There are more AWS SDK examples available in the [AWS Doc SDK Examples GitHub repo](#).

# What is the code example library?

The code example library is a collection of code examples that show you how to use AWS software development kits (SDKs) with AWS.

The examples are organized by AWS service and by AWS SDK. The same examples can be found in each section.

- **Code examples by service (p. 3)** – A list of AWS services that contain examples of how to use each service with AWS SDKs. Use this section if you know which service you want to use.
- **Code examples by SDK (p. 2267)** – A list of AWS SDKs that contain examples of how to use AWS services with each SDK. Use this section if you know which SDK you want to use.

Within each section, the examples are divided into the following categories:

- *Actions* are code excerpts that show you how to call individual service functions.
- *Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.
- *Cross-service examples* are sample applications that work across multiple AWS services.

All of the examples in this library can also be found in the [AWS Code Examples GitHub repository](#). The GitHub repository also contains instructions on how to set up, run, and test the examples.

## Using AWS services with an AWS SDK

AWS software development kits (SDKs) are available for many popular programming languages. Each SDK provides an API, code examples, and documentation that make it easier for developers to build applications in their preferred language.

SDK documentation	Code examples

## Code examples for ACM using AWS SDKs

The following code examples show how to use AWS Certificate Manager with an AWS software development kit (SDK).

### Code examples

- [Actions for ACM using AWS SDKs \(p. 5\)](#)
  - Add tags to an ACM certificate using an AWS SDK (p. 5)
  - Delete an ACM certificate using an AWS SDK (p. 6)
  - Describe an ACM certificate using an AWS SDK (p. 7)
  - Get an ACM certificate using an AWS SDK (p. 9)
  - Import an ACM certificate using an AWS SDK (p. 10)
  - List ACM certificates using an AWS SDK (p. 11)
  - List tags for an ACM certificate using an AWS SDK (p. 13)
  - Remove tags from an ACM certificate using an AWS SDK (p. 13)
  - Request validation of an ACM certificate using an AWS SDK (p. 14)
  - Resend validation email for an ACM certificate using an AWS SDK (p. 15)
- [Scenarios for ACM using AWS SDKs \(p. 16\)](#)
  - Manage ACM certificates using an AWS SDK (p. 16)

## Actions for ACM using AWS SDKs

The following code examples show how to use AWS Certificate Manager with AWS SDKs. Each example calls an individual service function.

### Examples

- [Add tags to an ACM certificate using an AWS SDK \(p. 5\)](#)
- [Delete an ACM certificate using an AWS SDK \(p. 6\)](#)
- [Describe an ACM certificate using an AWS SDK \(p. 7\)](#)
- [Get an ACM certificate using an AWS SDK \(p. 9\)](#)
- [Import an ACM certificate using an AWS SDK \(p. 10\)](#)
- [List ACM certificates using an AWS SDK \(p. 11\)](#)
- [List tags for an ACM certificate using an AWS SDK \(p. 13\)](#)
- [Remove tags from an ACM certificate using an AWS SDK \(p. 13\)](#)
- [Request validation of an ACM certificate using an AWS SDK \(p. 14\)](#)
- [Resend validation email for an ACM certificate using an AWS SDK \(p. 15\)](#)

## Add tags to an ACM certificate using an AWS SDK

The following code example shows how to add tags to ACM certificates.

### Python

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class AcmCertificate:  
    """  
    Encapsulates ACM functions.  
    """  
    def __init__(self, acm_client):
```

```
"""
:param acm_client: A Boto3 ACM client.
"""
self.acm_client = acm_client

def add_tags(self, certificate_arn, tags):
    """
    Adds tags to a certificate. Tags are key-value pairs that contain custom
    metadata.

    :param certificate_arn: The ARN of the certificate.
    :param tags: A dictionary of key-value tags to add to the certificate.
    """
    try:
        self.acm_client.add_tags_to_certificate(
            CertificateArn=certificate_arn,
            Tags=[{'Key': key, 'Value': value} for key, value in tags.items()])
        logger.info("Added %s tags to certificate %s.", len(tags),
                    certificate_arn)
    except ClientError:
        logger.exception("Couldn't add tags to certificate %s.",
                         certificate_arn)
        raise
```

- For API details, see [AddTagsToCertificate in AWS SDK for Python \(Boto3\) API Reference](#).

## Delete an ACM certificate using an AWS SDK

The following code example shows how to delete ACM certificates.

Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class AcmCertificate:
    """
    Encapsulates ACM functions.
    """
    def __init__(self, acm_client):
        """
        :param acm_client: A Boto3 ACM client.
        """
        self.acm_client = acm_client

    def remove(self, certificate_arn):
        """
        Removes a certificate.

        :param certificate_arn: The ARN of the certificate to remove.
        """
        try:
            self.acm_client.delete_certificate(CertificateArn=certificate_arn)
            logger.info("Removed certificate %s.", certificate_arn)
        except ClientError:
            logger.exception("Couldn't remove certificate %s.", certificate_arn)
```

```
raise
```

- For API details, see [DeleteCertificate](#) in *AWS SDK for Python (Boto3) API Reference*.

## Describe an ACM certificate using an AWS SDK

The following code examples show how to describe ACM certificates.

.NET

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using Amazon;
using Amazon.CertificateManager;
using Amazon.CertificateManager.Model;
using System;
using System.Threading.Tasks;

namespace DescribeCertificate
{
    class DescribeCertificate
    {
        // The following example retrieves and displays the metadata for a
        // certificate using the AWS Certificate Manager (ACM) service. It
        // was created using AWS SDK for .NET 3.5 and .NET 5.0.

