }
}
```

```
        .messageConfiguration(messageConfiguration)
        .build();

        CreateCampaignResponse result =
client.createCampaign(CreateCampaignRequest.builder()
                    .applicationId(appID)
                    .writeCampaignRequest(request).build()
            );
        System.out.println("Campaign ID: " + result.campaignResponse().id());
        return result.campaignResponse();

    } catch (PinpointException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }

    return null;
}
```

- For API details, see [CreateCampaign](#) in *AWS SDK for Java 2.x API Reference*.

## Kotlin

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun createPinCampaign(appId: String, segmentIdVal: String) {

    val schedule0b = Schedule {
        startTime = "IMMEDIATE"
    }

    val defaultMessage0b = Message {
        action = Action.OpenApp
        body = "My message body"
        title = "My message title"
    }

    val messageConfiguration0b = MessageConfiguration {
        defaultMessage = defaultMessage0b
    }

    val writeCampaign = WriteCampaignRequest {
        description = "My description"
        schedule = schedule0b
        name = "MyCampaign"

Create the client in a separate module and export it.

```
import { PinpointClient } from "@aws-sdk/client-pinpoint";
// Set the AWS Region.
const REGION = "us-east-1";
//Set the MediaConvert Service Object
const pinClient = new PinpointClient({region: REGION});
export { pinClient };
```

Send an email message.

```
// Import required AWS SDK clients and commands for Node.js
import { SendMessagesCommand } from "@aws-sdk/client-pinpoint";
import { pinClient } from "./libs/pinClient.js";

// The FromAddress must be verified in SES.
const fromAddress = "FROM_ADDRESS";
const toAddress = "TO_ADDRESS";
const projectId = "PINPOINT_PROJECT_ID";

// The subject line of the email.
var subject = "Amazon Pinpoint Test (AWS SDK for JavaScript in Node.js)";

// The email body for recipients with non-HTML email clients.
var body_text = `Amazon Pinpoint Test (SDK for JavaScript in Node.js)
-----
This email was sent with Amazon Pinpoint using the AWS SDK for JavaScript in
Node.js.
For more information, see https://aws.amazon.com/sdk-for-node-js/`;

// The body of the email for recipients whose email clients support HTML content.
var body_html = `<html>
<head></head>
<body>
  <h1>Amazon Pinpoint Test (SDK for JavaScript in Node.js)</h1>
  <p>This email was sent with
    <a href='https://aws.amazon.com/pinpoint/'>the Amazon Pinpoint Email API</a>
  using the
    <a href='https://aws.amazon.com/sdk-for-node-js/'>
      AWS SDK for JavaScript in Node.js</a>.</p>
</body>
</html>`;

// The character encoding for the subject line and message body of the email.
var charset = "UTF-8";

const params = {
  ApplicationId: projectId,

## Send templated email and text messages with Amazon Pinpoint using an AWS SDK

The following code example shows how to send templated email and text messages with Amazon Pinpoint.

Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Send an email message with an existing email template.

```
import logging
import boto3
from botocore.exceptions import ClientError

logger = logging.getLogger(__name__)

def send_templated_email_message(
    pinpoint_client, project_id, sender, to_addresses, template_name,
    template_version):
    """
    Sends an email message with HTML and plain text versions.

    :param pinpoint_client: A Boto3 Pinpoint client.
    :param project_id: The Amazon Pinpoint project ID to use when you send this
        message.
    :param sender: The "From" address. This address must be verified in
        Amazon Pinpoint in the AWS Region you're using to send email.
    :param to_addresses: The addresses on the "To" line. If your Amazon Pinpoint
        account is in the sandbox, these addresses must be
        verified.
    :param template_name: The name of the email template to use when sending the
        message.
    :param template_version: The version number of the message template.

    :return: A dict of to_addresses and their message IDs.
    """
    try:
        response = pinpoint_client.send_messages(
            ApplicationId=project_id,
            MessageRequest={
                'Addresses': {

## Start an Amazon Polly speech synthesis task using an AWS SDK

The following code example shows how to start an asynchronous Amazon Polly speech synthesis task.

Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class PollyWrapper:
```

```

"""Encapsulates Amazon Polly functions."""
def __init__(self, polly_client, s3_resource):
    """
    :param polly_client: A Boto3 Amazon Polly client.
    :param s3_resource: A Boto3 Amazon Simple Storage Service (Amazon S3)
    resource.
    """
    self.polly_client = polly_client
    self.s3_resource = s3_resource
    self.voice_metadata = None

    def do_synthesis_task(
        self, text, engine, voice, audio_format, s3_bucket, lang_code=None,
        include_visemes=False, wait_callback=None):
        """
        Start an asynchronous task to synthesize speech or speech marks, wait for
        the task to complete, retrieve the output from Amazon S3, and return the
        data.

        An asynchronous task is required when the text is too long for near-real
        time
        synthesis.

        :param text: The text to synthesize.
        :param engine: The kind of engine used. Can be standard or neural.
        :param voice: The ID of the voice to use.
        :param audio_format: The audio format to return for synthesized speech.
    When
                    speech marks are synthesized, the output format is
    JSON.
                    :param s3_bucket: The name of an existing Amazon S3 bucket that you have
                        write access to. Synthesis output is written to this
                        bucket.
                    :param lang_code: The language code of the voice to use. This has an effect
                        only when a bilingual voice is selected.
                    :param include_visemes: When True, a second request is made to Amazon Polly
                        to synthesize a list of visemes, using the
                        specified
                        text and voice. A viseme represents the visual
                        position
                        of the face and mouth when saying part of a word.
                    :param wait_callback: A callback function that is called periodically
                        during
                        task processing, to give the caller an opportunity to
                        take action, such as to display status.
    :return: The audio stream that contains the synthesized speech and a list
            of visemes that are associated with the speech audio.
    """

## Scenarios for Amazon Polly using AWS SDKs

The following code examples show how to use Amazon Polly with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Create a lip-sync application with Amazon Polly using an AWS SDK \(p. 1428\)](#)

## Create a lip-sync application with Amazon Polly using an AWS SDK

The following code example shows how to create a lip-sync application with Amazon Polly.

Python

### SDK for Python (Boto3)

Shows how to use Amazon Polly and Tkinter to create a lip-sync application that displays an animated face speaking along with the speech synthesized by Amazon Polly. Lip-sync is accomplished by requesting a list of visemes from Amazon Polly that match up with the synthesized speech.

- Get voice metadata from Amazon Polly and display it in a Tkinter application.
- Get synthesized speech audio and matching viseme speech marks from Amazon Polly.
- Play the audio with synchronized mouth movements in an animated face.
- Submit asynchronous synthesis tasks for long texts and retrieve the output from an Amazon Simple Storage Service (Amazon S3) bucket.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Polly

## Cross-service examples for Amazon Polly using AWS SDKs

The following code examples show how to use Amazon Polly with AWS SDKs. Each example contains a sample application that works across multiple AWS services.

### Examples

- [Convert text to speech and back to text using an AWS SDK \(p. 1428\)](#)

## Convert text to speech and back to text using an AWS SDK

The following code example shows how to:

- Use Amazon Polly to synthesize a plain text (UTF-8) input file to an audio file.
- Upload the audio file to an Amazon Simple Storage Service (Amazon S3) bucket.
- Use Amazon Transcribe to convert the audio file to text.
- Display the text.

Rust

#### SDK for Rust

##### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

Use Amazon Polly to synthesize a plain text (UTF-8) input file to an audio file, upload the audio file to an Amazon Simple Storage Service bucket, use Amazon Transcribe to convert that audio file to text, and display the text.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Polly
- Amazon S3
- Amazon Transcribe

## Code examples for QLDB using AWS SDKs

The following code examples show how to use Amazon QLDB with an AWS software development kit (SDK).

#### Code examples

- [Actions for QLDB using AWS SDKs \(p. 1429\)](#)
  - [Create a QLDB ledger using an AWS SDK \(p. 1429\)](#)
  - [List your QLDB ledgers using an AWS SDK \(p. 1430\)](#)

## Actions for QLDB using AWS SDKs

The following code examples show how to use Amazon QLDB with AWS SDKs. Each example calls an individual service function.

#### Examples

- [Create a QLDB ledger using an AWS SDK \(p. 1429\)](#)
- [List your QLDB ledgers using an AWS SDK \(p. 1430\)](#)

## Create a QLDB ledger using an AWS SDK

The following code example shows how to create a QLDB ledger.

Rust

#### SDK for Rust

##### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn make_ledger(client: &Client, ledger: &str) -> Result<(), Error> {
    let result = client
        .create_ledger()
        .name(ledger)
        .permissions_mode(PermissionsMode::AllowAll)
        .send()
        .await?;

    println!("ARN: {}", result.arn().unwrap());

    Ok(())
}
```

- For API details, see [CreateLedger](#) in *AWS SDK for Rust API reference*.

## List your QLDB ledgers using an AWS SDK

The following code example shows how to list your QLDB ledgers.

Rust

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn show_ledgers(client: &QLDBClient) -> Result<(), Error> {
    let mut pages = client.list_ledgers().into_paginator().page_size(2).send();

    while let Some(page) = pages.next().await {
        println!("* {:?}", page); //Prints an entire page of ledgers.
        for ledger in page.unwrap().ledgers().unwrap() {
            println!("* {:?}", ledger); //Prints the LedgerSummary of a single
        ledger.
        }
    }

    Ok(())
}
```

- For API details, see [ListLedgers](#) in *AWS SDK for Rust API reference*.

## Code examples for Amazon RDS using AWS SDKs

The following code examples show how to use Amazon Relational Database Service with an AWS software development kit (SDK).

### Code examples

## Reboot an Amazon RDS DB instance using an AWS SDK

The following code example shows how to reboot an Amazon RDS DB instance.

Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void rebootInstance(RdsClient rdsClient, String  
dbInstanceIdentifier ) {  
  
    try {  
        RebootDbInstanceRequest rebootDbInstanceRequest =  
RebootDbInstanceRequest.builder()  
            .dbInstanceIdentifier(dbInstanceIdentifier)  
            .build();  
  
        RebootDbInstanceResponse instanceResponse =  
rdsClient.rebootDBInstance(rebootDbInstanceRequest);  
        System.out.print("The database "+  
instanceResponse.dbInstance().dbInstanceArn() +" was rebooted");  
  
    } catch (RdsException e) {  
        System.out.println(e.getLocalizedMessage());  
        System.exit(1);  
    }  
}
```

```
}
```

- For API details, see [RebootDBInstance](#) in *AWS SDK for Java 2.x API Reference*.

## Retrieve attributes that belongs to an Amazon RDS account using an AWS SDK

The following code examples show how to retrieve attributes that belong to an Amazon RDS account.

Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void getAccountAttributes(RdsClient rdsClient) {  
  
    try {  
        DescribeAccountAttributesResponse response =  
rdsClient.describeAccountAttributes();  
        List<AccountQuota> quotasList = response.accountQuotas();  
        for (AccountQuota quotas: quotasList) {  
            System.out.println("Name is: "+quotas.accountQuotaName());  
            System.out.println("Max value is " +quotas.max());  
        }  
  
    } catch (RdsException e) {  
        System.out.println(e.getLocalizedMessage());  
        System.exit(1);  
    }  
}
```

## Scenarios for Amazon RDS using AWS SDKs

The following code examples show how to use Amazon Relational Database Service with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Get started with Amazon RDS DB instances using an AWS SDK \(p. 1462\)](#)

## Get started with Amazon RDS DB instances using an AWS SDK

The following code examples show how to:

- Create a custom DB parameter group and set parameter values.
- Create a DB instance that's configured to use the parameter group. The DB instance also contains a database.
- Take a snapshot of the instance.
- Delete the instance and parameter group.

### .NET

#### AWS SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Run an interactive scenario at a command prompt.

```
/// <summary>
/// Scenario for RDS DB instance example.
/// </summary>
public class RDSDatabaseScenario
{
    /*
     Before running this .NET code example, set up your development environment,
     including your credentials.

     This .NET example performs the following tasks:
     1. Returns a list of the available DB engine families using the
        DescribeDBEngineVersionsAsync method.
     2. Selects an engine family and creates a custom DB parameter group using the
        CreateDBParameterGroupAsync method.
     3. Gets the parameter groups using the DescribeDBParameterGroupsAsync method.
```

```
    4. Gets parameters in the group using the DescribeDBParameters method.
    5. Parses and displays parameters in the group.
    6. Modifies both the auto_increment_offset and auto_increment_increment
parameters
        using the ModifyDBParameterGroupAsync method.
    7. Gets and displays the updated parameters using the DescribeDBParameters
method with a source of "user".
    8. Gets a list of allowed engine versions using the
DescribeDBEngineVersionsAsync method.
    9. Displays and selects from a list of micro instance classes available for
the selected engine and version.
    10. Creates an RDS DB instance that contains a MySql database and uses the
parameter group
        using the CreateDBInstanceAsync method.
    11. Waits for DB instance to be ready using the DescribeDBInstancesAsync
method.
    12. Prints out the connection endpoint string for the new DB instance.
    13. Creates a snapshot of the DB instance using the CreateDBSnapshotAsync
method.
    14. Waits for DB snapshot to be ready using the DescribeDBSnapshots method.
    15. Deletes the DB instance using the DeleteDBInstanceAsync method.
    16. Waits for DB instance to be deleted using the DescribeDbInstances method.
    17. Deletes the parameter group using the DeleteDBParameterGroupAsync.

Java

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Run multiple operations.

```
/**  
 * Before running this Java (v2) code example, set up your development environment,  
 * including your credentials.  
 *  
 * For more information, see the following documentation topic:  
 *  
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html  
 *  
 * This Java example performs the following tasks:  
 *  
 * 1. Returns a list of the available DB engines.  
 * 2. Selects an engine family and create a custom DB parameter group.  
 * 3. Gets the parameter groups.  
 * 4. Gets parameters in the group.  
 * 5. Modifies the auto_increment_offset parameter.  
 * 6. Gets and displays the updated parameters.  
 * 7. Gets a list of allowed engine versions.  
 * 8. Gets a list of micro instance classes available for the selected engine.  
 * 9. Creates an RDS database instance that contains a MySql database and uses the  
 *    parameter group.  
 * 10. Waits for the DB instance to be ready and prints out the connection endpoint  
 *     value.  
 * 11. Creates a snapshot of the DB instance.  
 * 12. Waits for an RDS DB snapshot to be ready.  
 * 13. Deletes the RDS DB instance.  
 * 14. Deletes the parameter group.  
 */

Kotlin

## SDK for Kotlin

### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/**  
 * Before running this Java V2 code example, set up your development environment,  
 * including your credentials.  
  
 * For more information, see the following documentation topic:  
  
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html  
  
 * This example performs the following tasks:  
  
 * 1. Returns a list of the available DB engines by invoking the  
 *    DescribeDbEngineVersions method.  
 * 2. Selects an engine family and create a custom DB parameter group by invoking the  
 *    createDBParameterGroup method.  
 * 3. Gets the parameter groups by invoking the DescribeDbParameterGroups method.  
 * 4. Gets parameters in the group by invoking the DescribeDbParameters method.  
 * 5. Modifies both the auto_increment_offset and auto_increment_increment parameters  
 *    by invoking the modifyDbParameterGroup method.  
 * 6. Gets and displays the updated parameters.  
 * 7. Gets a list of allowed engine versions by invoking the describeDbEngineVersions  
 *    method.  
 * 8. Gets a list of micro instance classes available for the selected engine.  
 * 9. Creates an RDS database instance that contains a MySQL database and uses the  
 *    parameter group  
 * 10. Waits for DB instance to be ready and print out the connection endpoint value.  
 * 11. Creates a snapshot of the DB instance.  
 * 12. Waits for DB snapshot to be ready.  
 * 13. Deletes the DB instance. rds.DeleteDbInstance.  
 * 14. Deletes the parameter group.  
 */

## Cross-service examples for Amazon RDS using AWS SDKs

The following code examples show how to use Amazon Relational Database Service with AWS SDKs. Each example contains a sample application that works across multiple AWS services.

### Examples

- [Create a lending library REST API \(p. 1501\)](#)
- [Create an Aurora Serverless work item tracker \(p. 1502\)](#)

### Create a lending library REST API

The following code example shows how to create a lending library where patrons can borrow and return books by using a REST API backed by an Amazon Aurora database.

#### Python

##### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) with the Amazon Relational Database Service (Amazon RDS) API and AWS Chalice to create a REST API backed by an Amazon Aurora database. The web service is fully serverless and represents a simple lending library where patrons can borrow and return books. Learn how to:

- Create and manage a serverless Aurora database cluster.
- Use AWS Secrets Manager to manage database credentials.
- Implement a data storage layer that uses Amazon RDS to move data into and out of the database.
- Use AWS Chalice to deploy a serverless REST API to Amazon API Gateway and AWS Lambda.
- Use the Requests package to send requests to the web service.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- API Gateway
- Lambda
- Amazon RDS
- Secrets Manager

## Create an Aurora Serverless work item tracker

The following code examples show how to create a web application that tracks work items in an Amazon Aurora Serverless database and uses Amazon Simple Email Service (Amazon SES) to send reports.

.NET

### AWS SDK for .NET

Shows how to use the AWS SDK for .NET to create a web application that tracks work items in an Amazon Aurora database and emails reports by using Amazon Simple Email Service (Amazon SES). This example uses a front end built with React.js to interact with a RESTful .NET backend.

- Integrate a React web application with AWS services.
- List, add, update, and delete items in an Aurora table.
- Send an email report of filtered work items using Amazon SES.
- Deploy and manage example resources with the included AWS CloudFormation script.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

C++

### SDK for C++

Shows how to create a web application that tracks and reports on work items stored in an Amazon Aurora Serverless database.

For complete source code and instructions on how to set up a C++ REST API that queries Amazon Aurora Serverless data and for use by a React application, see the full example on [GitHub](#).

### Services used in this example

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

## Java

### SDK for Java 2.x

Shows how to create a web application that tracks and reports on work items stored in an Amazon RDS database.

For complete source code and instructions on how to set up a Spring REST API that queries Amazon Aurora Serverless data and for use by a React application, see the full example on [GitHub](#).

For complete source code and instructions on how to set up and run an example that uses the JDBC API, see the full example on [GitHub](#).

#### Services used in this example

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

## JavaScript

### SDK for JavaScript V3

Shows how to use the AWS SDK for JavaScript (v3) to create a web application that tracks work items in an Amazon Aurora database and emails reports by using Amazon Simple Email Service (Amazon SES). This example uses a front end built with React.js to interact with an Express Node.js backend.

- Integrate a React.js web application with AWS services.
- List, add, and update items in an Aurora table.
- Send an email report of filtered work items by using Amazon SES.
- Deploy and manage example resources with the included AWS CloudFormation script.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

## Kotlin

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

Shows how to create a web application that tracks and reports on work items stored in an Amazon RDS database.

For complete source code and instructions on how to set up a Spring REST API that queries Amazon Aurora Serverless data and for use by a React application, see the full example on [GitHub](#).

### Services used in this example

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

PHP

#### SDK for PHP

Shows how to use the AWS SDK for PHP to create a web application that tracks work items in an Amazon RDS database and emails reports by using Amazon Simple Email Service (Amazon SES). This example uses a front end built with React.js to interact with a RESTful PHP backend.

- Integrate a React.js web application with AWS services.
- List, add, update, and delete items in an Amazon RDS table.
- Send an email report of filtered work items using Amazon SES.
- Deploy and manage example resources with the included AWS CloudFormation script.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

Python

#### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) to create a REST service that tracks work items in an Amazon Aurora Serverless database and emails reports by using Amazon Simple Email Service (Amazon SES). This example uses the Flask web framework to handle HTTP routing and integrates with a React webpage to present a fully functional web application.

- Build a Flask REST service that integrates with AWS services.
- Read, write, and update work items that are stored in an Aurora Serverless database.
- Create an AWS Secrets Manager secret that contains database credentials and use it to authenticate calls to the database.
- Use Amazon SES to send email reports of work items.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Aurora
- Amazon RDS
- Amazon RDS Data Service

- Amazon SES

## Code examples for Amazon RDS Data Service using AWS SDKs

The following code examples show how to use Amazon Relational Database Service Data Service with an AWS software development kit (SDK).

### Code examples

- [Actions for Amazon RDS Data Service using AWS SDKs \(p. 1505\)](#)
  - [Run an SQL statement using an AWS SDK \(p. 1505\)](#)
- [Cross-service examples for Amazon RDS Data Service using AWS SDKs \(p. 1506\)](#)
  - [Create an Aurora Serverless work item tracker \(p. 1506\)](#)

## Actions for Amazon RDS Data Service using AWS SDKs

The following code examples show how to use Amazon Relational Database Service Data Service with AWS SDKs. Each example calls an individual service function.

### Examples

- [Run an SQL statement using an AWS SDK \(p. 1505\)](#)

## Run an SQL statement using an AWS SDK

The following code example shows how to run an SQL statement.

Rust

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn query_cluster(
    client: &Client,
    cluster_arn: &str,
    query: &str,
    secret_arn: &str,
) -> Result<(), Error> {
    let st = client
        .execute_statement()
        .resource_arn(cluster_arn)
        .database("postgres") // Do not confuse this with db instance name
        .sql(query)
        .secret_arn(secret_arn);
```

```
    let result = st.send().await?;

    println!("{:?}", result);
    println!();

    Ok(())
}
```

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
const { RedshiftClient } = require("@aws-sdk/client-redshift");
// Set the AWS Region.
const REGION = "REGION";
//Set the Redshift Service Object
const redshiftClient = new RedshiftClient({ region: REGION });
export { redshiftClient };
```

Create the cluster.