        // Specify your AWS Region (an example Region is shown).
        private static readonly RegionEndpoint ACMRegion = RegionEndpoint.USEast1;
        private static AmazonCertificateManagerClient _client;

        static void Main(string[] args)
        {
            var _client = new
                Amazon.CertificateManager.AmazonCertificateManagerClient(ACMRegion);

            var describeCertificateReq = new DescribeCertificateRequest();
            // The ARN used here is just an example. Replace it with the ARN of
            // a certificate that exists on your account.
            describeCertificateReq.CertificateArn =
                "arn:aws:acm:us-
east-1:123456789012:certificate/8cf7dae-9b6a-2d07-92bc-1c309EXAMPLE";

            var certificateDetailResp =
                DescribeCertificateResponseAsync(client: _client, request:
            describeCertificateReq);
            var certificateDetail = certificateDetailResp.Result.Certificate;

            if (certificateDetail is not null)
            {
                DisplayCertificateDetails(certificateDetail);
            }
        }

        /// <summary>

## Rust

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Displays the Amazon API Gateway REST APIs in the Region.

```
async fn show_apis(client: &Client) -> Result<(), Error> {
    let resp = client.get_rest_apis().send().await?;

    for api in resp.items().unwrap_or_default() {
        println!("ID:      {}", api.id().unwrap_or_default());
        println!("Name:    {}", api.name().unwrap_or_default());
        println!("Description: {}", api.description().unwrap_or_default());
        println!("Version:  {}", api.version().unwrap_or_default());
        println!(
            "Created:  {}",
            api.created_date().unwrap().to_chrono_utc()
        );
        println!();
    }
    Ok(())
}
```

```
require 'vendor/autoload.php';

use Aws\ApiGateway\ApiGatewayClient;
use Aws\Exception\AwsException;

/* /////////////////////////////////
 * Purpose: Lists the base path mapping for a custom domain name in
 * Amazon API Gateway.
 *
 * Prerequisites: A custom domain name in API Gateway. For more information,
 * see "Custom Domain Names" in the Amazon API Gateway Developer Guide.
 *
 * Inputs:
 * - $apiGatewayClient: An initialized AWS SDK for PHP API client for
 *   API Gateway.
 * - $domainName: The custom domain name for the base path mappings.
 *
 * Returns: Information about the base path mappings, if available;
 * otherwise, the error message.
 */
```

```
* ///////////////////////////////*/
function listBasePathMappings($apiGatewayClient, $domainName)
{
    try {
        $result = $apiGatewayClient->getbasePathMappings([
            'domainName' => $domainName
        ]);
        return 'The base path mapping(s) effective URI is: ' .
            $result['@metadata']['effectiveUri'];
    } catch (AwsException $e) {
        return 'Error: ' . $e['message'];
    }
}

function listThebasePathMappings()
{
    $apiGatewayClient = new ApiGatewayClient([
        'profile' => 'default',
        'region' => 'us-east-1',
        'version' => '2015-07-09'
    ]);

    echo listBasePathMappings($apiGatewayClient, 'example.com');
}

// Uncomment the following line to run this code in an AWS account.
// listThebasePathMappings();
```

- For API details, see [ListBasePathMappings](#) in *AWS SDK for PHP API Reference*.

## Update the base path mapping for a custom domain name in API Gateway

The following code example shows how to update an API Gateway base path mapping.

PHP

### SDK for PHP

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
require 'vendor/autoload.php';

use Aws\ApiGateway\ApiGatewayClient;
use Aws\Exception\AwsException;

/* //////////////////////////////*/
/*
 * Purpose: Updates the base path mapping for a custom domain name
 * in Amazon API Gateway.
 *
 * Inputs:
 * - $apiGatewayClient: An initialized AWS SDK for PHP API client for
 *   API Gateway.
 * - $basePath: The base path name that callers must provide as part of the
 *   URL after the domain name.
 * - $domainName: The custom domain name for the base path mapping.
```

```
* - $patchOperations: The base path update operations to apply.  
*  
* Returns: Information about the updated base path mapping, if available;  
* otherwise, the error message.  
* ///////////////////////////////// *//  
  
function updateBasePathMapping($apiGatewayClient, $basePath, $domainName,  
    $patchOperations)  
{  
    try {  
        $result = $apiGatewayClient->updateBasePathMapping([  
            'basePath' => $basePath,  
            'domainName' => $domainName,  
            'patchOperations' => $patchOperations  
        ]);  
        return 'The updated base path\'s URI is: ' .  
            $result['@metadata']['effectiveUri'];  
    } catch (AwsException $e) {  
        return 'Error: ' . $e['message'];  
    }  
}  
  
function updateTheBasePathMapping()  
{  
    $patchOperations = array([  
        'op' => 'replace',  
        'path' => '/stage',  
        'value' => 'stage2'  
    ]);  
  
    $apiGatewayClient = new ApiGatewayClient([  
        'profile' => 'default',  
        'region' => 'us-east-1',  
        'version' => '2015-07-09'  
    ]);  
  
    echo updateBasePathMapping(  
        $apiGatewayClient,  
        '(none)',  
        'example.com',  
        $patchOperations);  
}  
  
// Uncomment the following line to run this code in an AWS account.  
// updateTheBasePathMapping();
```

- For API details, see [UpdateBasePathMapping](#) in *AWS SDK for PHP API Reference*.

## Scenarios for API Gateway using AWS SDKs

The following code examples show how to use Amazon API Gateway with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Create and deploy a REST API using an AWS SDK \(p. 41\)](#)

## Create and deploy a REST API using an AWS SDK

The following code example shows how to:

- Create a REST API served by API Gateway.
- Add resources to the REST API to represent a user profile.
- Add integration methods so that the REST API uses a DynamoDB table to store user profile data.
- Send HTTP requests to the REST API to add and retrieve user profiles.

## Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a class that wraps API Gateway operations.

```
import argparse
import json

## Cross-service examples for API Gateway using AWS SDKs

The following code examples show how to use Amazon API Gateway with AWS SDKs. Each example contains a sample application that works across multiple AWS services.

### Examples

- [Create an API Gateway REST API to track COVID-19 data \(p. 46\)](#)
- [Create a lending library REST API \(p. 47\)](#)
- [Create a websocket chat application with API Gateway \(p. 47\)](#)
- [Use API Gateway to invoke a Lambda function \(p. 48\)](#)

### Create an API Gateway REST API to track COVID-19 data

The following code example shows how to create a REST API that simulates a system to track daily cases of COVID-19 in the United States, using fictional data.

#### Python

##### SDK for Python (Boto3)

Shows how to use AWS Chalice with the AWS SDK for Python (Boto3) to create a serverless REST API that uses Amazon API Gateway, AWS Lambda, and Amazon DynamoDB. The REST API simulates a system that tracks daily cases of COVID-19 in the United States, using fictional data. Learn how to:

- Use AWS Chalice to define routes in Lambda functions that are called to handle REST requests that come through API Gateway.
- Use Lambda functions to retrieve and store data in a DynamoDB table to serve REST requests.
- Define table structure and security role resources in an AWS CloudFormation template.
- Use AWS Chalice and CloudFormation to package and deploy all necessary resources.
- Use CloudFormation to clean up all created resources.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- API Gateway
- AWS CloudFormation
- DynamoDB
- Lambda

## Create a lending library REST API

The following code example shows how to create a lending library where patrons can borrow and return books by using a REST API backed by an Amazon Aurora database.