```
// Import required AWS SDK clients and commands for Node.js
import { CreateClusterCommand } from "@aws-sdk/client-redshift";
```

```

import { redshiftClient } from "./libs/redshiftClient.js";

const params = {
    ClusterIdentifier: "CLUSTER_NAME", // Required
    NodeType: "NODE_TYPE", //Required
    MasterUsername: "MASTER_USER_NAME", // Required - must be lowercase
    MasterUserPassword: "MASTER_USER_PASSWORD", // Required - must contain at least
    one uppercase letter, and one number
    ClusterType: "CLUSTER_TYPE", // Required
    IAMRoleARN: "IAM_ROLE_ARN", // Optional - the ARN of an IAM role with permissions
    your cluster needs to access other AWS services on your behalf, such as Amazon S3.
    ClusterSubnetGroupName: "CLUSTER_SUBNET_GROUPNAME", //Optional - the name of a
    cluster subnet group to be associated with this cluster. Defaults to 'default' if
    not specified.
    DBName: "DATABASE_NAME", // Optional - defaults to 'dev' if not specified
    Port: "PORT_NUMBER", // Optional - defaults to '5439' if not specified
};

const run = async () => {
    try {
        const data = await redshiftClient.send(new CreateClusterCommand(params));
        console.log(
            "Cluster " + data.Cluster.ClusterIdentifier + " successfully created"
        );
        return data; // For unit tests.
    } catch (err) {
        console.log("Error", err);
    }
};
run();

```

## Code examples for Amazon Rekognition using AWS SDKs

The following code examples show how to use Amazon Rekognition with an AWS software development kit (SDK).

#### Code examples

- [Actions for Amazon Rekognition using AWS SDKs \(p. 1519\)](#)
  - Compare faces in an image against a reference image with Amazon Rekognition using an AWS SDK (p. 1519)
  - Create an Amazon Rekognition collection using an AWS SDK (p. 1524)
  - Delete an Amazon Rekognition collection using an AWS SDK (p. 1526)
  - Delete faces from an Amazon Rekognition collection using an AWS SDK (p. 1529)
  - Describe an Amazon Rekognition collection using an AWS SDK (p. 1532)
  - Detect faces in an image with Amazon Rekognition using an AWS SDK (p. 1535)
  - Detect labels in an image with Amazon Rekognition using an AWS SDK (p. 1541)
  - Detect moderation labels in an image with Amazon Rekognition using an AWS SDK (p. 1545)
  - Detect text in an image with Amazon Rekognition using an AWS SDK (p. 1548)
  - Get information about celebrities with Amazon Rekognition using an AWS SDK (p. 1551)
  - Index faces to an Amazon Rekognition collection using an AWS SDK (p. 1552)
  - List Amazon Rekognition collections using an AWS SDK (p. 1556)
  - List faces in an Amazon Rekognition collection using an AWS SDK (p. 1559)
  - Recognize celebrities in an image with Amazon Rekognition using an AWS SDK (p. 1562)

- Search for faces in an Amazon Rekognition collection using an AWS SDK (p. 1566)
- Search for faces in an Amazon Rekognition collection compared to a reference image using an AWS SDK (p. 1569)
- Scenarios for Amazon Rekognition using AWS SDKs (p. 1572)
  - Build an Amazon Rekognition collection and find faces in it using an AWS SDK (p. 1572)
  - Detect and display elements in images with Amazon Rekognition using an AWS SDK (p. 1579)
  - Detect information in videos using Amazon Rekognition and the AWS SDK (p. 1588)
- Cross-service examples for Amazon Rekognition using AWS SDKs (p. 1606)
  - Detect PPE in images with Amazon Rekognition using an AWS SDK (p. 1606)
  - Detect faces in an image using an AWS SDK (p. 1607)
  - Detect objects in images with Amazon Rekognition using an AWS SDK (p. 1607)
  - Detect people and objects in a video with Amazon Rekognition using an AWS SDK (p. 1610)
  - Save EXIF and other image information using an AWS SDK (p. 1611)

## Actions for Amazon Rekognition using AWS SDKs

The following code examples show how to use Amazon Rekognition with AWS SDKs. Each example calls an individual service function.

### Examples

- Compare faces in an image against a reference image with Amazon Rekognition using an AWS SDK (p. 1519)
- Create an Amazon Rekognition collection using an AWS SDK (p. 1524)
- Delete an Amazon Rekognition collection using an AWS SDK (p. 1526)
- Delete faces from an Amazon Rekognition collection using an AWS SDK (p. 1529)
- Describe an Amazon Rekognition collection using an AWS SDK (p. 1532)
- Detect faces in an image with Amazon Rekognition using an AWS SDK (p. 1535)
- Detect labels in an image with Amazon Rekognition using an AWS SDK (p. 1541)
- Detect moderation labels in an image with Amazon Rekognition using an AWS SDK (p. 1545)
- Detect text in an image with Amazon Rekognition using an AWS SDK (p. 1548)
- Get information about celebrities with Amazon Rekognition using an AWS SDK (p. 1551)
- Index faces to an Amazon Rekognition collection using an AWS SDK (p. 1552)
- List Amazon Rekognition collections using an AWS SDK (p. 1556)
- List faces in an Amazon Rekognition collection using an AWS SDK (p. 1559)
- Recognize celebrities in an image with Amazon Rekognition using an AWS SDK (p. 1562)
- Search for faces in an Amazon Rekognition collection using an AWS SDK (p. 1566)
- Search for faces in an Amazon Rekognition collection compared to a reference image using an AWS SDK (p. 1569)

## Compare faces in an image against a reference image with Amazon Rekognition using an AWS SDK

The following code examples show how to compare faces in an image against a reference image with Amazon Rekognition.

## Scenarios for Amazon Rekognition using AWS SDKs

The following code examples show how to use Amazon Rekognition with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Build an Amazon Rekognition collection and find faces in it using an AWS SDK \(p. 1572\)](#)
- [Detect and display elements in images with Amazon Rekognition using an AWS SDK \(p. 1579\)](#)
- [Detect information in videos using Amazon Rekognition and the AWS SDK \(p. 1588\)](#)

### Build an Amazon Rekognition collection and find faces in it using an AWS SDK

The following code example shows how to:

- Create an Amazon Rekognition collection.
- Add images to the collection and detect faces in it.
- Search the collection for faces that match a reference image.
- Delete a collection.

For more information, see [Searching faces in a collection](#).

## Detect and display elements in images with Amazon Rekognition using an AWS SDK

The following code example shows how to:

- Detect elements in images by using Amazon Rekognition.
- Display images and draw bounding boxes around detected elements.

For more information, see [Displaying bounding boxes](#).

Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create classes to wrap Amazon Rekognition functions.

```
import logging
from pprint import pprint
import boto3
from botocore.exceptions import ClientError
import requests

from rekognition_objects import (
    RekognitionFace, RekognitionCelebrity, RekognitionLabel,

## Detect information in videos using Amazon Rekognition and the AWS SDK

The following code examples show how to:

- Start Amazon Rekognition jobs to detect elements like people, objects, and text in videos.
- Check job status until jobs finish.
- Output the list of elements detected by each job.

Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Get celebrity results from a video located in an Amazon S3 bucket.

```
public static void StartCelebrityDetection(RekognitionClient rekClient,  
                                         NotificationChannel channel,

## Cross-service examples for Amazon Rekognition using AWS SDKs

The following code examples show how to use Amazon Rekognition with AWS SDKs. Each example contains a sample application that works across multiple AWS services.

### Examples

- [Detect PPE in images with Amazon Rekognition using an AWS SDK \(p. 1606\)](#)
- [Detect faces in an image using an AWS SDK \(p. 1607\)](#)
- [Detect objects in images with Amazon Rekognition using an AWS SDK \(p. 1607\)](#)
- [Detect people and objects in a video with Amazon Rekognition using an AWS SDK \(p. 1610\)](#)
- [Save EXIF and other image information using an AWS SDK \(p. 1611\)](#)

## Detect PPE in images with Amazon Rekognition using an AWS SDK

The following code examples show how to build an app that uses Amazon Rekognition to detect Personal Protective Equipment (PPE) in images.

Java

### SDK for Java 2.x

Shows how to create an AWS Lambda function that detects images with Personal Protective Equipment.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- DynamoDB
- Amazon Rekognition
- Amazon S3
- Amazon SES

JavaScript

### SDK for JavaScript V3

Shows how to use Amazon Rekognition with the AWS SDK for JavaScript to create an application to detect personal protective equipment (PPE) in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app saves the results to an Amazon DynamoDB table, and sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

Learn how to:

- Create an unauthenticated user using Amazon Cognito.
- Analyze images for PPE using Amazon Rekognition.
- Verify an email address for Amazon SES.
- Update a DynamoDB table with results.
- Send an email notification using Amazon SES.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- DynamoDB
- Amazon Rekognition
- Amazon S3
- Amazon SES

## Detect faces in an image using an AWS SDK

The following code example shows how to:

- Save an image in an Amazon Simple Storage Service (Amazon S3) bucket.
- Use Amazon Rekognition (Amazon Rekognition) to detect facial details, such as age range, gender, and emotion (smiling, etc.).
- Display those details.

Rust

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

Save the image in an Amazon Simple Storage Service bucket with an **uploads** prefix, use Amazon Rekognition to detect facial details, such as age range, gender, and emotion (smiling, etc.), and display those details.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Rekognition
- Amazon S3

## Detect objects in images with Amazon Rekognition using an AWS SDK

The following code examples show how to build an app that uses Amazon Rekognition to detect objects by category in images.

.NET

**AWS SDK for .NET**

Shows how to use Amazon Rekognition .NET API to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

**Services used in this example**

- Amazon Rekognition
- Amazon S3
- Amazon SES

Java

**SDK for Java 2.x**

Shows how to use Amazon Rekognition Java API to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

**Services used in this example**

- Amazon Rekognition
- Amazon S3
- Amazon SES

JavaScript

**SDK for JavaScript V3**

Shows how to use Amazon Rekognition with the AWS SDK for JavaScript to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

Learn how to:

- Create an unauthenticated user using Amazon Cognito.
- Analyze images for objects using Amazon Rekognition.
- Verify an email address for Amazon SES.
- Send an email notification using Amazon SES.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

**Services used in this example**

- Amazon Rekognition

- Amazon S3
- Amazon SES

Kotlin

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

Shows how to use Amazon Rekognition Kotlin API to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

Python

### SDK for Python (Boto3)

Shows you how to use the AWS SDK for Python (Boto3) to create a web application that lets you do the following:

- Upload photos to an Amazon Simple Storage Service (Amazon S3) bucket.
- Use Amazon Rekognition to analyze and label the photos.
- Use Amazon Simple Email Service (Amazon SES) to send email reports of image analysis.

This example contains two main components: a webpage written in JavaScript that is built with React, and a REST service written in Python that is built with Flask-RESTful.

You can use the React webpage to:

- Display a list of images that are stored in your S3 bucket.
- Upload images from your computer to your S3 bucket.
- Display images and labels that identify items that are detected in the image.
- Get a report of all images in your S3 bucket and send an email of the report.

The webpage calls the REST service. The service sends requests to AWS to perform the following actions:

- Get and filter the list of images in your S3 bucket.
- Upload photos to your S3 bucket.
- Use Amazon Rekognition to analyze individual photos and get a list of labels that identify items that are detected in the photo.
- Analyze all photos in your S3 bucket and use Amazon SES to email a report.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

## Detect people and objects in a video with Amazon Rekognition using an AWS SDK

The following code examples show how to detect people and objects in a video with Amazon Rekognition.

Java

### SDK for Java 2.x

Shows how to use Amazon Rekognition Java API to create an app to detect faces and objects in videos located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

JavaScript

### SDK for JavaScript V3

Shows how to use Amazon Rekognition with the AWS SDK for JavaScript to create an app to detect faces and objects in videos located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

Learn how to:

- Create an unauthenticated user using Amazon Cognito.
- Analyze images for PPE using Amazon Rekognition.
- Verify an email address for Amazon SES.
- Send an email notification using Amazon SES.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Rekognition

- Amazon S3
- Amazon SES

Python

#### **SDK for Python (Boto3)**

Use Amazon Rekognition to detect faces, objects, and people in videos by starting asynchronous detection jobs. This example also configures Amazon Rekognition to notify an Amazon Simple Notification Service (Amazon SNS) topic when jobs complete and subscribes an Amazon Simple Queue Service (Amazon SQS) queue to the topic. When the queue receives a message about a job, the job is retrieved and the results are output.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### **Services used in this example**

- Amazon Rekognition
- Amazon SNS
- Amazon SQS

## **Save EXIF and other image information using an AWS SDK**

The following code example shows how to:

- Get EXIF information from a a JPG, JPEG, or PNG file.
- Upload the image file to an Amazon Simple Storage Service (Amazon S3) bucket.
- Use Amazon Rekognition (Amazon Rekognition) to identify the three top attributes (labels in Amazon Rekognition) in the file.
- Add the EXIF and label information to a Amazon DynamoDB (DynamoDB) table in the Region.

Rust

#### **SDK for Rust**

##### **Note**

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

Get EXIF information from a JPG, JPEG, or PNG file, upload the image file to an Amazon Simple Storage Service bucket, use Amazon Rekognition to identify the three top attributes (*labels* in Amazon Rekognition) in the file, and add the EXIF and label information to a Amazon DynamoDB table in the Region.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### **Services used in this example**

- DynamoDB
- Amazon Rekognition
- Amazon S3

# Code examples for Route 53 using AWS SDKs

The following code examples show how to use Amazon Route 53 with an AWS software development kit (SDK).

## Code examples

## Actions for Route 53 using AWS SDKs

The following code examples show how to use Amazon Route 53 with AWS SDKs. Each example calls an individual service function.

### Examples

- [Get a list of the public and private Route 53 hosted zones using an AWS SDK \(p. 1612\)](#)

## Get a list of the public and private Route 53 hosted zones using an AWS SDK

The following code example shows how to get a list of the public and private hosted zones.

Rust

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn show_host_info(client: &aws_sdk_route53::Client) -> Result<(),  
aws_sdk_route53::Error> {  
    let hosted_zone_count = client.get_hosted_zone_count().send().await?;  
  
    println!(  
        "Number of hosted zones in region : {}",  
        hosted_zone_count.hosted_zone_count().unwrap_or_default(),  
    );  
  
    let hosted_zones = client.list_hosted_zones().send().await?;  
  
    println!("Zones:");  
  
    for hz in hosted_zones.hosted_zones().unwrap_or_default() {  
        let zone_name = hz.name().unwrap_or_default();  
        let zone_id = hz.id().unwrap_or_default();  
  
        println!(" ID : {}", zone_id);  
        println!(" Name : {}", zone_name);  
        println!();  
    }  
}
```

```
    Ok(())  
}
```

- For API details, see [ListHostedZones](#) in *AWS SDK for Rust API reference*.

## Code examples for Route 53 domain registration using AWS SDKs

The following code examples show how to use Amazon Route 53 domain registration with an AWS software development kit (SDK).

### Get started

#### Hello Route 53 domain registration

The following code example shows how to get started using Amazon Route 53 domain registration.

.NET

##### AWS SDK for .NET

###### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static class HelloRoute53Domains  
{  
    static async Task Main(string[] args)  
    {  
        // Use the AWS .NET Core Setup package to set up dependency injection for  
        // the Amazon Route 53 domain registration service.  
        // Use your AWS profile name, or leave it blank to use the default profile.  
        using var host = Host.CreateDefaultBuilder(args)  
            .ConfigureServices(_ =>  
                services.AddAWSService<IAmazonRoute53Domains>()  
            ).Build();  
  
        // Now the client is available for injection.  
        var route53Client =  
            host.Services.GetRequiredService<IAmazonRoute53Domains>();  
  
        // You can use await and any of the async methods to get a response.  
        var response = await route53Client.ListPricesAsync(new ListPricesRequest  
        { Tld = "com" });  
        Console.WriteLine($"Hello Amazon Route 53 Domains! Following are prices  
        for .com domain operations:");  
        var comPrices = response.Prices.FirstOrDefault();  
        if (comPrices != null)  
        {  
            Console.WriteLine($"\\tRegistration:  
            {comPrices.RegistrationPrice?.Price} {comPrices.RegistrationPrice?.Currency}");  
            Console.WriteLine($"\\tRenewal: {comPrices.RenewalPrice?.Price}  
            {comPrices.RenewalPrice?.Currency}");  
        }  
    }  
}
```

- For API details, see [ListPrices](#) in *AWS SDK for .NET API Reference*.

## Scenarios for Route 53 domain registration using AWS SDKs

The following code examples show how to use Amazon Route 53 domain registration with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Get started with Route 53 domain registration using an AWS SDK \(p. 1622\)](#)

## Get started with Route 53 domain registration using an AWS SDK

The following code example shows how to:

- List current domains.
- List operations in the past year.
- View billing for the account in the past year.
- View prices for domain types.
- Get domain suggestions.
- Check domain availability.
- Check domain transferability.
- Optionally, request a domain registration.
- Get an operation detail.
- Optionally, get a domain detail.

.NET

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Run an interactive scenario at a command prompt.

```
public static class Route53DomainScenario
{
    /*
        Before running this .NET code example, set up your development environment,
        including your credentials.

    This .NET example performs the following tasks:
    1. List current domains.
    2. List operations in the past year.
    3. View billing for the account in the past year.
    4. View prices for domain types.
    5. Get domain suggestions.
    6. Check domain availability.
    7. Check domain transferability.
    8. Optionally, request a domain registration.
    9. Get an operation detail.
    10. Optionally, get a domain detail.

## Code examples for Amazon S3 using AWS SDKs

The following code examples show how to use Amazon Simple Storage Service with an AWS software development kit (SDK).

### Get started

#### Hello Amazon S3

The following code example shows how to get started using Amazon Simple Storage Service (Amazon S3).