Python

### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) with the Amazon Relational Database Service (Amazon RDS) API and AWS Chalice to create a REST API backed by an Amazon Aurora database. The web service is fully serverless and represents a simple lending library where patrons can borrow and return books. Learn how to:

- Create and manage a serverless Aurora database cluster.
- Use AWS Secrets Manager to manage database credentials.
- Implement a data storage layer that uses Amazon RDS to move data into and out of the database.
- Use AWS Chalice to deploy a serverless REST API to Amazon API Gateway and AWS Lambda.
- Use the Requests package to send requests to the web service.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- API Gateway
- Lambda
- Amazon RDS
- Secrets Manager

## Create a websocket chat application with API Gateway

The following code example shows how to create a chat application that is served by a websocket API built on Amazon API Gateway.

Python

### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) with Amazon API Gateway V2 to create a websocket API that integrates with AWS Lambda and Amazon DynamoDB.

- Create a websocket API served by API Gateway.
- Define a Lambda handler that stores connections in DynamoDB and posts messages to other chat participants.
- Connect to the websocket chat application and send messages with the Websockets package.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- API Gateway
- DynamoDB
- Lambda

## Use API Gateway to invoke a Lambda function

The following code examples show how to create an AWS Lambda function invoked by Amazon API Gateway.

Java

### SDK for Java 2.x

Shows how to create an AWS Lambda function by using the Lambda Java runtime API. This example invokes different AWS services to perform a specific use case. This example demonstrates how to create a Lambda function invoked by Amazon API Gateway that scans an Amazon DynamoDB table for work anniversaries and uses Amazon Simple Notification Service (Amazon SNS) to send a text message to your employees that congratulates them at their one year anniversary date.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- API Gateway
- DynamoDB
- Lambda
- Amazon SNS

JavaScript

### SDK for JavaScript V3

Shows how to create an AWS Lambda function by using the Lambda JavaScript runtime API. This example invokes different AWS services to perform a specific use case. This example demonstrates how to create a Lambda function invoked by Amazon API Gateway that scans an Amazon DynamoDB table for work anniversaries and uses Amazon Simple Notification Service (Amazon SNS) to send a text message to your employees that congratulates them at their one year anniversary date.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

This example is also available in the [AWS SDK for JavaScript v3 developer guide](#).

### Services used in this example

- API Gateway
- DynamoDB
- Lambda

- Amazon SNS

Python

#### SDK for Python (Boto3)

This example shows how to create and use an Amazon API Gateway REST API that targets an AWS Lambda function. The Lambda handler demonstrates how to route based on HTTP methods; how to get data from the query string, header, and body; and how to return a JSON response.

- Deploy a Lambda function.
- Create an API Gateway REST API.
- Create a REST resource that targets the Lambda function.
- Grant permission to let API Gateway invoke the Lambda function.
- Use the Requests package to send requests to the REST API.
- Clean up all resources created during the demo.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- API Gateway
- Lambda

## Code examples for API Gateway Management API using AWS SDKs

The following code examples show how to use Amazon API Gateway Management API with an AWS software development kit (SDK).

#### Code examples

- [Actions for API Gateway Management API using AWS SDKs \(p. 49\)](#)
  - [Send the provided data to the specified connection using an AWS SDK \(p. 49\)](#)

## Actions for API Gateway Management API using AWS SDKs

The following code examples show how to use Amazon API Gateway Management API with AWS SDKs. Each example calls an individual service function.

#### Examples

- [Send the provided data to the specified connection using an AWS SDK \(p. 49\)](#)

## Send the provided data to the specified connection using an AWS SDK

The following code example shows how to send data to a connection.

Rust

## SDK for Rust

## Create an Audit Manager assessment report that contains one day of evidence using an AWS SDK

The following code example shows how to create an Audit Manager assessment report that contains one day of evidence.

Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
import dateutil.parser
import logging
import time
import urllib.request
import uuid
import boto3
from botocore.exceptions import ClientError

logger = logging.getLogger(__name__)

class AuditReport:
    def __init__(self, auditmanager_client):
        self.auditmanager_client = auditmanager_client

## Scenarios for Aurora using AWS SDKs

The following code examples show how to use Amazon Aurora with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Get started with Aurora DB clusters using an AWS SDK \(p. 97\)](#)

## Get started with Aurora DB clusters using an AWS SDK

The following code examples show how to:

- Create a custom Aurora DB cluster parameter group and set parameter values.
- Create a DB cluster that is configured to use the parameter group.
- Create a DB instance in the DB cluster that contains a database.
- Take a snapshot of the DB cluster.
- Delete the instance, DB cluster, and parameter group.

Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/**  
 * Before running this Java (v2) code example, set up your development environment,  
 * including your credentials.  
 *  
 * For more information, see the following documentation topic:  
 *  
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html  
 *  
 * This Java example performs the following tasks:  
 *  
 * 1. Gets available engine families for Amazon Aurora MySQL-Compatible Edition by  
 *    calling the DescribeDbEngineVersions(Engine='aurora-mysql') method.  
 * 2. Selects an engine family and creates a custom DB cluster parameter group by  
 *    invoking the describeDBClusterParameters method.  
 * 3. Gets the parameter groups by invoking the describeDBClusterParameterGroups  
 *    method.  
 * 4. Gets parameters in the group by invoking the describeDBClusterParameters  
 *    method.  
 * 5. Modifies the auto_increment_offset parameter by invoking the  
 *    modifyDBClusterParameterGroupRequest method.  
 * 6. Gets and displays the updated parameters.  
 * 7. Gets a list of allowed engine versions by invoking the  
 *    describeDbEngineVersions method.  
 * 8. Creates an Aurora DB cluster database cluster that contains a MySQL database.  
 * 9. Waits for DB instance to be ready.  
 * 10. Gets a list of instance classes available for the selected engine.  
 * 11. Creates a database instance in the cluster.  
 * 12. Waits for DB instance to be ready.  
 * 13. Creates a snapshot.  
 * 14. Waits for DB snapshot to be ready.  
 * 15. Deletes the DB cluster.
```

```
* 16. Deletes the DB cluster group.

## Kotlin

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/**  
Before running this Kotlin code example, set up your development environment,  
including your credentials.  
  
For more information, see the following documentation topic:  
https://docs.aws.amazon.com/sdk-for-kotlin/latest/developer-guide/setup.html  
  
This Kotlin example performs the following tasks:  
  
1. Returns a list of the available DB engines.  
2. Creates a custom DB parameter group.  
3. Gets the parameter groups.  
4. Gets the parameters in the group.  
5. Modifies the auto_increment_increment parameter.  
6. Displays the updated parameter value.  
7. Gets a list of allowed engine versions.  
8. Creates an Aurora DB cluster database.  
9. Waits for DB instance to be ready.  
10. Gets a list of instance classes available for the selected engine.  
11. Creates a database instance in the cluster.  
12. Waits for the database instance in the cluster to be ready.  
13. Creates a snapshot.  
14. Waits for DB snapshot to be ready.  
15. Deletes the DB instance.  
16. Deletes the DB cluster.  
17. Deletes the DB cluster group.  
*/

## Cross-service examples for Aurora using AWS SDKs

The following code examples show how to use Amazon Aurora with AWS SDKs. Each example contains a sample application that works across multiple AWS services.

### Examples

- [Create an Aurora Serverless work item tracker \(p. 126\)](#)

## Create an Aurora Serverless work item tracker

The following code examples show how to create a web application that tracks work items in an Amazon Aurora Serverless database and uses Amazon Simple Email Service (Amazon SES) to send reports.

.NET

### AWS SDK for .NET

Shows how to use the AWS SDK for .NET to create a web application that tracks work items in an Amazon Aurora database and emails reports by using Amazon Simple Email Service (Amazon SES). This example uses a front end built with React.js to interact with a RESTful .NET backend.

- Integrate a React web application with AWS services.
- List, add, update, and delete items in an Aurora table.
- Send an email report of filtered work items using Amazon SES.
- Deploy and manage example resources with the included AWS CloudFormation script.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

C++

### SDK for C++

Shows how to create a web application that tracks and reports on work items stored in an Amazon Aurora Serverless database.

For complete source code and instructions on how to set up a C++ REST API that queries Amazon Aurora Serverless data and for use by a React application, see the full example on [GitHub](#).

### Services used in this example

- Aurora

- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

Java

### SDK for Java 2.x

Shows how to create a web application that tracks and reports on work items stored in an Amazon RDS database.

For complete source code and instructions on how to set up a Spring REST API that queries Amazon Aurora Serverless data and for use by a React application, see the full example on [GitHub](#).

For complete source code and instructions on how to set up and run an example that uses the JDBC API, see the full example on [GitHub](#).

#### Services used in this example

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

JavaScript

### SDK for JavaScript V3

Shows how to use the AWS SDK for JavaScript (v3) to create a web application that tracks work items in an Amazon Aurora database and emails reports by using Amazon Simple Email Service (Amazon SES). This example uses a front end built with React.js to interact with an Express Node.js backend.

- Integrate a React.js web application with AWS services.
- List, add, and update items in an Aurora table.
- Send an email report of filtered work items by using Amazon SES.
- Deploy and manage example resources with the included AWS CloudFormation script.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

Kotlin

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

Shows how to create a web application that tracks and reports on work items stored in an Amazon RDS database.

For complete source code and instructions on how to set up a Spring REST API that queries Amazon Aurora Serverless data and for use by a React application, see the full example on [GitHub](#).

#### **Services used in this example**

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

PHP

#### **SDK for PHP**

Shows how to use the AWS SDK for PHP to create a web application that tracks work items in an Amazon RDS database and emails reports by using Amazon Simple Email Service (Amazon SES). This example uses a front end built with React.js to interact with a RESTful PHP backend.

- Integrate a React.js web application with AWS services.
- List, add, update, and delete items in an Amazon RDS table.
- Send an email report of filtered work items using Amazon SES.
- Deploy and manage example resources with the included AWS CloudFormation script.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### **Services used in this example**

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

Python

#### **SDK for Python (Boto3)**

Shows how to use the AWS SDK for Python (Boto3) to create a REST service that tracks work items in an Amazon Aurora Serverless database and emails reports by using Amazon Simple Email Service (Amazon SES). This example uses the Flask web framework to handle HTTP routing and integrates with a React webpage to present a fully functional web application.

- Build a Flask REST service that integrates with AWS services.
- Read, write, and update work items that are stored in an Aurora Serverless database.
- Create an AWS Secrets Manager secret that contains database credentials and use it to authenticate calls to the database.
- Use Amazon SES to send email reports of work items.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### **Services used in this example**

- Aurora

- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

## Code examples for AWS Batch using AWS SDKs

The following code examples show how to use AWS Batch with an AWS software development kit (SDK).

### Code examples

- [Actions for AWS Batch using AWS SDKs \(p. 129\)](#)
  - [Describe one or more AWS Batch compute environments using an AWS SDK \(p. 129\)](#)

## Actions for AWS Batch using AWS SDKs

The following code examples show how to use AWS Batch with AWS SDKs. Each example calls an individual service function.

### Examples

- [Describe one or more AWS Batch compute environments using an AWS SDK \(p. 129\)](#)

## Describe one or more AWS Batch compute environments using an AWS SDK

The following code example shows how to describe one or more AWS Batch compute environments.

Rust

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn show_envs(client: &Client) -> Result<(), Error> {
    let rsp = client.describe_compute_environments().send().await?;

    let compute_envs = rsp.compute_environments().unwrap_or_default();
    println!("Found {} compute environments:", compute_envs.len());
    for env in compute_envs {
        let arn = env.compute_environment_arn().unwrap_or_default();
        let name = env.compute_environment_name().unwrap_or_default();