##### Python

###### [SDK for Python \(Boto3\)](#)

###### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
import boto3

def hello_s3():
    """
    Use the AWS SDK for Python (Boto3) to create an Amazon Simple Storage Service
    (Amazon S3) resource and list the buckets in your account.
    This example uses the default settings specified in your shared credentials
    and config files.
    """
    s3_resource = boto3.resource('s3')
    print("Hello, Amazon S3! Let's list your buckets:")
    for bucket in s3_resource.buckets.all():
        print(f"\t{bucket.name}")

if __name__ == '__main__':
    hello_s3()
```

- For API details, see [ListBuckets in AWS SDK for Python \(Boto3\) API Reference](#).

### Code examples

- [Actions for Amazon S3 using AWS SDKs \(p. 1634\)](#)
  - Add CORS rules to an Amazon S3 bucket using an AWS SDK (p. 1634)
  - Add a lifecycle configuration to an Amazon S3 bucket using an AWS SDK (p. 1639)
  - Add a policy to an Amazon S3 bucket using an AWS SDK (p. 1642)
  - Complete a multipart upload action using an AWS SDK (p. 1647)
  - Copy an object from one Amazon S3 bucket to another using an AWS SDK (p. 1647)
  - Create an Amazon S3 bucket using an AWS SDK (p. 1656)
  - Create a multipart upload structure using an AWS SDK (p. 1664)
  - Delete CORS rules from an Amazon S3 bucket using an AWS SDK (p. 1665)
  - Delete a policy from an Amazon S3 bucket using an AWS SDK (p. 1666)

- Delete an empty Amazon S3 bucket using an AWS SDK (p. 1670)
  - Delete an Amazon S3 object using an AWS SDK (p. 1675)
  - Delete multiple objects from an Amazon S3 bucket using an AWS SDK (p. 1681)
  - Delete the lifecycle configuration of an Amazon S3 bucket using an AWS SDK (p. 1689)
  - Delete the website configuration from an Amazon S3 bucket using an AWS SDK (p. 1690)
  - Determine the existence and content type of an object in an Amazon S3 bucket using an AWS SDK (p. 1692)
  - Determine the existence of an Amazon S3 bucket using an AWS SDK (p. 1693)
  - Get CORS rules for an Amazon S3 bucket using an AWS SDK (p. 1694)
  - Get an object from an Amazon S3 bucket using an AWS SDK (p. 1696)
  - Get the ACL of an Amazon S3 bucket using an AWS SDK (p. 1706)
  - Get the ACL of an Amazon S3 object using an AWS SDK (p. 1709)
  - Get the Region where the Amazon S3 bucket resides using an AWS SDK (p. 1714)
  - Get the lifecycle configuration of an Amazon S3 bucket using an AWS SDK (p. 1715)
  - Get the policy for an Amazon S3 bucket using an AWS SDK (p. 1716)
  - Get the website configuration for an Amazon S3 bucket using an AWS SDK (p. 1719)
  - List Amazon S3 buckets using an AWS SDK (p. 1721)
  - List in-progress multipart uploads to an Amazon S3 bucket using an AWS SDK (p. 1725)
  - List the version of objects in an Amazon S3 bucket using an AWS SDK (p. 1725)
  - List objects in an Amazon S3 bucket using an AWS SDK (p. 1726)
  - Restore an archived copy of an object back into an Amazon S3 bucket using an AWS SDK (p. 1734)
  - Set a new ACL for an Amazon S3 bucket using an AWS SDK (p. 1735)
  - Set the ACL of an Amazon S3 object using an AWS SDK (p. 1738)
  - Set the website configuration for an Amazon S3 bucket using an AWS SDK (p. 1739)
  - Upload a single part of a multipart upload using an AWS SDK (p. 1743)
  - Upload an object to an Amazon S3 bucket using an AWS SDK (p. 1743)
- Scenarios for Amazon S3 using AWS SDKs (p. 1757)
    - Create a presigned URL for Amazon S3 using an AWS SDK (p. 1757)
    - Get started with Amazon S3 buckets and objects using an AWS SDK (p. 1765)
    - Manage versioned Amazon S3 objects in batches with a Lambda function using an AWS SDK (p. 1802)
    - Upload or download large files to and from Amazon S3 using an AWS SDK (p. 1803)
    - Work with Amazon S3 versioned objects using an AWS SDK (p. 1820)
  - Cross-service examples for Amazon S3 using AWS SDKs (p. 1824)
    - Build an Amazon Transcribe app (p. 1824)
    - Convert text to speech and back to text using an AWS SDK (p. 1825)
    - Create a long-lived Amazon EMR cluster and run several steps using an AWS SDK (p. 1825)
    - Create a short-lived Amazon EMR cluster and run a step using an AWS SDK (p. 1826)
    - Create an Amazon Textract explorer application (p. 1826)
    - Detect PPE in images with Amazon Rekognition using an AWS SDK (p. 1827)
    - Detect entities in text extracted from an image using an AWS SDK (p. 1828)
    - Detect faces in an image using an AWS SDK (p. 1829)
  - Detect objects in images with ~~Amazon~~ Rekognition using an AWS SDK (p. 1829)
  - Detect people and objects in a video with Amazon Rekognition using an AWS SDK (p. 1832)
  - Save EXIF and other image information using an AWS SDK (p. 1832)

## Actions for Amazon S3 using AWS SDKs

The following code examples show how to use Amazon Simple Storage Service with AWS SDKs. Each example calls an individual service function.

### Examples

- [Add CORS rules to an Amazon S3 bucket using an AWS SDK \(p. 1634\)](#)
- [Add a lifecycle configuration to an Amazon S3 bucket using an AWS SDK \(p. 1639\)](#)
- [Add a policy to an Amazon S3 bucket using an AWS SDK \(p. 1642\)](#)
- [Complete a multipart upload action using an AWS SDK \(p. 1647\)](#)
- [Copy an object from one Amazon S3 bucket to another using an AWS SDK \(p. 1647\)](#)
- [Create an Amazon S3 bucket using an AWS SDK \(p. 1656\)](#)
- [Create a multipart upload structure using an AWS SDK \(p. 1664\)](#)
- [Delete CORS rules from an Amazon S3 bucket using an AWS SDK \(p. 1665\)](#)
- [Delete a policy from an Amazon S3 bucket using an AWS SDK \(p. 1666\)](#)
- [Delete an empty Amazon S3 bucket using an AWS SDK \(p. 1670\)](#)
- [Delete an Amazon S3 object using an AWS SDK \(p. 1675\)](#)
- [Delete multiple objects from an Amazon S3 bucket using an AWS SDK \(p. 1681\)](#)
- [Delete the lifecycle configuration of an Amazon S3 bucket using an AWS SDK \(p. 1689\)](#)
- [Delete the website configuration from an Amazon S3 bucket using an AWS SDK \(p. 1690\)](#)
- [Determine the existence and content type of an object in an Amazon S3 bucket using an AWS SDK \(p. 1692\)](#)
- [Determine the existence of an Amazon S3 bucket using an AWS SDK \(p. 1693\)](#)
- [Get CORS rules for an Amazon S3 bucket using an AWS SDK \(p. 1694\)](#)
- [Get an object from an Amazon S3 bucket using an AWS SDK \(p. 1696\)](#)

### Add CORS rules to an Amazon S3 bucket using an AWS SDK

The following code examples show how to add cross-origin resource sharing (CORS) rules to an S3 bucket.

Java

## SDK for Java 2.x

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void deleteBucketCorsInformation(S3Client s3, String bucketName,
String accountId) {
    try {
        DeleteBucketCorsRequest bucketCorsRequest =
DeleteBucketCorsRequest.builder()
    .bucket(bucketName)
    .expectedBucketOwner(accountId)
    .build();

        s3.deleteBucketCors(bucketCorsRequest) ;

    } catch (S3Exception e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}

public static void getBucketCorsInformation(S3Client s3, String bucketName,
String accountId) {

    try {
        GetBucketCorsRequest bucketCorsRequest = GetBucketCorsRequest.builder()
    .bucket(bucketName)
    .expectedBucketOwner(accountId)
    .build();

        GetBucketCorsResponse corsResponse =
s3.getBucketCors(bucketCorsRequest);
        List<CORSRule> corsRules = corsResponse.corsRules();
        for (CORSRule rule: corsRules) {
            System.out.println("allowOrigins: "+rule.allowedOrigins());
            System.out.println("AllowedMethod: "+rule.allowedMethods());
        }
    } catch (S3Exception e) {

        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}

public static void setCorsInformation(S3Client s3, String bucketName, String
accountId) {

    List<String> allowMethods = new ArrayList<>();
    allowMethods.add("PUT");
    allowMethods.add("POST");
    allowMethods.add("DELETE");

    List<String> allowOrigins = new ArrayList<>();
    allowOrigins.add("http://example.com");
    try {
        // Define CORS rules.
        CORSRule corsRule = CORSRule.builder()
    .allowedMethods(allowMethods)
    .allowedOrigins(allowOrigins)
```

```
.build();

List<CORSRule> corsRules = new ArrayList<>();
corsRules.add(corsRule);
CORSConfiguration configuration = CORSConfiguration.builder()
    .corsRules(corsRules)
    .build();

PutBucketCorsRequest putBucketCorsRequest =
PutBucketCorsRequest.builder()
    .bucket(bucketName)
    .corsConfiguration(configuration)
    .expectedBucketOwner(accountId)
    .build();

s3.putBucketCors(putBucketCorsRequest);

} catch (S3Exception e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}
}
```

## JavaScript

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.
import { S3Client } from "@aws-sdk/client-s3";
// Set the AWS Region.
const REGION = "us-east-1";
// Create an Amazon S3 service client object.
const s3Client = new S3Client({ region: REGION });
export { s3Client };
```

Add a CORS rule.

```
// Import required AWS-SDK clients and commands for Node.js.
import { PutBucketCorsCommand } from "@aws-sdk/client-s3";
import { s3Client } from "./libs/s3Client.js"; // Helper function that creates an
Amazon S3 service client module.

// Set parameters.
// Create initial parameters JSON for putBucketCors.
const thisConfig = {
    AllowedHeaders: ["Authorization"],
    AllowedMethods: [],
    AllowedOrigins: ["*"],
    ExposeHeaders: [],
    MaxAgeSeconds: 3000,
};

// Assemble the list of allowed methods based on command line parameters
```

```
const allowedMethods = [];
process.argv.forEach(function (val) {
  if (val.toUpperCase() === "POST") {
    allowedMethods.push("POST");
  }
  if (val.toUpperCase() === "GET") {
    allowedMethods.push("GET");
  }
  if (val.toUpperCase() === "PUT") {
    allowedMethods.push("PUT");
  }
  if (val.toUpperCase() === "PATCH") {
    allowedMethods.push("PATCH");
  }
  if (val.toUpperCase() === "DELETE") {
    allowedMethods.push("DELETE");
  }
  if (val.toUpperCase() === "HEAD") {
    allowedMethods.push("HEAD");
  }
});
// Copy the array of allowed methods into the config object
thisConfig.AllowMethods = allowedMethods;

// Create an array of configs then add the config object to it.
const corsRules = new Array(thisConfig);

// Create CORS parameters.
export const corsParams = {
  Bucket: "BUCKET_NAME",
  CORSConfiguration: { CORSRules: corsRules },
};
export async function run() {
  try {
    const data = await s3Client.send(new PutBucketCorsCommand(corsParams));
    console.log("Success", data);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
}
run();
```

Create the client.

```
// Create service client module using ES6 syntax.
import { S3Client } from "@aws-sdk/client-s3";
// Set the AWS Region.
const REGION = "us-east-1";
```

```
// Create an Amazon S3 service client object.  
const s3Client = new S3Client({ region: REGION });  
export { s3Client };
```

Add the policy.

```
// Import required AWS SDK clients and commands for Node.js.  
import { CreateBucketCommand, PutBucketPolicyCommand } from "@aws-sdk/client-s3";  
import { s3Client } from "./libs/s3Client.js"; // Helper function that creates an  
Amazon S3 service client module.  
  
const BUCKET_NAME = "BUCKET_NAME";  
export const bucketParams = {  
    Bucket: BUCKET_NAME,  
};  
// Create the policy in JSON for the S3 bucket.  
const readOnlyAnonUserPolicy = {  
    Version: "2012-10-17",  
    Statement: [  
        {  
            Sid: "AddPerm",  
            Effect: "Allow",  
            Principal: "*",  
            Action: ["s3:GetObject"],  
            Resource: ["*"],  
        },  
    ],  
};  
  
// Create selected bucket resource string for bucket policy.  
const bucketResource = "arn:aws:s3:::" + BUCKET_NAME + "*"; //BUCKET_NAME  
readOnlyAnonUserPolicy.Statement[0].Resource[0] = bucketResource;  
  
// Convert policy JSON into string and assign into parameters.  
const bucketPolicyParams = {  
    Bucket: BUCKET_NAME,  
    Policy: JSON.stringify(readOnlyAnonUserPolicy),  
};  
  
export const run = async () => {  
    try {  
        const data = await s3Client.send(  
            new CreateBucketCommand(bucketParams)  
        );  
        console.log('Success, bucket created.', data)  
        try {  
            const response = await s3Client.send(  
                new PutBucketPolicyCommand(bucketPolicyParams)  
            );  
            console.log("Success, permissions added to bucket", response);  
            return response;  
        }  
        catch (err) {  
            console.log("Error adding policy to S3 bucket.", err);  
        }  
    } catch (err) {  
        console.log("Error creating S3 bucket.", err);  
    }  
};  
run();
```

## Delete multiple objects from an Amazon S3 bucket using an AWS SDK

The following code examples show how to delete multiple objects from an S3 bucket.

.NET

**AWS SDK for .NET**

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Delete all objects in an S3 bucket.

```
/// <summary>
/// Delete all of the objects stored in an existing Amazon S3 bucket.
/// </summary>
/// <param name="client">An initialized Amazon S3 client object.</param>
/// <param name="bucketName">The name of the bucket from which the
/// contents will be deleted.</param>
/// <returns>A boolean value that represents the success or failure of
/// deleting all of the objects in the bucket.</returns>
public static async Task<bool> DeleteBucketContentsAsync(IAmazonS3 client,
string bucketName)
{
    // Iterate over the contents of the bucket and delete all objects.
    var request = new ListObjectsV2Request
    {
        BucketName = bucketName,
    };

    try
    {
        var response = await client.ListObjectsV2Async(request);

        do
        {
            response.S3Objects
                .ForEach(async obj => await
client.DeleteObjectAsync(bucketName, obj.Key));

            // If the response is truncated, set the request
ContinuationToken
                // from the NextContinuationToken property of the response.
                request.ContinuationToken = response.NextContinuationToken;
        }
        while (response.IsTruncated);

        return true;
    }
    catch (AmazonS3Exception ex)
    {
        Console.WriteLine($"Error deleting objects: {ex.Message}");
        return false;
    }
}
```

- For API details, see [DeleteObjects](#) in *AWS SDK for .NET API Reference*.

## Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void deleteBucketObjects(S3Client s3, String bucketName) {

    // Upload three sample objects to the specified Amazon S3 bucket.
    ArrayList<ObjectIdentifier> keys = new ArrayList<>();
    PutObjectRequest putOb;
    ObjectIdentifier objectId;

    for (int i = 0; i < 3; i++) {
        String keyName = "delete object example " + i;
        objectId = ObjectIdentifier.builder()
            .key(keyName)
            .build();

        putOb = PutObjectRequest.builder()
            .bucket(bucketName)
            .key(keyName)
            .build();

        s3.putObject(putOb, RequestBody.fromString(keyName));
        keys.add(objectId);
    }

    System.out.println(keys.size() + " objects successfully created.");

    // Delete multiple objects in one request.
    Delete del = Delete.builder()
        .objects(keys)
        .build();

    try {
        DeleteObjectsRequest multiObjectDeleteRequest =
DeleteObjectsRequest.builder()
            .bucket(bucketName)
            .delete(del)
            .build();

        s3.deleteObjects(multiObjectDeleteRequest);
        System.out.println("Multiple objects are deleted!");
    } catch (S3Exception e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

## JavaScript

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.  
import { S3Client } from "@aws-sdk/client-s3";  
// Set the AWS Region.  
const REGION = "us-east-1";  
// Create an Amazon S3 service client object.  
const s3Client = new S3Client({ region: REGION });  
export { s3Client };
```

Delete multiple objects.

```
import { DeleteObjectsCommand } from "@aws-sdk/client-s3";  
import { s3Client } from "./libs/s3Client.js" // Helper function that creates an  
Amazon S3 service client module.  
  
export const bucketParams = {  
    Bucket: "BUCKET_NAME",  
    Delete: {  
        Objects: [  
            {  
                Key: "KEY_1",  
            },  
            {  
                Key: "KEY_2",  
            },  
        ],  
    },  
};  
  
export const run = async () => {  
    try {  
        const data = await s3Client.send(new DeleteObjectsCommand(bucketParams));  
        return data; // For unit tests.  
        console.log("Success. Object deleted.");  
    } catch (err) {  
        console.log("Error", err);  
    }  
};  
run();
```

Delete all objects in a bucket.

```
import { ListObjectsCommand, DeleteObjectCommand } from "@aws-sdk/client-s3";  
import { s3Client } from "./libs/s3Client.js"; // Helper function that creates an  
Amazon S3 service client module.  
  
export const bucketParams = { Bucket: "BUCKET_NAME" };  
  
export const run = async () => {  
    try {  
        const data = await s3Client.send(new ListObjectsCommand(bucketParams));  
        let noOfObjects = data.Contents;  
        for (let i = 0; i < noOfObjects.length; i++) {  
            await s3Client.send(  
                new DeleteObjectCommand({  
                    Bucket: bucketParams.Bucket,  
                    Key: noOfObjects[i].Key,  
                })  
            );  
        }  
    }  
};
```

```
        console.log("Success. Objects deleted.");
        return data; // For unit tests.
    } catch (err) {
        console.log("Error", err);
    }
};
```

## Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Read data as a byte array.

```
public static void getObjectType(S3Client s3, String bucketName, String
keyName, String path) {

    try {
        GetObjectRequest objectRequest = GetObjectRequest
            .builder()
            .key(keyName)
            .bucket(bucketName)
            .build();

        ResponseBytes<GetObjectResponse> objectBytes =
s3.getObjectAsBytes(objectRequest);
        byte[] data = objectBytes.asByteArray();

        // Write the data to a local file.
        File myFile = new File(path );
        OutputStream os = new FileOutputStream(myFile);
        os.write(data);
        System.out.println("Successfully obtained bytes from an S3 object");
        os.close();

    } catch (IOException ex) {
        ex.printStackTrace();
    } catch (S3Exception e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

Read tags that belong to an object.

```
public static void listTags(S3Client s3, String bucketName, String keyName) {
```

```
try {
    GetObjectTaggingRequest getTaggingRequest = GetObjectTaggingRequest
        .builder()
        .key(keyName)
        .bucket(bucketName)
        .build();

    GetObjectTaggingResponse tags = s3.getObjectTagging(getTaggingRequest);
    List<Tag> tagSet= tags.tagSet();
    for (Tag tag : tagSet) {
        System.out.println(tag.key());
        System.out.println(tag.value());
    }
}

} catch (S3Exception e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}
}
```

Get a URL for an object.

```
public static void getUrl(S3Client s3, String bucketName, String keyName ) {

    try {
        GetUrlRequest request = GetUrlRequest.builder()
            .bucket(bucketName)
            .key(keyName)
            .build();

        URL url = s3.utilities().getUrl(request);
        System.out.println("The URL for " +keyName + " is " + url);

    } catch (S3Exception e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

Get an object by using the S3Presigner client object.

```
public static void getPresignedUrl(S3Presigner presigner, String bucketName,
String keyName ) {

    try {
        GetObjectRequest getObjectRequest = GetObjectRequest.builder()
            .bucket(bucketName)
            .key(keyName)
            .build();

        GetObjectPresignRequest getObjectPresignRequest =
GetObjectPresignRequest.builder()
            .signatureDuration(Duration.ofMinutes(60))
            .getObjectRequest(getObjectRequest)
            .build();

        PresignedGetObjectRequest presignedGetObjectRequest =
presigner.presignGetObject(getObjectPresignRequest);
        String theUrl = presignedGetObjectRequest.url().toString();
        System.out.println("Presigned URL: " + theUrl);
    }
}
```

```
HttpURLConnection connection = (HttpURLConnection)
presignedGetObjectRequest.url().openConnection();
presignedGetObjectRequest.httpRequest().headers().forEach((header,
values) -> {
    values.forEach(value -> {
        connection.addRequestProperty(header, value);
    });
});

// Send any request payload that the service needs (not needed when
isBrowserExecutable is true).
if (presignedGetObjectRequest.signedPayload().isPresent()) {
    connection.setDoOutput(true);

    try (InputStream signedPayload =
presignedGetObjectRequest.signedPayload().get().asInputStream();
        OutputStream httpOutputStream = connection.getOutputStream()) {
        IoUtils.copy(signedPayload, httpOutputStream);
    }
}

// Download the result of executing the request.
try (InputStream content = connection.getInputStream()) {
    System.out.println("Service returned response: ");
    IoUtils.copy(content, System.out);
}

} catch (S3Exception | IOException e) {
    e.printStackTrace();
}
}
```

## JavaScript

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.  
import { S3Client } from "@aws-sdk/client-s3";  
// Set the AWS Region.  
const REGION = "us-east-1";  
// Create an Amazon S3 service client object.  
const s3Client = new S3Client({ region: REGION });  
export { s3Client };
```

Create and upload the object.