        println!("  Name : {}", name);
        println!("  ARN:   {}", arn);
        println!("");
    }
    Ok(())
}
```

- For API details, see [DescribeComputeEnvironments](#) in *AWS SDK for Rust API reference*.

## Code examples for AWS CloudFormation using AWS SDKs

The following code examples show how to use AWS CloudFormation with an AWS software development kit (SDK).

### Code examples

- [Cross-service examples for AWS CloudFormation using AWS SDKs \(p. 130\)](#)
  - [Create an API Gateway REST API to track COVID-19 data \(p. 130\)](#)

## Cross-service examples for AWS CloudFormation using AWS SDKs

The following code examples show how to use AWS CloudFormation with AWS SDKs. Each example contains a sample application that works across multiple AWS services.

### Examples

- [Create an API Gateway REST API to track COVID-19 data \(p. 130\)](#)

## Create an API Gateway REST API to track COVID-19 data

The following code example shows how to create a REST API that simulates a system to track daily cases of COVID-19 in the United States, using fictional data.

### Python

#### SDK for Python (Boto3)

Shows how to use AWS Chalice with the AWS SDK for Python (Boto3) to create a serverless REST API that uses Amazon API Gateway, AWS Lambda, and Amazon DynamoDB. The REST API simulates a system that tracks daily cases of COVID-19 in the United States, using fictional data. Learn how to:

- Use AWS Chalice to define routes in Lambda functions that are called to handle REST requests that come through API Gateway.
- Use Lambda functions to retrieve and store data in a DynamoDB table to serve REST requests.
- Define table structure and security role resources in an AWS CloudFormation template.
- Use AWS Chalice and CloudFormation to package and deploy all necessary resources.
- Use CloudFormation to clean up all created resources.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- API Gateway
- AWS CloudFormation
- DynamoDB
- Lambda

# Code examples for CloudFront using AWS SDKs

The following code examples show how to use Amazon CloudFront with an AWS software development kit (SDK).

## Code examples

- [Actions for CloudFront using AWS SDKs \(p. 131\)](#)
  - [Create a CloudFront function using an AWS SDK \(p. 131\)](#)
  - [Get CloudFront distribution configuration using an AWS SDK \(p. 132\)](#)
  - [List CloudFront distributions using an AWS SDK \(p. 132\)](#)
  - [Update a CloudFront distribution using an AWS SDK \(p. 133\)](#)

## Actions for CloudFront using AWS SDKs

The following code examples show how to use Amazon CloudFront with AWS SDKs. Each example calls an individual service function.

### Examples

- [Create a CloudFront function using an AWS SDK \(p. 131\)](#)
- [Get CloudFront distribution configuration using an AWS SDK \(p. 132\)](#)
- [List CloudFront distributions using an AWS SDK \(p. 132\)](#)
- [Update a CloudFront distribution using an AWS SDK \(p. 133\)](#)

## Create a CloudFront function using an AWS SDK

The following code example shows how to create an Amazon CloudFront function.

Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static String createNewFunction(CloudFrontClient cloudFrontClient,
String functionName, String filePath) {
    try {
        InputStream is = new FileInputStream(filePath);
        SdkBytes functionCode = SdkBytes.fromInputStream(is);

        FunctionConfig config = FunctionConfig.builder()
            .comment("Created by using the CloudFront Java API")
            .runtime(FunctionRuntime.CLOUDFRONT_JS_1_0)
            .build();

        CreateFunctionRequest functionRequest = CreateFunctionRequest.builder()
            .name(functionName)
            .functionCode(functionCode)
            .functionConfig(config)
            .build();
    }
}
```

```
        CreateFunctionResponse response =
    cloudFrontClient.createFunction(functionRequest);
    return response.functionSummary().functionMetadata().functionARN();

} catch (CloudFrontException | FileNotFoundException e){
    System.err.println(e.getMessage());
    System.exit(1);
}
return "";
}
```

- For API details, see [CreateFunction](#) in *AWS SDK for Java 2.x API Reference*.

## Get CloudFront distribution configuration using an AWS SDK

The following code example shows how to get Amazon CloudFront distribution configuration.

Python

### SDK for Python (Boto3)

#### Note

## Code examples for CloudWatch using AWS SDKs

The following code examples show how to use Amazon CloudWatch with an AWS software development kit (SDK).

### Code examples

- [Actions for CloudWatch using AWS SDKs \(p. 135\)](#)
  - Create a CloudWatch alarm that watches a metric using an AWS SDK (p. 136)
  - Delete CloudWatch alarms using an AWS SDK (p. 141)
  - Describe a CloudWatch alarm's history using an AWS SDK (p. 147)
  - Describe CloudWatch alarms using an AWS SDK (p. 148)
  - Describe CloudWatch alarms for a metric using an AWS SDK (p. 148)
  - Disable CloudWatch alarm actions using an AWS SDK (p. 153)
  - Enable CloudWatch alarm actions using an AWS SDK (p. 158)
  - Get the details of a CloudWatch dashboard (p. 164)
  - Get CloudWatch metric statistics using an AWS SDK (p. 165)
  - List CloudWatch dashboards (p. 166)
  - List CloudWatch metrics using an AWS SDK (p. 167)
  - Put a set of data into a CloudWatch metric using an AWS SDK (p. 174)
  - Put data into a CloudWatch metric using an AWS SDK (p. 174)
- [Scenarios for CloudWatch using AWS SDKs \(p. 178\)](#)
  - Get started with CloudWatch alarms using an AWS SDK (p. 179)
  - Manage CloudWatch metrics and alarms using an AWS SDK (p. 180)

## Actions for CloudWatch using AWS SDKs

The following code examples show how to use Amazon CloudWatch with AWS SDKs. Each example calls an individual service function.

### Examples

- [Create a CloudWatch alarm that watches a metric using an AWS SDK \(p. 136\)](#)
- [Delete CloudWatch alarms using an AWS SDK \(p. 141\)](#)
- [Describe a CloudWatch alarm's history using an AWS SDK \(p. 147\)](#)
- [Describe CloudWatch alarms using an AWS SDK \(p. 148\)](#)
- [Describe CloudWatch alarms for a metric using an AWS SDK \(p. 148\)](#)

- [Disable CloudWatch alarm actions using an AWS SDK \(p. 153\)](#)
- [Enable CloudWatch alarm actions using an AWS SDK \(p. 158\)](#)
- [Get the details of a CloudWatch dashboard \(p. 164\)](#)
- [Get CloudWatch metric statistics using an AWS SDK \(p. 165\)](#)
- [List CloudWatch dashboards \(p. 166\)](#)
- [List CloudWatch metrics using an AWS SDK \(p. 167\)](#)
- [Put a set of data into a CloudWatch metric using an AWS SDK \(p. 174\)](#)
- [Put data into a CloudWatch metric using an AWS SDK \(p. 174\)](#)

## Create a CloudWatch alarm that watches a metric using an AWS SDK

The following code examples show how to create an Amazon CloudWatch alarm that watches a metric.

C++

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Include the required files.

```
#include <aws/core/Aws.h>
#include <aws/monitoring/CloudWatchClient.h>
#include <aws/monitoring/model/PutMetricAlarmRequest.h>
#include <iostream>
```

Create the alarm to watch the metric.

```
Aws::CloudWatch::CloudWatchClient cw;
Aws::CloudWatch::Model::PutMetricAlarmRequest request;
request.SetAlarmName(alarm_name);
request.SetComparisonOperator(
    Aws::CloudWatch::Model::ComparisonOperator::GreaterThanThreshold);
request.SetEvaluationPeriods(1);
request.SetMetricName("CPUUtilization");
request.SetNamespace("AWS/EC2");
request.SetPeriod(60);
request.SetStatistic(Aws::CloudWatch::Model::Statistic::Average);
request.SetThreshold(70.0);
request.SetActionsEnabled(false);
request.SetAlarmDescription("Alarm when server CPU exceeds 70%");
request.SetUnit(Aws::CloudWatch::Model::StandardUnit::Seconds);

Aws::CloudWatch::Model::Dimension dimension;
dimension.SetName("InstanceId");
dimension.SetValue(instanceId);

request.AddDimensions(dimension);

auto outcome = cw.PutMetricAlarm(request);
if (!outcome.IsSuccess())
{
    std::cout << "Failed to create CloudWatch alarm:" <<
        outcome.GetError().GetMessage() << std::endl;
```

```
        }
    else
    {
        std::cout << "Successfully created CloudWatch alarm " << alarm_name
        << std::endl;
    }
}
```

- For API details, see [PutMetricAlarm](#) in *AWS SDK for C++ API Reference*.

## Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void putMetricAlarm(CloudWatchClient cw, String alarmName, String
instanceId) {

    try {
        Dimension dimension = Dimension.builder()
            .name("InstanceId")
            .value(instanceId).build();

        PutMetricAlarmRequest request = PutMetricAlarmRequest.builder()
            .alarmName(alarmName)
            .comparisonOperator(ComparisonOperator.GREATER_THAN_THRESHOLD)
            .evaluationPeriods(1)
            .metricName("CPUUtilization")
            .namespace("AWS/EC2")
            .period(60)
            .statistic(Statistic.AVERAGE)
            .threshold(70.0)
            .actionsEnabled(false)
            .alarmDescription("Alarm when server CPU utilization exceeds 70%")
            .unit(StandardUnit.SECONDS)
            .dimensions(dimension)
            .build();

        cw.putMetricAlarm(request);
        System.out.printf("Successfully created alarm with name %s",
alarmName);

    } catch (CloudWatchException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [PutMetricAlarm](#) in *AWS SDK for Java 2.x API Reference*.

## JavaScript

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { CloudWatchClient } from "@aws-sdk/client-cloudwatch";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon CloudWatch service client object.
export const cwClient = new CloudWatchClient({ region: REGION });
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import { PutMetricAlarmCommand } from "@aws-sdk/client-cloudwatch";
import { cwClient } from "./libs/cloudWatchClient.js";

// Set the parameters
export const params = {
  AlarmName: "Web_Server_CPU_Utilization",
  ComparisonOperator: "GreaterThanOrEqualToThreshold",
  EvaluationPeriods: 1,
  MetricName: "CPUUtilization",
  Namespace: "AWS/EC2",
  Period: 60,
  Statistic: "Average",
  Threshold: 70.0,
  ActionsEnabled: false,
  AlarmDescription: "Alarm when server CPU exceeds 70%",
  Dimensions: [
    {
      Name: "InstanceId",
      Value: "INSTANCE_ID",
    },
  ],
  Unit: "Percent",
};

export const run = async () => {
  try {
    const data = await cwClient.send(new PutMetricAlarmCommand(params));
    console.log("Success", data);
    return data;
  } catch (err) {
    console.log("Error", err);
  }
};
// Uncomment this line to run execution within this file.
// run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [PutMetricAlarm](#) in [AWS SDK for JavaScript API Reference](#).

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Load the AWS SDK for Node.js
```

```
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create CloudWatch service object
var cw = new AWS.CloudWatch({apiVersion: '2010-08-01'});

var params = {
    AlarmName: 'Web_Server_CPU_Utilization',
    ComparisonOperator: 'GreaterThanThreshold',
    EvaluationPeriods: 1,
    MetricName: 'CPUUtilization',
    Namespace: 'AWS/EC2',
    Period: 60,
    Statistic: 'Average',
    Threshold: 70.0,
    ActionsEnabled: false,
    AlarmDescription: 'Alarm when server CPU exceeds 70%',
    Dimensions: [
        {
            Name: 'InstanceId',
            Value: 'INSTANCE_ID'
        },
    ],
    Unit: 'Percent'
};

cw.putMetricAlarm(params, function(err, data) {

## Disable CloudWatch alarm actions using an AWS SDK

The following code examples show how to disable Amazon CloudWatch alarm actions.

.NET

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.Collections.Generic;
using System.Threading.Tasks;
using Amazon.CloudWatch;
using Amazon.CloudWatch.Model;

/// <summary>
/// This example shows how to disable the Amazon CloudWatch actions for
/// one or more CloudWatch alarms. The example was created using the
/// AWS SDK for .NET version 3.7 and .NET Core 5.0.
/// </summary>
public class DisableAlarmActions
{
    public static async Task Main()
    {
        IAmazonCloudWatch cwClient = new AmazonCloudWatchClient();
        var alarmNames = new List<string>
        {
            "ALARM_NAME",
            "ALARM_NAME_2",
        };

        var success = await DisableAlarmsActionsAsync(cwClient, alarmNames);

        if (success)
        {
            Console.WriteLine("Alarm action(s) successfully disabled.");
        }
        else
        {
            Console.WriteLine("Alarm action(s) were not disabled.")
        }
    }

    /// <summary>
    /// Disable the actions for the list of CloudWatch alarm names passed
    /// in the alarmNames parameter.
    /// </summary>
    /// <param name="client">An initialized CloudWatch client object.</param>
    /// <param name="alarmNames">The list of CloudWatch alarms to disable.</param>
    /// <returns>A Boolean value indicating the success of the call.</returns>
    public static async Task<bool> DisableAlarmsActionsAsync(
        IAmazonCloudWatch client,
        List<string> alarmNames)
    {
        var request = new DisableAlarmActionsRequest
        {
```