```
// Import required AWS SDK clients and commands for Node.js.  
import { PutObjectCommand } from "@aws-sdk/client-s3";  
import { s3Client } from "./libs/s3Client.js"; // Helper function that creates an  
Amazon S3 service client module.  
  
// Set the parameters.  
export const bucketParams = {  
    Bucket: "BUCKET_NAME",  
    // Specify the name of the new object. For example, 'index.html'.  
    // To create a directory for the object, use '/'. For example, 'myApp/  
    package.json'.  
    Key: "OBJECT_NAME",  
    // Content of the new object.  
    Body: "BODY",  
};  
  
// Create and upload the object to the S3 bucket.  
export const run = async () => {  
    try {  
        const data = await s3Client.send(new PutObjectCommand(bucketParams));  
        return data; // For unit tests.  
        console.log(  
            "Successfully uploaded object: " +  
            bucketParams.Bucket +  
            "/" +  
            bucketParams.Key  
        );  
    } catch (err) {  
        console.log("Error", err);  
    }  
};  
run();
```

Upload the object.

```
// Import required AWS SDK clients and commands for Node.js.
```

```
import { PutObjectCommand } from "@aws-sdk/client-s3";
import { s3Client } from "./libs/s3Client.js"; // Helper function that creates an
// Amazon S3 service client module.
import {path} from "path";
import {fs} from "fs";

const file = "OBJECT_PATH_AND_NAME"; // Path to and name of object. For example
'./myFiles/index.js'.
const fileStream = fs.createReadStream(file);

// Set the parameters
export const uploadParams = {
  Bucket: "BUCKET_NAME",
  // Add the required 'Key' parameter using the 'path' module.
  Key: path.basename(file),
  // Add the required 'Body' parameter
  Body: fileStream,
};

// Upload file to specified bucket.
export const run = async () => {
  try {
    const data = await s3Client.send(new PutObjectCommand(uploadParams));
    console.log("Success", data);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

## Ruby

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Upload a file using a managed uploader (`Object.upload_file`).

```
require "aws-sdk-s3"

# Wraps Amazon S3 object actions.
class ObjectUploadFileWrapper
  attr_reader :object

  # @param object [Aws::S3::Object] An existing Amazon S3 object.
  def initialize(object)
    @object = object
  end

  # Uploads a file to an Amazon S3 object by using a managed uploader.
  #
  # @param file_path [String] The path to the file to upload.
  # @return [Boolean] True when the file is uploaded; otherwise false.
  def upload_file(file_path)
    @object.upload_file(file_path)
    true
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't upload file #{file_path} to #{@object.key}. Here's why:
#{e.message}"
```

```

        false
    end
end

def run_demo
  bucket_name = "doc-example-bucket"
  object_key = "my-uploaded-file"
  file_path = "object_upload_file.rb"

  wrapper = ObjectUploadFileWrapper.new(Aws::S3::Object.new(bucket_name,
  object_key))
  return unless wrapper.upload_file(file_path)

  puts "File #{file_path} successfully uploaded to #{bucket_name}:#{object_key}."
end

run_demo if $PROGRAM_NAME == __FILE__

```

Upload a file using Object.put.

```

require "aws-sdk-s3"

# Wraps Amazon S3 object actions.
class ObjectPutWrapper
  attr_reader :object

  # @param object [Aws::S3::Object] An existing Amazon S3 object.
  def initialize(object)
    @object = object
  end

  def put_object(source_file_path)
    File.open(source_file_path, "rb") do |file|
      @object.put(body: file)
    end
    true
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't put #{source_file_path} to #{object.key}. Here's why:
  #{e.message}"
    false
  end
end

def run_demo
  bucket_name = "doc-example-bucket"
  object_key = "my-object-key"
  file_path = "my-local-file.txt"

  wrapper = ObjectPutWrapper.new(Aws::S3::Object.new(bucket_name, object_key))
  success = wrapper.put_object(file_path)
  return unless success

  puts "Put file #{file_path} into #{object_key} in #{bucket_name}."
end

run_demo if $PROGRAM_NAME == __FILE__

```

Upload a file using Object.put and add server-side encryption.

```

require "aws-sdk-s3"

```

```
# Wraps Amazon S3 object actions.
class ObjectPutSseWrapper
  attr_reader :object

  # @param object [Aws::S3::Object] An existing Amazon S3 object.
  def initialize(object)
    @object = object
  end

  def put_object_encrypted(object_content, encryption)
    @object.put(body: object_content, server_side_encryption: encryption)
    true
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't put your content to #{object.key}. Here's why: #{e.message}"
    false
  end
end

def run_demo
  bucket_name = "doc-example-bucket"
  object_key = "my-encrypted-content"
  object_content = "This is my super-secret content."
  encryption = "AES256"

  wrapper = ObjectPutSseWrapper.new(Aws::S3::Object.new(bucket_name,
  object_content))
  return unless wrapper.put_object_encrypted(object_content, encryption)

  puts "Put your content into #{bucket_name}:#{object_key} and encrypted it with
  #{encryption}."
end

run_demo if $PROGRAM_NAME == __FILE__
```

Upload a file from local storage to a bucket.

```
public func uploadFile(bucket: String, key: String, file: String) async throws
{
```

```
let fileUrl = URL(fileURLWithPath: file)
let fileData = try Data(contentsOf: fileUrl)
let dataStream = ByteStream.from(data: fileData)

let input = PutObjectInput(
    body: dataStream,
    bucket: bucket,
    key: key
)
_ = try await client.putObject(input: input)
}
```

Upload the contents of a Swift Data object to a bucket.

```
public func createFile(bucket: String, key: String, withData data: Data) async
throws {
    let dataStream = ByteStream.from(data: data)

    let input = PutObjectInput(
        body: dataStream,
        bucket: bucket,
        key: key
    )
    _ = try await client.putObject(input: input)
}
```

- For API details, see [PutObject](#) in *AWS SDK for Swift API reference*.

## Scenarios for Amazon S3 using AWS SDKs

The following code examples show how to use Amazon Simple Storage Service with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Create a presigned URL for Amazon S3 using an AWS SDK \(p. 1757\)](#)
- [Get started with Amazon S3 buckets and objects using an AWS SDK \(p. 1765\)](#)
- [Manage versioned Amazon S3 objects in batches with a Lambda function using an AWS SDK \(p. 1802\)](#)
- [Upload or download large files to and from Amazon S3 using an AWS SDK \(p. 1803\)](#)
- [Work with Amazon S3 versioned objects using an AWS SDK \(p. 1820\)](#)

## Create a presigned URL for Amazon S3 using an AWS SDK

The following code examples show how to create a presigned URL for S3 and upload an object.

Go

### SDK for Go V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Get a presigned URL for the object.  
// In order to get a presigned URL for an object, you must  
// create a Presignclient  
fmt.Println("Create Presign client")  
presignClient := s3.NewPresignClient(&client)  
  
presignParams := &s3.GetObjectInput{  
    Bucket: aws.String(name),  
    Key: aws.String("path/myfile.jpg"),  
}  
  
// Apply an expiration via an option function  
presignDuration := func(po *s3.PresignOptions) {  
    po.Expires = 5 * time.Minute  
}  
  
presignResult, err := presignClient.PresignGetObject(context.TODO(),  
    presignParams, presignDuration)  
  
if err != nil {  
    panic("Couldn't get presigned URL for GetObject")  
}  
  
fmt.Printf("Presigned URL For object: %s\n", presignResult.URL)
```

Java

## Get started with Amazon S3 buckets and objects using an AWS SDK

The following code examples show how to:

- Create a bucket.
- Upload a file to the bucket.
- Download an object from a bucket.
- Copy an object to a subfolder in a bucket.
- List the objects in a bucket.
- Delete the objects in a bucket.
- Delete a bucket.

## Manage versioned Amazon S3 objects in batches with a Lambda function using an AWS SDK

The following code example shows how to manage versioned S3 objects in batches with a Lambda function.

Python

### SDK for Python (Boto3)

Shows how to manipulate Amazon Simple Storage Service (Amazon S3) versioned objects in batches by creating jobs that call AWS Lambda functions to perform processing. This example creates a version-enabled bucket, uploads the stanzas from the poem *You Are Old, Father William* by Lewis Carroll, and uses Amazon S3 batch jobs to twist the poem in various ways.

#### Learn how to:

- Create Lambda functions that operate on versioned objects.
- Create a manifest of objects to update.
- Create batch jobs that invoke Lambda functions to update objects.
- Delete Lambda functions.
- Empty and delete a versioned bucket.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon S3

## Upload or download large files to and from Amazon S3 using an AWS SDK

The following code examples show how to upload or download large files to and from Amazon S3.

For more information, see [Uploading an object using multipart upload](#).

.NET

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Call functions that transfer files to and from an S3 bucket using the Amazon S3 TransferUtility.

```
global using System.Text;
global using Amazon;
global using Amazon.S3;
global using Amazon.S3.Model;
global using Amazon.S3.Transfer;
global using TransferUtilityBasics;

// This Amazon S3 client uses the default user credentials
// defined for this computer.
using Microsoft.Extensions.Configuration;

IAmazonS3 client = new AmazonS3Client();
var transferUtil = new TransferUtility(client);
IConfiguration _configuration;

_configuration = new ConfigurationBuilder()
    .SetBasePath(Directory.GetCurrentDirectory())
    .AddJsonFile("settings.json") // Load test settings from JSON file.
    .AddJsonFile("settings.local.json",
        true) // Optionally load local settings.

## Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create functions that transfer files using several of the available transfer manager settings. Use a callback class to write callback progress during file transfer.

```
import sys  
import threading  
  
import boto3  
from boto3.s3.transfer import TransferConfig  
  
MB = 1024 * 1024  
s3 = boto3.resource('s3')  
  
class TransferCallback:  
    """  
    Handle callbacks from the transfer manager.  
    """  
  
    The transfer manager periodically calls the __call__ method throughout  
    the upload and download process so that it can take action, such as
```

```
displaying progress to the user and collecting data about the transfer.  
"""  
  
def __init__(self, target_size):  
    self._target_size = target_size  
    self._total_transferred = 0  
    self._lock = threading.Lock()  
    self.thread_info = {}  
  
def __call__(self, bytes_transferred):  
    """  
        The callback method that is called by the transfer manager.  
  
        Display progress during file transfer and collect per-thread transfer  
        data. This method can be called by multiple threads, so shared instance  
        data is protected by a thread lock.  
    """  
    thread = threading.current_thread()  
    with self._lock:  
        self._total_transferred += bytes_transferred  
        if thread.ident not in self.thread_info.keys():  
            self.thread_info[thread.ident] = bytes_transferred  
        else:  
            self.thread_info[thread.ident] += bytes_transferred  
  
    target = self._target_size * MB  
    sys.stdout.write(  
        f"\r{self._total_transferred} of {target} transferred "  
        f"({(self._total_transferred / target) * 100:.2f}%).")  
    sys.stdout.flush()

## Work with Amazon S3 versioned objects using an AWS SDK

The following code example shows how to:

- Create a versioned S3 bucket.
- Get all versions of an object.
- Roll an object back to a previous version.
- Delete and restore a versioned object.
- Permanently delete all versions of an object.

### Python

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create functions that wrap S3 actions.

```
def create_versioned_bucket(bucket_name, prefix):
    """
    Creates an Amazon S3 bucket, enables it for versioning, and configures a
    lifecycle
    that expires noncurrent object versions after 7 days.

    Adding a lifecycle configuration to a versioned bucket is a best practice.
    It helps prevent objects in the bucket from accumulating a large number of
    noncurrent versions, which can slow down request performance.

    Usage is shown in the usage_demo_single_object function at the end of this
    module.

    :param bucket_name: The name of the bucket to create.
    :param prefix: Identifies which objects are automatically expired under the
                   configured lifecycle rules.
    :return: The newly created bucket.
    """
    try:
        bucket = s3.create_bucket(
            Bucket=bucket_name,
            CreateBucketConfiguration={
                'LocationConstraint': s3.meta.client.meta.region_name
            }

## Cross-service examples for Amazon S3 using AWS SDKs

The following code examples show how to use Amazon Simple Storage Service with AWS SDKs. Each example contains a sample application that works across multiple AWS services.

### Examples

- [Build an Amazon Transcribe app \(p. 1824\)](#)
- [Convert text to speech and back to text using an AWS SDK \(p. 1825\)](#)
- [Create a long-lived Amazon EMR cluster and run several steps using an AWS SDK \(p. 1825\)](#)
- [Create a short-lived Amazon EMR cluster and run a step using an AWS SDK \(p. 1826\)](#)
- [Create an Amazon Textract explorer application \(p. 1826\)](#)
- [Detect PPE in images with Amazon Rekognition using an AWS SDK \(p. 1827\)](#)
- [Detect entities in text extracted from an image using an AWS SDK \(p. 1828\)](#)
- [Detect faces in an image using an AWS SDK \(p. 1829\)](#)
- [Detect objects in images with Amazon Rekognition using an AWS SDK \(p. 1829\)](#)
- [Detect people and objects in a video with Amazon Rekognition using an AWS SDK \(p. 1832\)](#)
- [Save EXIF and other image information using an AWS SDK \(p. 1832\)](#)

## Build an Amazon Transcribe app

The following code example shows how to use Amazon Transcribe to transcribe and display voice recordings in the browser.

JavaScript

### SDK for JavaScript V3

Create an app that uses Amazon Transcribe to transcribe and display voice recordings in the browser. The app uses two Amazon Simple Storage Service (Amazon S3) buckets, one to host the application code, and another to store transcriptions. The app uses an Amazon Cognito user pool to authenticate your users. Authenticated users have AWS Identity and Access Management (IAM) permissions to access the required AWS services.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

This example is also available in the [AWS SDK for JavaScript v3 developer guide](#).

### Services used in this example

- Amazon Cognito Identity
- Amazon S3
- Amazon Transcribe

## Convert text to speech and back to text using an AWS SDK

The following code example shows how to:

- Use Amazon Polly to synthesize a plain text (UTF-8) input file to an audio file.
- Upload the audio file to an Amazon Simple Storage Service (Amazon S3) bucket.
- Use Amazon Transcribe to convert the audio file to text.
- Display the text.

Rust

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

Use Amazon Polly to synthesize a plain text (UTF-8) input file to an audio file, upload the audio file to an Amazon Simple Storage Service bucket, use Amazon Transcribe to convert that audio file to text, and display the text.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Polly
- Amazon S3
- Amazon Transcribe

## Create a long-lived Amazon EMR cluster and run several steps using an AWS SDK

The following code example shows how to create a long-lived Amazon EMR cluster and run several steps.

Python

### SDK for Python (Boto3)

Create a long-lived Amazon EMR cluster that uses Apache Spark to query historical Amazon review data from the [Amazon Customer Reviews Dataset](#). Run a job that gets data for top-rated products in specific categories that contain keywords in their product titles. Job results are written to an Amazon Simple Storage Service (Amazon S3) bucket.

- Create an Amazon S3 bucket and upload a job script.
- Create AWS Identity and Access Management (IAM) roles.

- Create Amazon Elastic Compute Cloud (Amazon EC2) security groups.
- Create a long-lived cluster and run several job steps.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### **Services used in this example**

- Amazon EC2
- Amazon EMR
- IAM
- Amazon S3

## Create a short-lived Amazon EMR cluster and run a step using an AWS SDK

The following code example shows how to create a short-lived Amazon EMR cluster that runs a step and automatically terminates after the step completes.

Python

#### **SDK for Python (Boto3)**

Create a short-lived Amazon EMR cluster that estimates the value of pi using Apache Spark to parallelize a large number of calculations. The job writes output to Amazon EMR logs and to an Amazon Simple Storage Service (Amazon S3) bucket. The cluster terminates itself after completing the job.

- Create an Amazon S3 bucket and upload a job script.
- Create AWS Identity and Access Management (IAM) roles.
- Create Amazon Elastic Compute Cloud (Amazon EC2) security groups.
- Create a short-lived cluster and run a single job step.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### **Services used in this example**

- Amazon EC2
- Amazon EMR
- IAM
- Amazon S3

## Create an Amazon Textract explorer application

The following code examples show how to explore Amazon Textract output through an interactive application.

JavaScript

#### **SDK for JavaScript V3**

Shows how to use the AWS SDK for JavaScript to build a React application that uses Amazon Textract to extract data from a document image and display it in an interactive web page.

This example runs in a web browser and requires an authenticated Amazon Cognito identity for credentials. It uses Amazon Simple Storage Service (Amazon S3) for storage, and for notifications it polls an Amazon Simple Queue Service (Amazon SQS) queue that is subscribed to an Amazon Simple Notification Service (Amazon SNS) topic.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Cognito Identity
- Amazon S3
- Amazon SNS
- Amazon SQS
- Amazon Textract

Python

#### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) with Amazon Textract to detect text, form, and table elements in a document image. The input image and Amazon Textract output are shown in a Tkinter application that lets you explore the detected elements.

- Submit a document image to Amazon Textract and explore the output of detected elements.
- Submit images directly to Amazon Textract or through an Amazon Simple Storage Service (Amazon S3) bucket.
- Use asynchronous APIs to start a job that publishes a notification to an Amazon Simple Notification Service (Amazon SNS) topic when the job completes.
- Poll an Amazon Simple Queue Service (Amazon SQS) queue for a job completion message and display the results.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon S3
- Amazon SNS
- Amazon SQS
- Amazon Textract

## Detect PPE in images with Amazon Rekognition using an AWS SDK

The following code examples show how to build an app that uses Amazon Rekognition to detect Personal Protective Equipment (PPE) in images.

Java

#### SDK for Java 2.x

Shows how to create an AWS Lambda function that detects images with Personal Protective Equipment.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- DynamoDB
- Amazon Rekognition
- Amazon S3
- Amazon SES

JavaScript

#### SDK for JavaScript V3

Shows how to use Amazon Rekognition with the AWS SDK for JavaScript to create an application to detect personal protective equipment (PPE) in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app saves the results to an Amazon DynamoDB table, and sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

Learn how to:

- Create an unauthenticated user using Amazon Cognito.
- Analyze images for PPE using Amazon Rekognition.
- Verify an email address for Amazon SES.
- Update a DynamoDB table with results.
- Send an email notification using Amazon SES.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- DynamoDB
- Amazon Rekognition
- Amazon S3
- Amazon SES

## Detect entities in text extracted from an image using an AWS SDK

The following code example shows how to use Amazon Comprehend to detect entities in text extracted by Amazon Textract from an image that is stored in Amazon S3.

Python

#### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) in a Jupyter notebook to detect entities in text that is extracted from an image. This example uses Amazon Textract to extract text from an image stored in Amazon Simple Storage Service (Amazon S3) and Amazon Comprehend to detect entities in the extracted text.

This example is a Jupyter notebook and must be run in an environment that can host notebooks. For instructions on how to run the example using Amazon SageMaker, see the directions in [TextractAndComprehendNotebook.ipynb](#).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Comprehend
- Amazon S3
- Amazon Textract

## Detect faces in an image using an AWS SDK

The following code example shows how to:

- Save an image in an Amazon Simple Storage Service Amazon S3 bucket.
- Use Amazon Rekognition (Amazon Rekognition) to detect facial details, such as age range, gender, and emotion (smiling, etc.).
- Display those details.