```
        AlarmNames = alarmNames,
    };

    var response = await client.DisableAlarmActionsAsync(request);

    return response.HttpStatusCode == System.Net.HttpStatusCode.OK;
}
```

## Get CloudWatch metric statistics using an AWS SDK

The following code example shows how to get Amazon CloudWatch metric statistics.

Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class CloudWatchWrapper:
    """Encapsulates Amazon CloudWatch functions."""
    def __init__(self, cloudwatch_resource):
        """
        :param cloudwatch_resource: A Boto3 CloudWatch resource.
        """
        self.cloudwatch_resource = cloudwatch_resource

    def get_metric_statistics(self, namespace, name, start, end, period,
                           stat_types):
```

```
"""
    Gets statistics for a metric within a specified time span. Metrics are
grouped
        into the specified period.

    :param namespace: The namespace of the metric.
    :param name: The name of the metric.
    :param start: The UTC start time of the time span to retrieve.
    :param end: The UTC end time of the time span to retrieve.
    :param period: The period, in seconds, in which to group metrics. The
period
                    must match the granularity of the metric, which depends on
the metric's age. For example, metrics that are older than
three hours have a one-minute granularity, so the period
must
                    be at least 60 and must be a multiple of 60.
    :param stat_types: The type of statistics to retrieve, such as average
value
                    or maximum value.
    :return: The retrieved statistics for the metric.
"""
try:
    metric = self.cloudwatch_resource.Metric(namespace, name)
    stats = metric.get_statistics(
        StartTime=start, EndTime=end, Period=period, Statistics=stat_types)
    logger.info(
        "Got %s statistics for %s.", len(stats['Datapoints']),
        stats['Label'])
except ClientError:
    logger.exception("Couldn't get statistics for %s.%s.", namespace, name)
    raise
else:
    return stats
```

- For API details, see [GetMetricStatistics](#) in *AWS SDK for Python (Boto3) API Reference*.

Create the client in a separate module and export it.

```
import { CloudWatchClient } from "@aws-sdk/client-cloudwatch";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon CloudWatch service client object.
export const cwClient = new CloudWatchClient({ region: REGION });
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import { ListMetricsCommand } from "@aws-sdk/client-cloudwatch";
import { cwClient } from "./libs/cloudWatchClient.js";

// Set the parameters
export const params = {
  Dimensions: [
    {
      Name: "LogGroupName" /* required */,
    },
  ],
  MetricName: "IncomingLogEvents",
  Namespace: "AWS/Logs",
```

```
};

export const run = async () => {
  try {
    const data = await cwClient.send(new ListMetricsCommand(params));
    console.log("Success. Metrics:", JSON.stringify(data.Metrics));
    return data;
  } catch (err) {
    console.log("Error", err);
  }
};

// Uncomment this line to run execution within this file.
// run();
```

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void putMetData(CloudWatchClient cw, Double dataPoint ) {

    try {
        Dimension dimension = Dimension.builder()
            .name("UNIQUE_PAGES")
```

```
.value("URLS")
.build();

// Set an Instant object.
String time =
ZonedDateTime.now( ZoneOffset.UTC ).format( DateTimeFormatter.ISO_INSTANT );
Instant instant = Instant.parse(time);

MetricDatum datum = MetricDatum.builder()
    .metricName("PAGES_VISITED")
    .unit(StandardUnit.NONE)
    .value(dataPoint)
    .timestamp(instant)
    .dimensions(dimension).build();

PutMetricDataRequest request = PutMetricDataRequest.builder()
    .namespace("SITE/TRAFFIC")
    .metricData(datum).build();

cw.putMetricData(request);

} catch (CloudWatchException e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}
System.out.printf("Successfully put data point %f", dataPoint);
}
```

- For API details, see [PutMetricData](#) in *AWS SDK for Java 2.x API Reference*.

## JavaScript

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { CloudWatchClient } from "@aws-sdk/client-cloudwatch";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon CloudWatch service client object.
export const cwClient = new CloudWatchClient({ region: REGION });
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import { PutMetricDataCommand } from "@aws-sdk/client-cloudwatch";
import { cwClient } from "./libs/cloudWatchClient.js";

// Set the parameters
export const params = {
  MetricData: [
    {
      MetricName: "PAGES_VISITED",
```

```
Dimensions: [
  {
    Name: "UNIQUE_PAGES",
    Value: "URLS",
  },
],
Unit: "None",
Value: 1.0,
},
],
Namespace: "SITE/TRAFFIC",
};

export const run = async () => {
try {
  const data = await cwClient.send(new PutMetricDataCommand(params));
  console.log("Success", data.$metadata.requestId);
  return data;
} catch (err) {
  console.log("Error", err);
}
};
// Uncomment this line to run execution within this file.
// run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [PutMetricData](#) in [AWS SDK for JavaScript API Reference](#).

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create CloudWatch service object
var cw = new AWS.CloudWatch({apiVersion: '2010-08-01'});

// Create parameters JSON for putMetricData
var params = {
  MetricData: [
    {
      MetricName: 'PAGES_VISITED',
      Dimensions: [
        {
          Name: 'UNIQUE_PAGES',
          Value: 'URLS'
        },
      ],
      Unit: 'None',
      Value: 1.0
    },
  ],
  Namespace: 'SITE/TRAFFIC'
};

cw.putMetricData(params, function(err, data) {
  if (err) {
    console.log("Error", err);
  }
});
```

```
    } else {
        console.log("Success", JSON.stringify(data));
    }
});
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).

```

- For API details, see [PutMetricData](#) in [AWS SDK for Python \(Boto3\) API Reference](#).

## Scenarios for CloudWatch using AWS SDKs

The following code examples show how to use Amazon CloudWatch with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Get started with CloudWatch alarms using an AWS SDK \(p. 179\)](#)
- [Manage CloudWatch metrics and alarms using an AWS SDK \(p. 180\)](#)

## Get started with CloudWatch alarms using an AWS SDK

The following code example shows how to:

- Create an alarm.
- Disable alarm actions.
- Describe an alarm.
- Delete an alarm.

SAP ABAP

### SDK for SAP ABAP

#### Note

This documentation is for an SDK in developer preview release. The SDK is subject to change and is not recommended for use in production.