Rust

#### SDK for Rust

##### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

Save the image in an Amazon Simple Storage Service bucket with an **uploads** prefix, use Amazon Rekognition to detect facial details, such as age range, gender, and emotion (smiling, etc.), and display those details.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Rekognition
- Amazon S3

## Detect objects in images with Amazon Rekognition using an AWS SDK

The following code examples show how to build an app that uses Amazon Rekognition to detect objects by category in images.

.NET

#### AWS SDK for .NET

Shows how to use Amazon Rekognition .NET API to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon

S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### **Services used in this example**

- Amazon Rekognition
- Amazon S3
- Amazon SES

Java

#### **SDK for Java 2.x**

Shows how to use Amazon Rekognition Java API to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### **Services used in this example**

- Amazon Rekognition
- Amazon S3
- Amazon SES

JavaScript

#### **SDK for JavaScript V3**

Shows how to use Amazon Rekognition with the AWS SDK for JavaScript to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

Learn how to:

- Create an unauthenticated user using Amazon Cognito.
- Analyze images for objects using Amazon Rekognition.
- Verify an email address for Amazon SES.
- Send an email notification using Amazon SES.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### **Services used in this example**

- Amazon Rekognition
- Amazon S3
- Amazon SES

## Kotlin

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

Shows how to use Amazon Rekognition Kotlin API to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

## Python

### SDK for Python (Boto3)

Shows you how to use the AWS SDK for Python (Boto3) to create a web application that lets you do the following:

- Upload photos to an Amazon Simple Storage Service (Amazon S3) bucket.
- Use Amazon Rekognition to analyze and label the photos.
- Use Amazon Simple Email Service (Amazon SES) to send email reports of image analysis.

This example contains two main components: a webpage written in JavaScript that is built with React, and a REST service written in Python that is built with Flask-RESTful.

You can use the React webpage to:

- Display a list of images that are stored in your S3 bucket.
- Upload images from your computer to your S3 bucket.
- Display images and labels that identify items that are detected in the image.
- Get a report of all images in your S3 bucket and send an email of the report.

The webpage calls the REST service. The service sends requests to AWS to perform the following actions:

- Get and filter the list of images in your S3 bucket.
- Upload photos to your S3 bucket.
- Use Amazon Rekognition to analyze individual photos and get a list of labels that identify items that are detected in the photo.
- Analyze all photos in your S3 bucket and use Amazon SES to email a report.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

## Detect people and objects in a video with Amazon Rekognition using an AWS SDK

The following code examples show how to detect people and objects in a video with Amazon Rekognition.

Java

### SDK for Java 2.x

Shows how to use Amazon Rekognition Java API to create an app to detect faces and objects in videos located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

JavaScript

### SDK for JavaScript V3

Shows how to use Amazon Rekognition with the AWS SDK for JavaScript to create an app to detect faces and objects in videos located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

Learn how to:

- Create an unauthenticated user using Amazon Cognito.
- Analyze images for PPE using Amazon Rekognition.
- Verify an email address for Amazon SES.
- Send an email notification using Amazon SES.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

## Save EXIF and other image information using an AWS SDK

The following code example shows how to:

- Get EXIF information from a a JPG, JPEG, or PNG file.
- Upload the image file to an Amazon Simple Storage Service (Amazon S3) bucket.
- Use Amazon Rekognition (Amazon Rekognition) to identify the three top attributes (labels in Amazon Rekognition) in the file.

- Add the EXIF and label information to a Amazon DynamoDB (DynamoDB) table in the Region.

Rust

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

Get EXIF information from a JPG, JPEG, or PNG file, upload the image file to an Amazon Simple Storage Service bucket, use Amazon Rekognition to identify the three top attributes (*labels* in Amazon Rekognition) in the file, and add the EXIF and label information to a Amazon DynamoDB table in the Region.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- DynamoDB
- Amazon Rekognition
- Amazon S3

## Code examples for S3 Glacier using AWS SDKs

The following code examples show how to use Amazon S3 Glacier with an AWS software development kit (SDK).

### Code examples

- [Actions for S3 Glacier using AWS SDKs \(p. 1834\)](#)
  - Add tags to an Amazon S3 Glacier vault using an AWS SDK (p. 1834)
  - Create a multipart upload to an Amazon S3 Glacier vault using an AWS SDK (p. 1835)
  - Create an Amazon S3 Glacier vault using an AWS SDK (p. 1836)
  - Delete an Amazon S3 Glacier vault using an AWS SDK (p. 1839)
  - Delete an Amazon S3 Glacier archive using an AWS SDK (p. 1840)
  - Delete Amazon S3 Glacier vault notifications using an AWS SDK (p. 1841)
  - Describe an Amazon S3 Glacier job using an AWS SDK (p. 1842)
  - Download an Amazon S3 Glacier archive using an AWS SDK (p. 1843)
  - Get Amazon S3 Glacier job output using an AWS SDK (p. 1844)
  - Get Amazon S3 Glacier vault notification configuration using an AWS SDK (p. 1845)
  - List Amazon S3 Glacier jobs using an AWS SDK (p. 1846)
  - List tags for an Amazon S3 Glacier vault using an AWS SDK (p. 1848)
  - List Amazon S3 Glacier vaults using an AWS SDK (p. 1848)
  - Retrieve an Amazon S3 Glacier vault inventory using an AWS SDK (p. 1851)
  - Retrieve an archive from an Amazon S3 Glacier vault using an AWS SDK (p. 1853)
  - Set Amazon S3 Glacier vault notifications using an AWS SDK (p. 1854)
  - Upload an archive to an Amazon S3 Glacier vault using an AWS SDK (p. 1854)
- [Scenarios for S3 Glacier using AWS SDKs \(p. 1860\)](#)
  - Archive a file to Amazon S3 Glacier, get notifications, and initiate a job using an AWS SDK (p. 1860)

- Get Amazon S3 Glacier archive content and delete the archive using an AWS SDK (p. 1864)

## Actions for S3 Glacier using AWS SDKs

The following code examples show how to use Amazon S3 Glacier with AWS SDKs. Each example calls an individual service function.

### Examples

- Add tags to an Amazon S3 Glacier vault using an AWS SDK (p. 1834)
- Create a multipart upload to an Amazon S3 Glacier vault using an AWS SDK (p. 1835)
- Create an Amazon S3 Glacier vault using an AWS SDK (p. 1836)
- Delete an Amazon S3 Glacier vault using an AWS SDK (p. 1839)
- Delete an Amazon S3 Glacier archive using an AWS SDK (p. 1840)
- Delete Amazon S3 Glacier vault notifications using an AWS SDK (p. 1841)
- Describe an Amazon S3 Glacier job using an AWS SDK (p. 1842)
- Download an Amazon S3 Glacier archive using an AWS SDK (p. 1843)
- Get Amazon S3 Glacier job output using an AWS SDK (p. 1844)
- Get Amazon S3 Glacier vault notification configuration using an AWS SDK (p. 1845)
- List Amazon S3 Glacier jobs using an AWS SDK (p. 1846)
- List tags for an Amazon S3 Glacier vault using an AWS SDK (p. 1848)
- List Amazon S3 Glacier vaults using an AWS SDK (p. 1848)
- Retrieve an Amazon S3 Glacier vault inventory using an AWS SDK (p. 1851)
- Retrieve an archive from an Amazon S3 Glacier vault using an AWS SDK (p. 1853)
- Set Amazon S3 Glacier vault notifications using an AWS SDK (p. 1854)
- Upload an archive to an Amazon S3 Glacier vault using an AWS SDK (p. 1854)

## Add tags to an Amazon S3 Glacier vault using an AWS SDK

The following code example shows how to add tags to an Amazon S3 Glacier vault.

.NET

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.Collections.Generic;
using System.Threading.Tasks;
using Amazon.Glacier;
using Amazon.Glacier.Model;

public class AddTagsToVault
{
    public static async Task Main(string[] args)
    {
        string vaultName = "example-vault";

        var client = new AmazonGlacierClient();
        var request = new AddTagsToVaultRequest
```

```
        {
            Tags = new Dictionary<string, string>
            {
                { "examplekey1", "examplevalue1" },
                { "examplekey2", "examplevalue2" },
            },
            AccountId = "-",
            VaultName = vaultName,
        };

        var response = await client.AddTagsToVaultAsync(request);
    }
}
```

- For API details, see [AddTagsToVault](#) in *AWS SDK for .NET API Reference*.

## Create a multipart upload to an Amazon S3 Glacier vault using an AWS SDK

The following code example shows how to create a multipart upload to an Amazon S3 Glacier vault.

JavaScript

### SDK for JavaScript V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a multipart upload of 1 megabyte chunks of a Buffer object.

```
// Create a new service object and some supporting variables
var glacier = new AWS.Glacier({apiVersion: '2012-06-01'}),
    vaultName = 'YOUR_VAULT_NAME',
    buffer = new Buffer(2.5 * 1024 * 1024), // 2.5MB buffer
    partSize = 1024 * 1024, // 1MB chunks,
    numPartsLeft = Math.ceil(buffer.length / partSize),
    startTime = new Date(),
    params = {vaultName: vaultName, partSize: partSize.toString()};

// Compute the complete SHA-256 tree hash so we can pass it
// to completeMultipartUpload request at the end
var treeHash = glacier.computeChecksums(buffer).treeHash;

// Initiate the multipart upload
console.log('Initiating upload to', vaultName);
// Call Glacier to initiate the upload.
glacier.initiateMultipartUpload(params, function (mpErr, multipart) {
    if (mpErr) { console.log('Error!', mpErr.stack); return; }
    console.log("Got upload ID", multipart.uploadId);

    // Grab each partSize chunk and upload it as a part
    for (var i = 0; i < buffer.length; i += partSize) {
        var end = Math.min(i + partSize, buffer.length),
            partParams = {
                vaultName: vaultName,
                uploadId: multipart.uploadId,
                range: 'bytes ' + i + '-' + (end-1) + '/*',
                body: buffer.slice(i, end)
            };
    }
});
```

```
// Send a single part
console.log('Uploading part', i, '=', partParams.range);

## Create an Amazon S3 Glacier vault using an AWS SDK

The following code examples show how to create an Amazon S3 Glacier vault.

.NET

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.Threading.Tasks;
using Amazon.Glacier;
using Amazon.Glacier.Model;

public class CreateVault
{
    static async Task Main(string[] args)
    {
        string vaultName = "example-vault";
        var client = new AmazonGlacierClient();
        var request = new CreateVaultRequest
        {
```

```
// Setting the AccountId to "-" means that
// the account associated with the default
// client will be used.
AccountId = "-",
VaultName = vaultName,
};

var response = await client.CreateVaultAsync(request);

Console.WriteLine($"Created {vaultName} at: {response.Location}");
}
```

- For API details, see [CreateVault in AWS SDK for .NET API Reference](#).

## Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void createGlacierVault(GlacierClient glacier, String vaultName ) {

    try {
        CreateVaultRequest vaultRequest = CreateVaultRequest.builder()
            .vaultName(vaultName)
            .build();

        CreateVaultResponse createVaultResult =
glacier.createVault(vaultRequest);
        System.out.println("The URI of the new vault is " +
createVaultResult.location());

    } catch(GlacierException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [CreateVault in AWS SDK for Java 2.x API Reference](#).

## JavaScript

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
const { GlacierClient } = require("@aws-sdk/client-glacier");
// Set the AWS Region.
const REGION = "REGION";
//Set the Redshift Service Object
```

```
const glacierClient = new GlacierClient({ region: REGION });
export { glacierClient };
```

Create the vault.

```
// Load the SDK for JavaScript
import { CreateVaultCommand } from "@aws-sdk/client-glacier";
import { glacierClient } from "./libs/glacierClient.js";

// Set the parameters
const vaultname = "VAULT_NAME"; // VAULT_NAME
const params = { vaultName: vaultname };

const run = async () => {
  try {
    const data = await glacierClient.send(new CreateVaultCommand(params));
    console.log("Success, vault created!");
    return data; // For unit tests.
  } catch (err) {
    console.log("Error");
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [CreateVault in AWS SDK for JavaScript API Reference](#).

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Load the SDK for JavaScript
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create a new service object
var glacier = new AWS.Glacier({apiVersion: '2012-06-01'});
// Call Glacier to create the vault
glacier.createVault({vaultName: 'YOUR_VAULT_NAME'}, function(err) {
  if (!err) {
    console.log("Created vault!")
  }
});
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [CreateVault in AWS SDK for JavaScript API Reference](#).

## Scenarios for S3 Glacier using AWS SDKs

The following code examples show how to use Amazon S3 Glacier with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Archive a file to Amazon S3 Glacier, get notifications, and initiate a job using an AWS SDK \(p. 1860\)](#)
- [Get Amazon S3 Glacier archive content and delete the archive using an AWS SDK \(p. 1864\)](#)

## Archive a file to Amazon S3 Glacier, get notifications, and initiate a job using an AWS SDK

The following code example shows how to:

- Create an Amazon S3 Glacier vault.
- Configure the vault to publish notifications to an Amazon Simple Notification Service (Amazon SNS) topic.
- Upload an archive file to the vault.
- Initiate an archive retrieval job.

### Python

#### [SDK for Python \(Boto3\)](#)

## Scenarios for Amazon SES using AWS SDKs

The following code examples show how to use Amazon Simple Email Service with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Copy Amazon SES email and domain identities from one AWS Region to another using an AWS SDK \(p. 1897\)](#)
- [Generate credentials to connect to an Amazon SES SMTP endpoint \(p. 1903\)](#)
- [Verify an email identity and send messages with Amazon SES using an AWS SDK \(p. 1904\)](#)

## Copy Amazon SES email and domain identities from one AWS Region to another using an AWS SDK

The following code example shows how to copy Amazon SES email and domain identities from one AWS Region to another. When domain identities are managed by Route 53, verification records are copied to the domain for the destination Region.

### Python

## Cross-service examples for Amazon SES using AWS SDKs

The following code examples show how to use Amazon Simple Email Service with AWS SDKs. Each example contains a sample application that works across multiple AWS services.

### Examples

- [Build an Amazon Transcribe streaming app \(p. 1912\)](#)
- [Create a web application to track DynamoDB data \(p. 1913\)](#)
- [Create an Amazon Redshift item tracker \(p. 1914\)](#)
- [Create an Aurora Serverless work item tracker \(p. 1915\)](#)
- [Detect PPE in images with Amazon Rekognition using an AWS SDK \(p. 1918\)](#)
- [Detect objects in images with Amazon Rekognition using an AWS SDK \(p. 1919\)](#)
- [Detect people and objects in a video with Amazon Rekognition using an AWS SDK \(p. 1921\)](#)
- [Use Step Functions to invoke Lambda functions \(p. 1922\)](#)

## Build an Amazon Transcribe streaming app

The following code example shows how to build an app that records, transcribes, and translates live audio in real-time, and emails the results.

JavaScript

### SDK for JavaScript V3

Shows how to use Amazon Transcribe to build an app that records, transcribes, and translates live audio in real-time, and emails the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Comprehend

- Amazon SES
- Amazon Transcribe
- Amazon Translate

## Create a web application to track DynamoDB data

The following code examples show how to create a web application that tracks work items in an Amazon DynamoDB table and uses Amazon Simple Email Service (Amazon SES) to send reports.

.NET

### AWS SDK for .NET

Shows how to use the Amazon DynamoDB .NET API to create a dynamic web application that tracks DynamoDB work data.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- DynamoDB
- Amazon SES

Java

### SDK for Java 2.x

Shows how to use the Amazon DynamoDB API to create a dynamic web application that tracks DynamoDB work data.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- DynamoDB
- Amazon SES

JavaScript

### SDK for JavaScript V3

Shows how to use the Amazon DynamoDB API to create a dynamic web application that tracks DynamoDB work data.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- DynamoDB
- Amazon SES

## Kotlin

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

Shows how to use the Amazon DynamoDB API to create a dynamic web application that tracks DynamoDB work data.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- DynamoDB
- Amazon SES

## Python

### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) to create a REST service that tracks work items in Amazon DynamoDB and emails reports by using Amazon Simple Email Service (Amazon SES). This example uses the Flask web framework to handle HTTP routing and integrates with a React webpage to present a fully functional web application.

- Build a Flask REST service that integrates with AWS services.
- Read, write, and update work items that are stored in a DynamoDB table.
- Use Amazon SES to send email reports of work items.

For complete source code and instructions on how to set up and run, see the full example in the [AWS Code Examples Repository](#) on GitHub.

#### Services used in this example

- DynamoDB
- Amazon SES

## Create an Amazon Redshift item tracker

The following code examples show how to create a web application that tracks and reports on work items using an Amazon Redshift database.

## Java

### SDK for Java 2.x

Shows how to create a web application that tracks and reports on work items stored in an Amazon Redshift database.

For complete source code and instructions on how to set up a Spring REST API that queries Amazon Redshift data and for use by a React application, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Redshift

- Amazon SES

Kotlin

#### SDK for Kotlin

##### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

Shows how to create a web application that tracks and reports on work items stored in an Amazon Redshift database.

For complete source code and instructions on how to set up a Spring REST API that queries Amazon Redshift data and for use by a React application, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Redshift
- Amazon SES

## Create an Aurora Serverless work item tracker

The following code examples show how to create a web application that tracks work items in an Amazon Aurora Serverless database and uses Amazon Simple Email Service (Amazon SES) to send reports.

.NET

#### AWS SDK for .NET

Shows how to use the AWS SDK for .NET to create a web application that tracks work items in an Amazon Aurora database and emails reports by using Amazon Simple Email Service (Amazon SES). This example uses a front end built with React.js to interact with a RESTful .NET backend.

- Integrate a React web application with AWS services.
- List, add, update, and delete items in an Aurora table.
- Send an email report of filtered work items using Amazon SES.
- Deploy and manage example resources with the included AWS CloudFormation script.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

C++

#### SDK for C++

Shows how to create a web application that tracks and reports on work items stored in an Amazon Aurora Serverless database.

For complete source code and instructions on how to set up a C++ REST API that queries Amazon Aurora Serverless data and for use by a React application, see the full example on [GitHub](#).

### Services used in this example

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

Java

#### SDK for Java 2.x

Shows how to create a web application that tracks and reports on work items stored in an Amazon RDS database.

For complete source code and instructions on how to set up a Spring REST API that queries Amazon Aurora Serverless data and for use by a React application, see the full example on [GitHub](#).

For complete source code and instructions on how to set up and run an example that uses the JDBC API, see the full example on [GitHub](#).

### Services used in this example

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

JavaScript

#### SDK for JavaScript V3

Shows how to use the AWS SDK for JavaScript (v3) to create a web application that tracks work items in an Amazon Aurora database and emails reports by using Amazon Simple Email Service (Amazon SES). This example uses a front end built with React.js to interact with an Express Node.js backend.

- Integrate a React.js web application with AWS services.
- List, add, and update items in an Aurora table.
- Send an email report of filtered work items by using Amazon SES.
- Deploy and manage example resources with the included AWS CloudFormation script.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Aurora
- Amazon RDS
- Amazon RDS Data Service

- Amazon SES

Kotlin

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

Shows how to create a web application that tracks and reports on work items stored in an Amazon RDS database.

For complete source code and instructions on how to set up a Spring REST API that queries Amazon Aurora Serverless data and for use by a React application, see the full example on [GitHub](#).

#### Services used in this example

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

PHP

### SDK for PHP

Shows how to use the AWS SDK for PHP to create a web application that tracks work items in an Amazon RDS database and emails reports by using Amazon Simple Email Service (Amazon SES). This example uses a front end built with React.js to interact with a RESTful PHP backend.

- Integrate a React.js web application with AWS services.
- List, add, update, and delete items in an Amazon RDS table.
- Send an email report of filtered work items using Amazon SES.
- Deploy and manage example resources with the included AWS CloudFormation script.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

Python

### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) to create a REST service that tracks work items in an Amazon Aurora Serverless database and emails reports by using Amazon Simple Email Service (Amazon SES). This example uses the Flask web framework to handle HTTP routing and integrates with a React webpage to present a fully functional web application.

- Build a Flask REST service that integrates with AWS services.
- Read, write, and update work items that are stored in an Aurora Serverless database.
- Create an AWS Secrets Manager secret that contains database credentials and use it to authenticate calls to the database.
- Use Amazon SES to send email reports of work items.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### **Services used in this example**

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

## **Detect PPE in images with Amazon Rekognition using an AWS SDK**

The following code examples show how to build an app that uses Amazon Rekognition to detect Personal Protective Equipment (PPE) in images.

Java

#### **SDK for Java 2.x**

Shows how to create an AWS Lambda function that detects images with Personal Protective Equipment.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### **Services used in this example**

- DynamoDB
- Amazon Rekognition
- Amazon S3
- Amazon SES

JavaScript

#### **SDK for JavaScript V3**

Shows how to use Amazon Rekognition with the AWS SDK for JavaScript to create an application to detect personal protective equipment (PPE) in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app saves the results to an Amazon DynamoDB table, and sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

Learn how to:

- Create an unauthenticated user using Amazon Cognito.
- Analyze images for PPE using Amazon Rekognition.
- Verify an email address for Amazon SES.

- Update a DynamoDB table with results.
- Send an email notification using Amazon SES.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### **Services used in this example**

- DynamoDB
- Amazon Rekognition
- Amazon S3
- Amazon SES

## Detect objects in images with Amazon Rekognition using an AWS SDK

The following code examples show how to build an app that uses Amazon Rekognition to detect objects by category in images.

.NET

#### **AWS SDK for .NET**

Shows how to use Amazon Rekognition .NET API to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### **Services used in this example**

- Amazon Rekognition
- Amazon S3
- Amazon SES

Java

#### **SDK for Java 2.x**

Shows how to use Amazon Rekognition Java API to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### **Services used in this example**

- Amazon Rekognition
- Amazon S3
- Amazon SES

## JavaScript

### SDK for JavaScript V3

Shows how to use Amazon Rekognition with the AWS SDK for JavaScript to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

Learn how to:

- Create an unauthenticated user using Amazon Cognito.
- Analyze images for objects using Amazon Rekognition.
- Verify an email address for Amazon SES.
- Send an email notification using Amazon SES.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

## Kotlin

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

Shows how to use Amazon Rekognition Kotlin API to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

## Python

### SDK for Python (Boto3)

Shows you how to use the AWS SDK for Python (Boto3) to create a web application that lets you do the following:

- Upload photos to an Amazon Simple Storage Service (Amazon S3) bucket.
- Use Amazon Rekognition to analyze and label the photos.
- Use Amazon Simple Email Service (Amazon SES) to send email reports of image analysis.

This example contains two main components: a webpage written in JavaScript that is built with React, and a REST service written in Python that is built with Flask-RESTful.

You can use the React webpage to:

- Display a list of images that are stored in your S3 bucket.
- Upload images from your computer to your S3 bucket.
- Display images and labels that identify items that are detected in the image.
- Get a report of all images in your S3 bucket and send an email of the report.

The webpage calls the REST service. The service sends requests to AWS to perform the following actions:

- Get and filter the list of images in your S3 bucket.
- Upload photos to your S3 bucket.
- Use Amazon Rekognition to analyze individual photos and get a list of labels that identify items that are detected in the photo.
- Analyze all photos in your S3 bucket and use Amazon SES to email a report.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### **Services used in this example**

- Amazon Rekognition
- Amazon S3
- Amazon SES

## Detect people and objects in a video with Amazon Rekognition using an AWS SDK

The following code examples show how to detect people and objects in a video with Amazon Rekognition.

Java

### **SDK for Java 2.x**

Shows how to use Amazon Rekognition Java API to create an app to detect faces and objects in videos located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### **Services used in this example**

- Amazon Rekognition
- Amazon S3
- Amazon SES

JavaScript

### **SDK for JavaScript V3**

Shows how to use Amazon Rekognition with the AWS SDK for JavaScript to create an app to detect faces and objects in videos located in an Amazon Simple Storage Service (Amazon S3)

bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

Learn how to:

- Create an unauthenticated user using Amazon Cognito.
- Analyze images for PPE using Amazon Rekognition.
- Verify an email address for Amazon SES.
- Send an email notification using Amazon SES.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### **Services used in this example**

- Amazon Rekognition
- Amazon S3
- Amazon SES

## **Use Step Functions to invoke Lambda functions**

The following code examples show how to create an AWS Step Functions state machine that invokes AWS Lambda functions in sequence.

Java

#### **SDK for Java 2.x**

Shows how to create an AWS serverless workflow by using AWS Step Functions and the AWS SDK for Java 2.x. Each workflow step is implemented using an AWS Lambda function.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### **Services used in this example**

- DynamoDB
- Lambda
- Amazon SES
- Step Functions

JavaScript

#### **SDK for JavaScript V3**

Shows how to create an AWS serverless workflow by using AWS Step Functions and the AWS SDK for JavaScript. Each workflow step is implemented using an AWS Lambda function.

Lambda is a compute service that enables you to run code without provisioning or managing servers. Step Functions is a serverless orchestration service that lets you combine Lambda functions and other AWS services to build business-critical applications.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

This example is also available in the [AWS SDK for JavaScript v3 developer guide](#).

### Services used in this example

- DynamoDB
- Lambda
- Amazon SES
- Step Functions

## Code examples for Amazon SES API v2 using AWS SDKs

The following code examples show how to use Amazon Simple Email Service API v2 with an AWS software development kit (SDK).

### Code examples

- [Actions for Amazon SES API v2 using AWS SDKs \(p. 1923\)](#)
  - Create an Amazon SES API v2 contact in a contact list using an AWS SDK (p. 1923)
  - Create an Amazon SES API v2 contact list using an AWS SDK (p. 1924)
  - Get information about an Amazon SES API v2 identity using an AWS SDK (p. 1924)
  - List the Amazon SES API v2 contact lists using an AWS SDK (p. 1925)
  - List the contacts in an Amazon SES API v2 contact list using an AWS SDK (p. 1926)
  - Send an Amazon SES API v2 email using an AWS SDK (p. 1926)

## Actions for Amazon SES API v2 using AWS SDKs

The following code examples show how to use Amazon Simple Email Service API v2 with AWS SDKs. Each example calls an individual service function.

### Examples

- [Create an Amazon SES API v2 contact in a contact list using an AWS SDK \(p. 1923\)](#)
- [Create an Amazon SES API v2 contact list using an AWS SDK \(p. 1924\)](#)
- [Get information about an Amazon SES API v2 identity using an AWS SDK \(p. 1924\)](#)
- [List the Amazon SES API v2 contact lists using an AWS SDK \(p. 1925\)](#)
- [List the contacts in an Amazon SES API v2 contact list using an AWS SDK \(p. 1926\)](#)
- [Send an Amazon SES API v2 email using an AWS SDK \(p. 1926\)](#)

## Create an Amazon SES API v2 contact in a contact list using an AWS SDK

The following code example shows how to create an Amazon SES API v2 contact in a contact list.

Rust

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn add_contact(client: &Client, list: &str, email: &str) -> Result<(), Error> {
    client
        .create_contact()
        .contact_list_name(list)
        .email_address(email)
        .send()
        .await?;

    println!("Created contact");

    Ok(())
}
```

- For API details, see [CreateContact](#) in *AWS SDK for Rust API reference*.

## Create an Amazon SES API v2 contact list using an AWS SDK

The following code example shows how to create an Amazon SES API v2 contact list.

Rust

### SDK for Rust

**Note**

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn make_list(client: &Client, contact_list: &str) -> Result<(), Error> {
    client
        .create_contact_list()
        .contact_list_name(contact_list)
        .send()
        .await?;

    println!("Created contact list.");

    Ok(())
}
```

- For API details, see [CreateContactList](#) in *AWS SDK for Rust API reference*.

## Get information about an Amazon SES API v2 identity using an AWS SDK

The following code example shows how to get Amazon SES API v2 identity information.

Rust

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Determines whether an email address has been verified.

```
async fn is_verified(client: &Client, email: &str) -> Result<(), Error> {
    let resp = client
        .get_email_identity()
        .email_identity(email)
        .send()
        .await?;

    if resp.verified_for_sending_status() {
        println!("The address is verified");
    } else {
        println!("The address is not verified");
    }

    Ok(())
}
```

- For API details, see [GetEmailIdentity](#) in *AWS SDK for Rust API reference*.

## List the Amazon SES API v2 contact lists using an AWS SDK

The following code example shows how to list the Amazon SES API v2 contact lists.

Rust

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn show_lists(client: &Client) -> Result<(), Error> {
    let resp = client.list_contact_lists().send().await?;

    println!("Contact lists:");

    for list in resp.contact_lists().unwrap_or_default() {
        println!("  {}", list.contact_list_name().unwrap_or_default());
    }

    Ok(())
}
```

- For API details, see [ListContactLists](#) in *AWS SDK for Rust API reference*.

## List the contacts in an Amazon SES API v2 contact list using an AWS SDK

The following code example shows how to list the contacts in an Amazon SES API v2 contact list.

Rust

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn show_contacts(client: &Client, list: &str) -> Result<(), Error> {
    let resp = client
        .list_contacts()
        .contact_list_name(list)
        .send()
        .await?;

    println!("Contacts:");

    for contact in resp.contacts().unwrap_or_default() {
        println!("  {}", contact.email_address().unwrap_or_default());
    }

    Ok(())
}
```

- For API details, see [ListContacts](#) in *AWS SDK for Rust API reference*.

## Send an Amazon SES API v2 email using an AWS SDK

The following code examples show how to send an Amazon SES API v2 email.

Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Sends a message.

```
public static void send(SesV2Client client,
                      String sender,
                      String recipient,
                      String subject,
                      String bodyHTML
){
```

```
Destination destination = Destination.builder()
    .toAddresses(recipient)
    .build();

Content content = Content.builder()
    .data(bodyHTML)
    .build();

Content sub = Content.builder()
    .data(subject)
    .build();

Body body = Body.builder()
    .html(content)
    .build();

Message msg = Message.builder()
    .subject(sub)
    .body(body)
    .build();

EmailContent emailContent = EmailContent.builder()
    .simple(msg)
    .build();

SendEmailRequest emailRequest = SendEmailRequest.builder()
    .destination(destination)
    .content(emailContent)
    .fromEmailAddress(sender)
    .build();

try {
    System.out.println("Attempting to send an email through Amazon SES
" + "using the AWS SDK for Java...");
    client.sendEmail(emailRequest);
    System.out.println("email was sent");

} catch (SesV2Exception e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}
}
```

- For API details, see [SendEmail](#) in *AWS SDK for Java 2.x API Reference*.

## Rust

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Sends a message to all members of the contact list.

```
async fn send_message(
    client: &Client,
```

```
list: &str,
from: &str,
subject: &str,
message: &str,
) -> Result<(), Error> {
    // Get list of email addresses from contact list.
    let resp = client
        .list_contacts()
        .contact_list_name(list)
        .send()
        .await?;

    let contacts = resp.contacts().unwrap_or_default();

    let cs: String = contacts
        .iter()
        .map(|i| i.email_address().unwrap_or_default())
        .collect();

    let dest = Destination::builder().to_addresses(cs).build();
    let subject_content =
Content::builder().data(subject).charset("UTF-8").build();
    let body_content = Content::builder().data(message).charset("UTF-8").build();
    let body = Body::builder().text(body_content).build();

## Code examples for Amazon SNS using AWS SDKs

The following code examples show how to use Amazon Simple Notification Service with an AWS software development kit (SDK).

### Code examples

- [Actions for Amazon SNS using AWS SDKs \(p. 1929\)](#)
  - [Add tags to an Amazon SNS topic using an AWS SDK \(p. 1930\)](#)
  - [Check whether a phone number is opted out of Amazon SNS using an AWS SDK \(p. 1931\)](#)
  - [Confirm an endpoint owner wants to receive Amazon SNS messages using an AWS SDK \(p. 1935\)](#)
  - [Create an Amazon SNS topic using an AWS SDK \(p. 1937\)](#)

- Delete an Amazon SNS subscription using an AWS SDK (p. 1943)
- Delete an Amazon SNS topic using an AWS SDK (p. 1947)
- Get the properties of an Amazon SNS topic using an AWS SDK (p. 1952)
- Get the settings for sending Amazon SNS SMS messages using an AWS SDK (p. 1956)
- List phone numbers opted out of Amazon SNS using an AWS SDK (p. 1959)
- List the subscribers of an Amazon SNS topic using an AWS SDK (p. 1961)
- List Amazon SNS topics using an AWS SDK (p. 1967)
- Publish an Amazon SNS SMS text message using an AWS SDK (p. 1973)
- Publish to an Amazon SNS topic using an AWS SDK (p. 1978)
- Set a dead-letter queue for an Amazon SNS subscription using an AWS SDK (p. 1984)
- Set an Amazon SNS filter policy using an AWS SDK (p. 1985)
- Set the default settings for sending Amazon SNS SMS messages using an AWS SDK (p. 1987)
- Set Amazon SNS topic attributes using an AWS SDK (p. 1989)
- Subscribe a Lambda function to receive notifications from an Amazon SNS topic using an AWS SDK (p. 1993)
- Subscribe a mobile application to an Amazon SNS topic using an AWS SDK (p. 1996)
- Subscribe an HTTP endpoint to an Amazon SNS topic using an AWS SDK (p. 1998)
- Subscribe an email address to an Amazon SNS topic using an AWS SDK (p. 2000)
- Scenarios for Amazon SNS using AWS SDKs (p. 2007)
  - Create a platform endpoint for Amazon SNS push notifications using an AWS SDK (p. 2007)
  - Create and publish to a FIFO Amazon SNS topic using an AWS SDK (p. 2008)
  - Publish SMS messages to an Amazon SNS topic using an AWS SDK (p. 2011)
  - Publish a large message to Amazon SNS with Amazon S3 using an AWS SDK (p. 2013)
- Cross-service examples for Amazon SNS using AWS SDKs (p. 2015)
  - Build an application to submit data to a DynamoDB table (p. 2015)
  - Build a publish and subscription application that translates messages (p. 2016)
  - Create an Amazon Textract explorer application (p. 2017)
  - Detect people and objects in a video with Amazon Rekognition using an AWS SDK (p. 2018)
  - Use API Gateway to invoke a Lambda function (p. 2019)
  - Use scheduled events to invoke a Lambda function (p. 2020)

## Actions for Amazon SNS using AWS SDKs

The following code examples show how to use Amazon Simple Notification Service with AWS SDKs. Each example calls an individual service function.

### Examples

- Add tags to an Amazon SNS topic using an AWS SDK (p. 1930)
- Check whether a phone number is opted out of Amazon SNS using an AWS SDK (p. 1931)
- Confirm an endpoint owner wants to receive Amazon SNS messages using an AWS SDK (p. 1935)
- Create an Amazon SNS topic using an AWS SDK (p. 1937)
- Delete an Amazon SNS subscription using an AWS SDK (p. 1943)
- Delete an Amazon SNS topic using an AWS SDK (p. 1947)
- Get the properties of an Amazon SNS topic using an AWS SDK (p. 1952)
- Get the settings for sending Amazon SNS SMS messages using an AWS SDK (p. 1956)

- List phone numbers opted out of Amazon SNS using an AWS SDK (p. 1959)
- List the subscribers of an Amazon SNS topic using an AWS SDK (p. 1961)
- List Amazon SNS topics using an AWS SDK (p. 1967)
- Publish an Amazon SNS SMS text message using an AWS SDK (p. 1973)
- Publish to an Amazon SNS topic using an AWS SDK (p. 1978)
- Set a dead-letter queue for an Amazon SNS subscription using an AWS SDK (p. 1984)
- Set an Amazon SNS filter policy using an AWS SDK (p. 1985)
- Set the default settings for sending Amazon SNS SMS messages using an AWS SDK (p. 1987)
- Set Amazon SNS topic attributes using an AWS SDK (p. 1989)
- Subscribe a Lambda function to receive notifications from an Amazon SNS topic using an AWS SDK (p. 1993)
- Subscribe a mobile application to an Amazon SNS topic using an AWS SDK (p. 1996)
- Subscribe an HTTP endpoint to an Amazon SNS topic using an AWS SDK (p. 1998)
- Subscribe an email address to an Amazon SNS topic using an AWS SDK (p. 2000)

## Add tags to an Amazon SNS topic using an AWS SDK

The following code examples show how to add tags to an Amazon SNS topic.

Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void addTopicTags(SnsClient snsClient, String topicArn) {  
  
    try {  
        Tag tag = Tag.builder()  
            .key("Team")  
            .value("Development")  
            .build();  
  
        Tag tag2 = Tag.builder()  
            .key("Environment")  
            .value("Gamma")  
            .build();  
  
        List<Tag> tagList = new ArrayList<>();  
        tagList.add(tag);  
        tagList.add(tag2);  
  
        TagResourceRequest tagResourceRequest = TagResourceRequest.builder()  
            .resourceArn(topicArn)  
            .tags(tagList)  
            .build();  
  
        snsClient.tagResource(tagResourceRequest);  
        System.out.println("Tags have been added to "+topicArn);  
  
    } catch (SnsException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
}
```

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { SNSClient } from "@aws-sdk/client-sns";  
// Set the AWS Region.  
const REGION = "REGION"; //e.g. "us-east-1"  
// Create SNS service object.  
const snsClient = new SNSClient({ region: REGION });  
export { snsClient };
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js  
import {CheckIfPhoneNumberIsOptedOutCommand } from "@aws-sdk/client-sns";  
import {snsClient } from "./libs/snsClient.js";  
  
// Set the parameters  
const params = { phoneNumber: "353861230764" }; //PHONE_NUMBER, in the E.164 phone  
number structure  
  
const run = async () => {
```

```
try {
    const data = await snsClient.send(
        new CheckIfPhoneNumberIsOptedOutCommand(params)
    );
    console.log("Success.", data);
    return data; // For unit tests.
} catch (err) {
    console.log("Error", err.stack);
}
};

run();
```

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Import the SDK and client modules and call the API.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set region
AWS.config.update({region: 'REGION'});

// Create promise and SNS service object
var getTopicAttribsPromise = new AWS.SNS({apiVersion:
  '2010-03-31'}).getTopicAttributes({TopicArn: 'TOPIC_ARN'}).promise();

// Handle promise's fulfilled/rejected states
getTopicAttribsPromise.then(
  function(data) {
    console.log(data);
  }).catch(
  function(err) {
    console.error(err, err.stack);
});
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [GetTopicAttributes](#) in *AWS SDK for JavaScript API Reference*.

## JavaScript

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { SNSClient } from "@aws-sdk/client-sns";  
// Set the AWS Region.  
const REGION = "REGION"; //e.g. "us-east-1"  
// Create SNS service object.  
const snsClient = new SNSClient({ region: REGION });  
export { snsClient };
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js  
import {ListTopicsCommand} from "@aws-sdk/client-sns";  
import {snsClient} from "./libs/snsClient.js";  
  
const run = async () => {  
    try {  
        const data = await snsClient.send(new ListTopicsCommand({}));  
        console.log("Success.", data);  
        return data; // For unit tests.  
    } catch (err) {  
        console.log("Error", err.stack);  
    }  
};
```

```
run();
```

## Publish an Amazon SNS SMS text message using an AWS SDK

The following code examples show how to publish SMS messages using Amazon SNS.

### .NET

#### AWS SDK for .NET

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using Amazon;  
using Amazon.SimpleNotificationService;  
using Amazon.SimpleNotificationService.Model;  
using System;  
using System.Threading.Tasks;  
  
namespace SNSMessageExample  
{  
    class SNSMessage  
    {  
        private AmazonSimpleNotificationServiceClient snsClient;  
  
        /// <summary>  
        /// Constructs a new SNSMessage object initializing the Amazon Simple  
        /// Notification Service (Amazon SNS) client using the supplied  
        /// Region endpoint.  
        /// </summary>  
        /// <param name="regionEndpoint">The Amazon Region endpoint to use in  
        /// sending test messages with this object.</param>  
        public SNSMessage(RegionEndpoint regionEndpoint)  
        {  
            snsClient = new AmazonSimpleNotificationServiceClient(regionEndpoint);  
        }  
  
        /// <summary>  
        /// Sends the SMS message passed in the text parameter to the phone number  
        /// in phoneNum.  
        /// </summary>  
        /// <param name="phoneNum">The ten-digit phone number to which the text  
        /// message will be sent.</param>  
        /// <param name="text">The text of the message to send.</param>
```

```
/// <returns></returns>
public async Task SendTextMessageAsync(string phoneNum, string text)
{
    if (string.IsNullOrEmpty(phoneNum) || string.IsNullOrEmpty(text))
    {
        return;
    }

    // Now actually send the message.
    var request = new PublishRequest
    {
        Message = text,
        PhoneNumber = phoneNum
    };

    try
    {
        var response = await snsClient.PublishAsync(request);
    }
    catch (Exception ex)
    {
        Console.WriteLine($"Error sending message: {ex}");
    }
}

}
```

```
/**
 * Publish SMS: use Amazon SNS to send an SMS text message to a phone number.
 * Note: This requires additional AWS configuration prior to running example.
 *
 * NOTE: When you start using Amazon SNS to send SMS messages, your AWS account is
 * in the SMS sandbox and you can only
 * use verified destination phone numbers. See https://docs.aws.amazon.com/sns/latest/dg/sns-sms-sandbox.html.
 * NOTE: If destination is in the US, you also have an additional restriction that
 * you have use a dedicated
 * origination ID (phone number). You can request an origination number using
 * Amazon Pinpoint for a fee.
 * See https://aws.amazon.com/blogs/compute/provisioning-and-using-10dlc-origination-numbers-with-amazon-sns/
 * for more information.
 *
 * <phone_number_value> input parameter uses E.164 format.
 * For example, in United States, this input value should be of the form:
 +12223334444
 */
int main(int argc, char ** argv)
{
    if (argc != 3)
    {
```

```
    std::cout << "Usage: publish_sms <message_value> <phone_number_value> " <<
    std::endl;
    return 1;
}

Aws::SDKOptions options;
Aws::InitAPI(options);

```
public class RegistrationExample {  
  
    public static void main(String[] args) {  
  
        final String usage = "\n" +  
            "Usage: " +
```

```
"      <token>\n\n" +
"Where:\n" +
"  token - The name of the FIFO topic. \n\n" +
"  platformApplicationArn - The ARN value of platform application. You
can get this value from the AWS Management Console. \n\n";
if (args.length != 2) {
    System.out.println(usage);
    System.exit(1);
}

String token = args[0];
String platformApplicationArn = args[1];
SnsClient snsClient = SnsClient.builder()
    .region(Region.US_EAST_1)
    .credentialsProvider(ProfileCredentialsProvider.create())
    .build();

createEndpoint(snsClient, token, platformApplicationArn);
}

public static void createEndpoint(SnsClient snsClient, String token, String
platformApplicationArn){

    System.out.println("Creating platform endpoint with token " + token);

    try {
        CreatePlatformEndpointRequest endpointRequest =
CreatePlatformEndpointRequest.builder()
        .token(token)
        .platformApplicationArn(platformApplicationArn)
        .build();

        CreatePlatformEndpointResponse response =
snsClient.createPlatformEndpoint(endpointRequest);
        System.out.println("The ARN of the endpoint is " +
response.endpointArn());
    } catch ( SnsException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
}
```

## Create and publish to a FIFO Amazon SNS topic using an AWS SDK

The following code examples show how to create and publish to a FIFO Amazon SNS topic.

Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a FIFO topic and FIFO queues. Subscribe the queues to the topic.

```
public static void main(String[] args) {
```

```
final String usage = "\n" +
    "Usage: " +
    "    <topicArn>\n\n" +
    "Where:\n" +
    "    fifoTopicName - The name of the FIFO topic. \n\n" +
    "    fifoQueueARN - The ARN value of a SQS FIFO queue. You can get this
value from the AWS Management Console. \n\n";

if (args.length != 2) {
    System.out.println(usage);
    System.exit(1);
}

String fifoTopicName = "PriceUpdatesTopic3 fifo";
String fifoQueueARN = "arn:aws:sqs:us-east-1:814548047983:MyPriceSQS fifo";
SnsClient snsClient = SnsClient.builder()
    .region(Region.US_EAST_1)
    .credentialsProvider(ProfileCredentialsProvider.create())
    .build();

createFIFO(snsClient, fifoTopicName, fifoQueueARN);
}

public static void createFIFO(SnsClient snsClient, String topicName, String
queueARN) {

    try {
        // Create a FIFO topic by using the SNS service client.
        Map<String, String> topicAttributes = new HashMap<>();
        topicAttributes.put("FifoTopic", "true");
        topicAttributes.put("ContentBasedDeduplication", "false");

        CreateTopicRequest topicRequest = CreateTopicRequest.builder()
            .name(topicName)
            .attributes(topicAttributes)
            .build();

        CreateTopicResponse response = snsClient.createTopic(topicRequest);
        String topicArn = response.topicArn();
        System.out.println("The topic ARN is"+topicArn);

        // Subscribe to the endpoint by using the SNS service client.
        // Only Amazon SQS FIFO queues can receive notifications from an Amazon
SNS FIFO topic.
        SubscribeRequest subscribeRequest = SubscribeRequest.builder()
            .topicArn(topicArn)
            .endpoint(queueARN)
            .protocol("sqS")
            .build();

        snsClient.subscribe(subscribeRequest);
        System.out.println("The topic is subscribed to the queue.");

        // Compose and publish a message that updates the wholesale price.
        String subject = "Price Update";
        String payload = "{\"product\": 214, \"price\": 79.99}";
        String groupId = "PID-214";
        String dedupId = UUID.randomUUID().toString();
        String attributeName = "business";
        String attributeValue = "wholesale";

        MessageAttributeValue msgAttValue = MessageAttributeValue.builder()
            .dataType("String")
            .stringValue(attributeValue)
            .build();
    }
}
```

```
Map<String, MessageAttributeValue> attributes = new HashMap<>();
attributes.put(attributeName, msgAttValue);
PublishRequest pubRequest = PublishRequest.builder()
    .topicArn(topicArn)
    .subject(subject)
    .message(payload)
    .messageGroupId(groupId)
    .messageDuplicationId(dedupId)
    .messageAttributes(attributes)
    .build();

snsClient.publish(pubRequest);
System.out.println("Message was published to "+topicArn);

} catch (SnsException e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}
}
```

## SAP ABAP

### SDK for SAP ABAP

#### Note

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```

## Publish SMS messages to an Amazon SNS topic using an AWS SDK

The following code example shows how to:

- Create an Amazon SNS topic.
- Subscribe phone numbers to the topic.
- Publish SMS messages to the topic so that all subscribed phone numbers receive the message at once.

Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a topic and return its ARN.

```
public static String createSNSTopic(SnsClient snsClient, String topicName ) {  
  
    CreateTopicResponse result = null;  
    try {  
        CreateTopicRequest request = CreateTopicRequest.builder()  
            .name(topicName)  
            .build();  
  
        result = snsClient.createTopic(request);  
        return result.topicArn();  
  
    } catch (SnsException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
    return "";  
}
```

Subscribe an endpoint to a topic.

```
public static void subTextSNS( SnsClient snsClient, String topicArn, String  
phoneNumber) {  
  
    try {  
        SubscribeRequest request = SubscribeRequest.builder()  
            .protocol("sms")  
            .endpoint(phoneNumber)  
            .returnSubscriptionArn(true)  
            .topicArn(topicArn)  
            .build();  
  
        SubscribeResponse result = snsClient.subscribe(request);  
        System.out.println("Subscription ARN: " + result.subscriptionArn() +  
"\n\n Status is " + result.sdkHttpResponse().statusCode());  
  
    } catch (SnsException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
}
```

Set attributes on the message, such as the ID of the sender, the maximum price, and its type.  
Message attributes are optional.

```
public class SetSMSAttributes {  
    public static void main(String[] args) {  
  
        HashMap<String, String> attributes = new HashMap<>(1);  
        attributes.put("DefaultSMSType", "Transactional");  
        attributes.put("UsageReportS3Bucket", "janbucket" );  
  
        SnsClient snsClient = SnsClient.builder()  
            .region(Region.US_EAST_1)  
            .credentialsProvider(ProfileCredentialsProvider.create())  
            .build();  
        setSNSAttributes(snsClient, attributes);  
        snsClient.close();  
    }  
}
```

```
public static void setSNSAttributes( SnsClient snsClient, HashMap<String, String> attributes) {  
  
    try {  
        SetSmsAttributesRequest request = SetSmsAttributesRequest.builder()  
            .attributes(attributes)  
            .build();  
  
        SetSmsAttributesResponse result = snsClient.setSMSAttributes(request);  
        System.out.println("Set default Attributes to " + attributes + ".  
Status was " + result.sdkHttpResponse().statusCode());  
  
    } catch (SnsException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
}
```

Publish a message to a topic. The message is sent to every subscriber.

```
public static void pubTextSMS(SnsClient snsClient, String message, String phoneNumber) {  
    try {  
        PublishRequest request = PublishRequest.builder()  
            .message(message)  
            .phoneNumber(phoneNumber)  
            .build();  
  
        PublishResponse result = snsClient.publish(request);  
        System.out.println(result.messageId() + " Message sent. Status was " +  
result.sdkHttpResponse().statusCode());  
  
    } catch (SnsException e) {  
        System.err.println(e.awsErrorDetails().errorMessage());  
        System.exit(1);  
    }  
}
```

## Publish a large message to Amazon SNS with Amazon S3 using an AWS SDK

The following code example shows how to publish a large message to Amazon SNS using Amazon S3 to store the message payload.

Java

### SDK for Java 1.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

To publish a large message, use the Amazon SNS Extended Client Library for Java. The message that you send references an Amazon S3 object containing the actual message content.

```
import com.amazonaws.sqs.javamessaging.AmazonSQSExtendedClient;  
import com.amazonaws.sqs.javamessaging.ExtendedClientConfiguration;
```

```
import com.amazonaws.regions.Region;
import com.amazonaws.regions.Regions;
import com.amazonaws.services.s3.AmazonS3;
import com.amazonaws.services.s3.AmazonS3ClientBuilder;
import com.amazonaws.services.sns.AmazonSNS;
import com.amazonaws.services.sns.AmazonSNSClientBuilder;
import com.amazonaws.services.sns.model.CreateTopicRequest;
import com.amazonaws.services.sns.model.PublishRequest;
import com.amazonaws.services.sns.model.SetSubscriptionAttributesRequest;
import com.amazonaws.services.sns.util.Topics;
import com.amazonaws.services.sqs.AmazonSQS;
import com.amazonaws.services.sqs.AmazonSQSClientBuilder;
import com.amazonaws.services.sqs.model.CreateQueueRequest;
import com.amazonaws.services.sqs.model.ReceiveMessageResult;
import software.amazon sns AmazonSNSExtendedClient;
import software.amazon sns SNSExtendedClientConfiguration;

public class Example {

    public static void main(String[] args) {
        final String BUCKET_NAME = "extended-client-bucket";
        final String TOPIC_NAME = "extended-client-topic";
        final String QUEUE_NAME = "extended-client-queue";
        final Regions region = Regions.DEFAULT_REGION;

        //Message threshold controls the maximum message size that will be allowed
        to be published
        //through SNS using the extended client. Payload of messages exceeding this
        value will be stored in
        //S3. The default value of this parameter is 256 KB which is the maximum
        message size in SNS (and SQS).
        final int EXTENDED_STORAGE_MESSAGE_SIZE_THRESHOLD = 32;

        //Initialize SNS, SQS and S3 clients
        final AmazonSNS snsClient =

            new CreateQueueRequest().withQueueName(QUEUE_NAME)
        ).getQueueUrl();
        final String subscriptionArn = Topics.subscribeQueue(
            snsClient, sqsClient, topicArn, queueUrl
        );

        //To read message content stored in S3 transparently through SQS extended
        client,
        //set the RawMessageDelivery subscription attribute to TRUE
        final SetSubscriptionAttributesRequest subscriptionAttributesRequest = new
SetSubscriptionAttributesRequest();
        subscriptionAttributesRequest.setSubscriptionArn(subscriptionArn);
        subscriptionAttributesRequest.setAttributeName("RawMessageDelivery");
        subscriptionAttributesRequest.setAttributeValue("TRUE");
        snsClient.setSubscriptionAttributes(subscriptionAttributesRequest);

        //Initialize SNS extended client
        //PayloadSizeThreshold triggers message content storage in S3 when the
        threshold is exceeded
    }
}
```

```
//To store all messages content in S3, use AlwaysThroughS3 flag
final SNSExtendedClientConfiguration snsExtendedClientConfiguration = new
SNSExtendedClientConfiguration()
    .withPayloadSupportEnabled(s3Client, BUCKET_NAME)
    .withPayloadSizeThreshold(EXTENDED_STORAGE_MESSAGE_SIZE_THRESHOLD);
final AmazonSNSExtendedClient snsExtendedClient = new
AmazonSNSExtendedClient(snsClient, snsExtendedClientConfiguration);

//Publish message via SNS with storage in S3
final String message = "This message is stored in S3 as it exceeds the
threshold of 32 bytes set above.";
snsExtendedClient.publish(topicArn, message);

//Initialize SQS extended client
final ExtendedClientConfiguration sqsExtendedClientConfiguration = new
ExtendedClientConfiguration()
    .withPayloadSupportEnabled(s3Client, BUCKET_NAME);
final AmazonSQSExtendedClient sqsExtendedClient =
    new AmazonSQSExtendedClient(sqsClient,
sqsExtendedClientConfiguration);

//Read the message from the queue
final ReceiveMessageResult result =
sqsExtendedClient.receiveMessage(queueUrl);
System.out.println("Received message is " +
result.getMessages().get(0).getBody());
}
}
```

## Cross-service examples for Amazon SNS using AWS SDKs

The following code examples show how to use Amazon Simple Notification Service with AWS SDKs. Each example contains a sample application that works across multiple AWS services.

### Examples

- [Build an application to submit data to a DynamoDB table \(p. 2015\)](#)
- [Build a publish and subscription application that translates messages \(p. 2016\)](#)
- [Create an Amazon Textract explorer application \(p. 2017\)](#)
- [Detect people and objects in a video with Amazon Rekognition using an AWS SDK \(p. 2018\)](#)
- [Use API Gateway to invoke a Lambda function \(p. 2019\)](#)
- [Use scheduled events to invoke a Lambda function \(p. 2020\)](#)

## Build an application to submit data to a DynamoDB table

The following code examples show how to build an application that submits data to an Amazon DynamoDB table and notifies you when a user updates the table.

Java

### SDK for Java 2.x

Shows how to create a dynamic web application that submits data using the Amazon DynamoDB Java API and sends a text message using the Amazon Simple Notification Service Java API.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- DynamoDB
- Amazon SNS

JavaScript

#### SDK for JavaScript V3

This example shows how to build an app that enables users to submit data to an Amazon DynamoDB table, and send a text message to the administrator using Amazon Simple Notification Service (Amazon SNS).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

This example is also available in the [AWS SDK for JavaScript v3 developer guide](#).

### Services used in this example

- DynamoDB
- Amazon SNS

Kotlin

#### SDK for Kotlin

##### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

Shows how to create a native Android application that submits data using the Amazon DynamoDB Kotlin API and sends a text message using the Amazon SNS Kotlin API.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- DynamoDB
- Amazon SNS

## Build a publish and subscription application that translates messages

The following code examples show how to create an application that has subscription and publish functionality and translates messages.

.NET

#### AWS SDK for .NET

Shows how to use the Amazon Simple Notification Service .NET API to create a web application that has subscription and publish functionality. In addition, this example application also translates messages.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon SNS
- Amazon Translate

Java

#### SDK for Java 2.x

Shows how to use the Amazon Simple Notification Service Java API to create a web application that has subscription and publish functionality. In addition, this example application also translates messages.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

For complete source code and instructions on how to set up and run the example that uses the Java Async API, see the full example on [GitHub](#).

#### Services used in this example

- Amazon SNS
- Amazon Translate

Kotlin

#### SDK for Kotlin

##### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

Shows how to use the Amazon SNS Kotlin API to create an application that has subscription and publish functionality. In addition, this example application also translates messages.

For complete source code and instructions on how to create a web app, see the full example on [GitHub](#).

For complete source code and instructions on how to create a native Android app, see the full example on [GitHub](#).

#### Services used in this example

- Amazon SNS
- Amazon Translate

## Create an Amazon Textract explorer application

The following code examples show how to explore Amazon Textract output through an interactive application.

JavaScript

#### SDK for JavaScript V3

Shows how to use the AWS SDK for JavaScript to build a React application that uses Amazon Textract to extract data from a document image and display it in an interactive web page.

This example runs in a web browser and requires an authenticated Amazon Cognito identity for credentials. It uses Amazon Simple Storage Service (Amazon S3) for storage, and for notifications it polls an Amazon Simple Queue Service (Amazon SQS) queue that is subscribed to an Amazon Simple Notification Service (Amazon SNS) topic.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Cognito Identity
- Amazon S3
- Amazon SNS
- Amazon SQS
- Amazon Textract

Python

#### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) with Amazon Textract to detect text, form, and table elements in a document image. The input image and Amazon Textract output are shown in a Tkinter application that lets you explore the detected elements.

- Submit a document image to Amazon Textract and explore the output of detected elements.
- Submit images directly to Amazon Textract or through an Amazon Simple Storage Service (Amazon S3) bucket.
- Use asynchronous APIs to start a job that publishes a notification to an Amazon Simple Notification Service (Amazon SNS) topic when the job completes.
- Poll an Amazon Simple Queue Service (Amazon SQS) queue for a job completion message and display the results.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon S3
- Amazon SNS
- Amazon SQS
- Amazon Textract

## Detect people and objects in a video with Amazon Rekognition using an AWS SDK

The following code examples show how to detect people and objects in a video with Amazon Rekognition.

Python

#### SDK for Python (Boto3)

Use Amazon Rekognition to detect faces, objects, and people in videos by starting asynchronous detection jobs. This example also configures Amazon Rekognition to notify an Amazon Simple Notification Service (Amazon SNS) topic when jobs complete and subscribes an Amazon Simple

Queue Service (Amazon SQS) queue to the topic. When the queue receives a message about a job, the job is retrieved and the results are output.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Rekognition
- Amazon SNS
- Amazon SQS

## Use API Gateway to invoke a Lambda function

The following code examples show how to create an AWS Lambda function invoked by Amazon API Gateway.

Java

### SDK for Java 2.x

Shows how to create an AWS Lambda function by using the Lambda Java runtime API. This example invokes different AWS services to perform a specific use case. This example demonstrates how to create a Lambda function invoked by Amazon API Gateway that scans an Amazon DynamoDB table for work anniversaries and uses Amazon Simple Notification Service (Amazon SNS) to send a text message to your employees that congratulates them at their one year anniversary date.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- API Gateway
- DynamoDB
- Lambda
- Amazon SNS

JavaScript

### SDK for JavaScript V3

Shows how to create an AWS Lambda function by using the Lambda JavaScript runtime API. This example invokes different AWS services to perform a specific use case. This example demonstrates how to create a Lambda function invoked by Amazon API Gateway that scans an Amazon DynamoDB table for work anniversaries and uses Amazon Simple Notification Service (Amazon SNS) to send a text message to your employees that congratulates them at their one year anniversary date.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

This example is also available in the [AWS SDK for JavaScript v3 developer guide](#).

### Services used in this example

- API Gateway
- DynamoDB

- Lambda
- Amazon SNS

## Use scheduled events to invoke a Lambda function

The following code examples show how to create an AWS Lambda function invoked by an Amazon EventBridge scheduled event.

Java

### SDK for Java 2.x

Shows how to create an Amazon EventBridge scheduled event that invokes an AWS Lambda function. Configure EventBridge to use a cron expression to schedule when the Lambda function is invoked. In this example, you create a Lambda function by using the Lambda Java runtime API. This example invokes different AWS services to perform a specific use case. This example demonstrates how to create an app that sends a mobile text message to your employees that congratulates them at the one year anniversary date.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- DynamoDB
- EventBridge
- Lambda
- Amazon SNS

## Code examples for Amazon SQS using AWS SDKs

The following code examples show how to use Amazon Simple Queue Service with an AWS software development kit (SDK).

## Code examples

- [Actions for Amazon SQS using AWS SDKs \(p. 2021\)](#)
  - [Authorize an Amazon S3 bucket to send messages to an Amazon SQS queue \(p. 2022\)](#)
  - [Change how long an Amazon SQS queue waits for a message \(p. 2022\)](#)
  - [Receive an Amazon SQS message and change its timeout visibility \(p. 2024\)](#)
  - [Create an Amazon SQS queue using an AWS SDK \(p. 2028\)](#)
  - [Delete a batch of messages from an Amazon SQS queue using an AWS SDK \(p. 2039\)](#)
  - [Delete a message from an Amazon SQS queue using an AWS SDK \(p. 2040\)](#)
  - [Delete an Amazon SQS queue using an AWS SDK \(p. 2047\)](#)
  - [Get attributes for an Amazon SQS queue \(p. 2053\)](#)
  - [Get the URL of an Amazon SQS queue using an AWS SDK \(p. 2054\)](#)
  - [List Amazon SQS queues using an AWS SDK \(p. 2059\)](#)
  - [Receive messages from an Amazon SQS queue using an AWS SDK \(p. 2063\)](#)
  - [Send a batch of messages to an Amazon SQS queue using an AWS SDK \(p. 2072\)](#)
  - [Send a message to an Amazon SQS queue using an AWS SDK \(p. 2074\)](#)
- [Scenarios for Amazon SQS using AWS SDKs \(p. 2084\)](#)
  - [Send and receive batches of messages with Amazon SQS using an AWS SDK \(p. 2084\)](#)
- [Cross-service examples for Amazon SQS using AWS SDKs \(p. 2087\)](#)
  - [Create a web application that sends and retrieves messages by using the Amazon Simple Queue Service API \(p. 2087\)](#)
  - [Create a messenger application with Step Functions \(p. 2088\)](#)
  - [Create an Amazon Textract explorer application \(p. 2089\)](#)
  - [Detect people and objects in a video with Amazon Rekognition using an AWS SDK \(p. 2090\)](#)

## Actions for Amazon SQS using AWS SDKs

The following code examples show how to use Amazon Simple Queue Service with AWS SDKs. Each example calls an individual service function.

### Examples

- [Authorize an Amazon S3 bucket to send messages to an Amazon SQS queue \(p. 2022\)](#)
- [Change how long an Amazon SQS queue waits for a message \(p. 2022\)](#)
- [Receive an Amazon SQS message and change its timeout visibility \(p. 2024\)](#)
- [Create an Amazon SQS queue using an AWS SDK \(p. 2028\)](#)
- [Delete a batch of messages from an Amazon SQS queue using an AWS SDK \(p. 2039\)](#)
- [Delete a message from an Amazon SQS queue using an AWS SDK \(p. 2040\)](#)
- [Delete an Amazon SQS queue using an AWS SDK \(p. 2047\)](#)
- [Get attributes for an Amazon SQS queue \(p. 2053\)](#)
- [Get the URL of an Amazon SQS queue using an AWS SDK \(p. 2054\)](#)
- [List Amazon SQS queues using an AWS SDK \(p. 2059\)](#)
- [Receive messages from an Amazon SQS queue using an AWS SDK \(p. 2063\)](#)
- [Send a batch of messages to an Amazon SQS queue using an AWS SDK \(p. 2072\)](#)
- [Send a message to an Amazon SQS queue using an AWS SDK \(p. 2074\)](#)

## Authorize an Amazon S3 bucket to send messages to an Amazon SQS queue

The following code example shows how to authorize an Amazon S3 bucket to send messages to an Amazon SQS queue.

.NET

### AWS SDK for .NET

#### Note

```
using System;
using System.Threading.Tasks;
using Amazon.SQS;

public class AuthorizeS3ToSendMessage
{
    /// <summary>
    /// Initializes the Amazon SQS client object and then calls the
    /// AuthorizeS3ToSendMessageAsync method to authorize the named
    /// bucket to send messages in response to S3 events.
    /// </summary>
    public static async Task Main()
    {
        string queueUrl = "https://sqs.us-east-2.amazonaws.com/0123456789ab/
Example_Queue";
        string bucketName = "doc-example-bucket";

        // Create an Amazon SQS client object using the
        // default user. If the AWS Region you want to use
        // is different, supply the AWS Region as a parameter.
        IAmazonSQS client = new AmazonSQSClient();

        var queueARN = await client.AuthorizeS3ToSendMessageAsync(queueUrl,
bucketName);

        if (!string.IsNullOrEmpty(queueARN))
        {
            Console.WriteLine($"The Amazon S3 bucket: {bucketName} has been
successfully authorized.");
            Console.WriteLine($"{bucketName} can now send messages to the queue
with ARN: {queueARN}.");
        }
    }
}
```

## Change how long an Amazon SQS queue waits for a message

The following code example shows how to change how long an Amazon SQS queue waits for a message to arrive.

## JavaScript

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { SQSClient } from "@aws-sdk/client-sqs";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SQS service object.
const sqsClient = new SQSClient({ region: REGION });
export { sqsClient };
```

Change how long an Amazon SQS queue waits for a message to arrive.

```
// Import required AWS SDK clients and commands for Node.js
import { SetQueueAttributesCommand } from "@aws-sdk/client-sqs";
import { sqsClient } from "./libs/sqsClient.js";

// Set the parameters
const params = {
  Attributes: {
    ReceiveMessageWaitTimeSeconds: "20",
  },
  QueueUrl: "SQS_QUEUE_URL", //SQS_QUEUE_URL; e.g., 'https://
  sqs.REGION.amazonaws.com/ACCOUNT-ID/QUEUE-NAME'
};

const run = async () => {
  try {
    const data = await sqsClient.send(new SetQueueAttributesCommand(params));
    console.log("Success", data);
    return data; // For unit tests.
  } catch (err) {
    console.error(err, err.stack);
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [SetQueueAttributes](#) in [AWS SDK for JavaScript API Reference](#).

### SDK for JavaScript V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Change how long an Amazon SQS queue waits for a message to arrive.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create the SQS service object
```

```
var sqs = new AWS.SQS({apiVersion: '2012-11-05'});

var params = {
  Attributes: [
    "ReceiveMessageWaitTimeSeconds": "20",
  ],
  QueueUrl: "SQS_QUEUE_URL"
};

sqs.setQueueAttributes(params, function(err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data);
  }
});
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).

Create the client.

```
import { SQSClient } from "@aws-sdk/client-sqs";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SQS service object.
const sqsClient = new SQSClient({ region: REGION });
export { sqsClient };
```

Receive an Amazon SQS message and change its timeout visibility.

```
// Import required AWS SDK clients and commands for Node.js
import {
  ReceiveMessageCommand,
  ChangeMessageVisibilityCommand,
} from "@aws-sdk/client-sqs";
import { sqsClient } from "./libs/sqsClient.js";

// Set the parameters
const queueURL = "https://sqs.REGION.amazonaws.com/ACCOUNT-ID/QUEUE-NAME"; //
REGION, ACCOUNT_ID, QUEUE_NAME
const params = {
  AttributeNames: ["SentTimestamp"],
  MaxNumberOfMessages: 1,
  MessageAttributeNames: ["All"],
  QueueUrl: queueURL,
```

```
};

const run = async () => {
  try {
    const data = await sqsClient.send(new ReceiveMessageCommand(params));
    if (data.Messages != null) {
      try {
        const visibilityParams = {
          QueueUrl: queueURL,
          ReceiptHandle: data.Messages[0].ReceiptHandle,
          VisibilityTimeout: 20, // 20 second timeout
        };
        const results = await sqsClient.send(
          new ChangeMessageVisibilityCommand(visibilityParams)
        );
        console.log("Timeout Changed", results);
      } catch (err) {
        console.log("Delete Error", err);
      }
    } else {
      console.log("No messages to change");
    }
    return data; // For unit tests.
  } catch (err) {
    console.log("Receive Error", err);
  }
};
run();
```

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Receive an Amazon SQS message and change its timeout visibility.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk')
// Set the region to us-west-2
AWS.config.update({ region: 'us-west-2' })

// Create the SQS service object
var sqs = new AWS.SQS({ apiVersion: '2012-11-05' })

var queueURL = 'https://sqs.REGION.amazonaws.com/ACCOUNT-ID/QUEUE-NAME'

var params = {
  AttributeNames: ['SentTimestamp'],
  MaxNumberOfMessages: 1,
  MessageAttributeNames: ['All'],
  QueueUrl: queueURL
}

sqs.receiveMessage(params, function (err, data) {
  if (err) {
    console.log('Receive Error', err)
  } else {
    // Make sure we have a message
    if (data.Messages != null) {
```

```
var visibilityParams = {
  QueueUrl: queueURL,
  ReceiptHandle: data.Messages[0].ReceiptHandle,
  VisibilityTimeout: 20 // 20 second timeout
}
sqS.changeMessageVisibility(visibilityParams, function (err, data) {
  if (err) {
    console.log('Delete Error', err)
  } else {
    console.log('Timeout Changed', data)
  }
})
} else {
  console.log('No messages to change')
}
})
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).

## Create an Amazon SQS queue using an AWS SDK

The following code examples show how to create an Amazon SQS queue.

.NET

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.Collections.Generic;
using System.Threading.Tasks;
using Amazon.SQS;
using Amazon.SQS.Model;

public class CreateQueue
{
  /// <summary>
  /// Initializes the Amazon SQS client object and then calls the
  /// CreateQueueAsync method to create the new queue. If the call is
  /// successful, it displays the URL of the new queue on the console.
  /// </summary>
  public static async Task Main()
  {
    // If the Amazon SQS message queue is not in the same AWS Region as
    // your default user, you need to provide the AWS Region as a parameter to
    // the client constructor.
    var client = new AmazonSQSClient();

    string queueName = "New-Example-Queue";
    int maxMessage = 256 * 1024;
    var attrs = new Dictionary<string, string>
    {
      {
```

```
        QueueAttributeName.DelaySeconds,
        TimeSpan.FromSeconds(5).TotalSeconds.ToString()
    },
    {
        QueueAttributeName.MaximumMessageSize,
        maxMessage.ToString()
    },
    {
        QueueAttributeName.MessageRetentionPeriod,
        TimeSpan.FromDays(4).TotalSeconds.ToString()
    },
    {
        QueueAttributeName.ReceiveMessageWaitTimeSeconds,
        TimeSpan.FromSeconds(5).TotalSeconds.ToString()
    },
    {
        QueueAttributeName.VisibilityTimeout,
        TimeSpan.FromHours(12).TotalSeconds.ToString()
    },
};

var request = new CreateQueueRequest
{
    Attributes = attrs,
    QueueName = queueName,
};

var response = await client.CreateQueueAsync(request);

if (response.HttpStatusCode == System.Net.HttpStatusCode.OK)
{
    Console.WriteLine("Successfully created Amazon SQS queue.");
    Console.WriteLine($"Queue URL: {response.QueueUrl}");
}
}
```

Create an Amazon SQS queue and send a message to it.

```

Create the client.

```
import { SQSClient } from "@aws-sdk/client-sqs";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SQS service object.
const sqsClient = new SQSClient({ region: REGION });
export { sqsClient };
```

Create an Amazon SQS standard queue.

```
// Import required AWS SDK clients and commands for Node.js
import { CreateQueueCommand } from "@aws-sdk/client-sqs";
import { sqsClient } from "./libs/sqsClient.js";

// Set the parameters
const params = {
  QueueName: "SQS_QUEUE_NAME", //SQS_QUEUE_URL
  Attributes: {
    DelaySeconds: "60", // Number of seconds delay.
    MessageRetentionPeriod: "86400", // Number of seconds delay.
  },
};

const run = async () => {
  try {
    const data = await sqsClient.send(new CreateQueueCommand(params));
    console.log("Success", data);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

Create an Amazon SQS queue that waits for a message to arrive.

```
// Import required AWS SDK clients and commands for Node.js
import { CreateQueueCommand } from "@aws-sdk/client-sqs";
import { sqsClient } from "./libs/sqsClient.js";

// Set the parameters
const params = {
  QueueName: "SQS_QUEUE_NAME", //SQS_QUEUE_URL; e.g., 'https://
  sqs.REGION.amazonaws.com/ACCOUNT-ID/QUEUE-NAME'
  Attributes: {
    ReceiveMessageWaitTimeSeconds: "20",
```

```
        },
    };

const run = async () => {
    try {
        const data = await sqsClient.send(new CreateQueueCommand(params));
        console.log("Success", data);
        return data; // For unit tests.
    } catch (err) {
        console.error(err, err.stack);
    }
};

run();

List your Amazon SQS queues.

```
package main  
  
import (  
    "context"  
    "fmt"  
  
    "github.com/aws/aws-sdk-go-v2/config"  
    "github.com/aws/aws-sdk-go-v2/service/sqs"  
)  
  
// SQSListQueuesAPI defines the interface for the ListQueues function.  
// We use this interface to test the function using a mocked service.  
type SQSListQueuesAPI interface {  
    ListQueues(ctx context.Context,  
        params *sqs.ListQueuesInput,  
        optFns ...func(*sqs.Options)) (*sqs.ListQueuesOutput, error)  
}  
  
// GetQueues retrieves a list of your Amazon Simple Queue Service (Amazon SQS)  
// queues.  
// Inputs:  
//     c is the context of the method call, which includes the AWS Region.  
//     api is the interface that defines the method call.
```

```
//      input defines the input arguments to the service call.
// Output:
//      If success, a ListQueuesOutput object containing the result of the service
//      call and nil.
//      Otherwise, nil and an error from the call to ListQueues.
func GetQueues(c context.Context, api SQSListQueuesAPI, input *sqrs.ListQueuesInput)
(*sqrs.ListQueuesOutput, error) {
    return api.ListQueues(c, input)
}

func main() {
    cfg, err := config.LoadDefaultConfig(context.TODO())
    if err != nil {
        panic("configuration error, " + err.Error())
    }

    client := sqs.NewFromConfig(cfg)

    input := &sqrs.ListQueuesInput{}

    result, err := GetQueues(context.TODO(), client, input)
    if err != nil {
        fmt.Println("Got an error retrieving queue URLs:")
        fmt.Println(err)
        return
    }

    for i, url := range result.QueueUrls {
        fmt.Printf("%d: %s\n", i+1, url)
    }
}
```

## Receive messages from an Amazon SQS queue using an AWS SDK

The following code examples show how to receive messages from an Amazon SQS queue.

.NET

## AWS SDK for .NET

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.Collections.Generic;
using System.Threading.Tasks;
using Amazon.SQS;
using Amazon.SQS.Model;

public class ReceiveFromQueue
{
    public static async Task Main(string[] args)
    {
        string queueUrl = "https://sqs.us-east-2.amazonaws.com/0123456789ab/
Example_Queue";
        var attributeNames = new List<string>() { "All" };
        int maxNumberOfMessages = 5;
        var visibilityTimeout = (int)TimeSpan.FromMinutes(10).TotalSeconds;
        var waitTimeSeconds = (int)TimeSpan.FromSeconds(5).TotalSeconds;

        // If the Amazon SQS message queue is not in the same AWS Region as
your
        // default user, you need to provide the AWS Region as a parameter to
the
        // client constructor.
        var client = new AmazonSQSClient();

        var request = new ReceiveMessageRequest
        {
            QueueUrl = queueUrl,
            AttributeNames = attributeNames,
            MaxNumberOfMessages = maxNumberOfMessages,
            VisibilityTimeout = visibilityTimeout,
            WaitTimeSeconds = waitTimeSeconds,
        };

        var response = await client.ReceiveMessageAsync(request);

        if (response.Messages.Count > 0)
        {
            DisplayMessages(response.Messages);
        }
    }

    /// <summary>
    /// Display message information for a list of Amazon SQS messages.
    /// </summary>
    /// <param name="messages">The list of Amazon SQS Message objects to
display.</param>
    public static void DisplayMessages(List<Message> messages)
    {
        messages.ForEach(m =>
        {
            Console.WriteLine($"For message ID {m.MessageId}:");
            Console.WriteLine($" Body: {m.Body}");
            Console.WriteLine($" Receipt handle: {m.ReceiptHandle}");
            Console.WriteLine($" MD5 of body: {m.MD5OfBody}");
            Console.WriteLine($" MD5 of message attributes:
{m.MD5OfMessageAttributes}");
        });
    }
}
```

```
        Console.WriteLine("  Attributes:");
        foreach (var attr in m.Attributes)
        {
            Console.WriteLine($"    \t {attr.Key}: {attr.Value}");
        }
    });
}
```

Receive a message from an Amazon SQS queue, and then delete the message.

```

public static async Task Main()
{
    // If the AWS Region you want to use is different from
    // the AWS Region defined for the default user, supply
    // the specify your AWS Region to the client constructor.
    var client = new AmazonSQSClient();
    string queueName = "Example_Queue";

    var queueUrl = await GetQueueUrl(client, queueName);
    Console.WriteLine($"The SQS queue's URL is {queueUrl}");

    var response = await ReceiveAndDeleteMessage(client, queueUrl);

    Console.WriteLine($"Message: {response.Messages[0]}");
}

/// <summary>
/// Retrieve the queue URL for the queue named in the queueName
/// property using the client object.
/// </summary>
/// <param name="client">The Amazon SQS client used to retrieve the
/// queue URL.</param>

## JavaScript

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { SQSClient } from "@aws-sdk/client-sqs";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SQS service object.
const sqsClient = new SQSClient({ region: REGION });
export { sqsClient };
```

Receive a message from an Amazon SQS queue using long-poll support.

```
// Import required AWS SDK clients and commands for Node.js
import { ReceiveMessageCommand } from "@aws-sdk/client-sqs";
import { sqsClient } from "./libs/sqsClient.js";

// Set the parameters
const queueURL = "SQS_QUEUE_URL"; // SQS_QUEUE_URL
const params = {
    AttributeNames: ["SentTimestamp"],
    MaxNumberOfMessages: 1,
    MessageAttributeNames: ["All"],
    QueueUrl: queueURL,
    WaitTimeSeconds: 20,
};

const run = async () => {
    try {
        const data = await sqsClient.send(new ReceiveMessageCommand(params));
        console.log("Success, ", data);
        return data; // For unit tests.
    } catch (err) {
        console.log("Error", err);
    }
};
run();
```

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Receive a message from an Amazon SQS queue using long-poll support.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create the SQS service object
var sqs = new AWS.SQS({apiVersion: '2012-11-05'});

var queueURL = "SQS_QUEUE_URL";

var params = {
    AttributeNames: [
        "SentTimestamp"
```

```
        ],
        MaxNumberOfMessages: 1,
        MessageAttributeNames: [
            "All"
        ],
        QueueUrl: queueURL,
        WaitTimeSeconds: 20
    };

    sqs.receiveMessage(params, function(err, data) {
        if (err) {
            console.log("Error", err);
        } else {
            console.log("Success", data);
        }
    });
}
```

## Kotlin

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun receiveMessages(queueUrlVal: String?) {

    println("Retrieving messages from $queueUrlVal")

    val receiveMessageRequest = ReceiveMessageRequest {
        queueUrl = queueUrlVal
        maxNumberOfMessages = 5
    }

    SqsClient { region = "us-east-1" }.use { sqsClient ->
        val response = sqsClient.receiveMessage(receiveMessageRequest)
        response.messages?.forEach { message ->
            println(message.body)
        }
    }
}
```