## Code examples for CloudWatch Logs using AWS SDKs

The following code examples show how to use Amazon CloudWatch Logs with an AWS software development kit (SDK).

### Code examples

- [Actions for CloudWatch Logs using AWS SDKs \(p. 192\)](#)
  - Associate an AWS KMS key with a CloudWatch Logs log group using an AWS SDK (p. 193)
  - Cancel a CloudWatch Logs export task using an AWS SDK (p. 194)
  - Create a CloudWatch Logs log group using an AWS SDK (p. 194)
  - Create a CloudWatch Logs log stream using an AWS SDK (p. 195)
  - Create a CloudWatch Logs subscription filter using an AWS SDK (p. 196)
  - Create a CloudWatch Logs export task using an AWS SDK (p. 199)
  - Delete a CloudWatch Logs log group using an AWS SDK (p. 200)
  - Delete a CloudWatch Logs subscription filter using an AWS SDK (p. 201)
  - Describe CloudWatch Logs subscription filters using an AWS SDK (p. 204)
  - Describe CloudWatch Logs export tasks using an AWS SDK (p. 208)
  - Describe CloudWatch Logs log groups using an AWS SDK (p. 209)
- [Cross-service examples for CloudWatch Logs using AWS SDKs \(p. 210\)](#)
  - Use scheduled events to invoke a Lambda function (p. 210)

## Actions for CloudWatch Logs using AWS SDKs

The following code examples show how to use Amazon CloudWatch Logs with AWS SDKs. Each example calls an individual service function.

### Examples

- [Associate an AWS KMS key with a CloudWatch Logs log group using an AWS SDK \(p. 193\)](#)
- [Cancel a CloudWatch Logs export task using an AWS SDK \(p. 194\)](#)
- [Create a CloudWatch Logs log group using an AWS SDK \(p. 194\)](#)
- [Create a CloudWatch Logs log stream using an AWS SDK \(p. 195\)](#)
- [Create a CloudWatch Logs subscription filter using an AWS SDK \(p. 196\)](#)
- [Create a CloudWatch Logs export task using an AWS SDK \(p. 199\)](#)
- [Delete a CloudWatch Logs log group using an AWS SDK \(p. 200\)](#)
- [Delete a CloudWatch Logs subscription filter using an AWS SDK \(p. 201\)](#)
- [Describe CloudWatch Logs subscription filters using an AWS SDK \(p. 204\)](#)
- [Describe CloudWatch Logs export tasks using an AWS SDK \(p. 208\)](#)
- [Describe CloudWatch Logs log groups using an AWS SDK \(p. 209\)](#)

## Associate an AWS KMS key with a CloudWatch Logs log group using an AWS SDK

The following code example shows how to associate an AWS KMS key with an existing CloudWatch Logs log group.

.NET

### AWS SDK for .NET

/// 3.7 and .NET Core 5.0.
/// </summary>
public class CreateLogStream
{
    public static async Task Main()
    {
        // This client object will be associated with the same AWS Region
        // as the default user on this system. If you need to use a
        // different AWS Region, pass it as a parameter to the client
        // constructor.
        var client = new AmazonCloudWatchLogsClient();
        string logGroupName = "cloudwatchlogs-example-loggroup";
        string logStreamName = "cloudwatchlogs-example-logstream";

        var request = new CreateLogStreamRequest
        {
            LogGroupName = logGroupName,
            LogStreamName = logStreamName,
        };

        var response = await client.CreateLogStreamAsync(request);

        if (response.HttpStatusCode == System.Net.HttpStatusCode.OK)
        {
            Console.WriteLine($"{logStreamName} successfully created for
{logGroupName}.");
        }
        else
        {
            Console.WriteLine("Could not create stream.");
        }
    }
}
```

- For API details, see [CreateLogStream](#) in [AWS SDK for .NET API Reference](#).

## Create a CloudWatch Logs subscription filter using an AWS SDK

The following code examples show how to create an Amazon CloudWatch Logs subscription filter.

C++

**SDK for C++**

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Include the required files.

```
#include <aws/core/Aws.h>
#include <aws/logs/CloudWatchLogsClient.h>
#include <aws/logs/model/PutSubscriptionFilterRequest.h>
#include <aws/core/utils/Outcome.h>
#include <iostream>
```

Create the subscription filter.

```
Aws::CloudWatchLogs::CloudWatchLogsClient cwl;
Aws::CloudWatchLogs::Model::PutSubscriptionFilterRequest request;
request.SetFilterName(filter_name);
request.SetFilterPattern(filter_pattern);
request.SetLogGroupName(log_group);
request.SetDestinationArn(dest_arn);
auto outcome = cwl.PutSubscriptionFilter(request);
if (!outcome.IsSuccess())
{
    std::cout << "Failed to create CloudWatch logs subscription filter "
        << filter_name << ":" << outcome.GetError().GetMessage() <<
        std::endl;
}
else
{
    std::cout << "Successfully created CloudWatch logs subscription " <<
        "filter " << filter_name << std::endl;
}
```

- For API details, see [PutSubscriptionFilter in AWS SDK for C++ API Reference](#).

Java

**SDK for Java 2.x**

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void putSubFilters(CloudWatchLogsClient cwl,
                                  String filter,
                                  String pattern,
                                  String logGroup,
                                  String functionArn) {

    try {
        PutSubscriptionFilterRequest request =
PutSubscriptionFilterRequest.builder()
            .filterName(filter)
            .filterPattern(pattern)
```

```
.logGroupName(logGroup)
.destinationArn(functionArn)
.build();

cwl.putSubscriptionFilter(request);
System.out.printf(
    "Successfully created CloudWatch logs subscription filter %s",
    filter);

} catch (CloudWatchLogsException e) {
    System.err.println(e.awsErrorDetails().errorMessage());
    System.exit(1);
}
}
```

- For API details, see [PutSubscriptionFilter](#) in *AWS SDK for Java 2.x API Reference*.

## JavaScript

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { CloudWatchLogsClient } from "@aws-sdk/client-cloudwatch-logs";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon CloudWatch Logs service client object.
export const cwlClient = new CloudWatchLogsClient({ region: REGION });
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import {
  PutSubscriptionFilterCommand,
} from "@aws-sdk/client-cloudwatch-logs";
import { cwlClient } from "./libs/cloudWatchLogsClient.js";

// Set the parameters
export const params = {
  destinationArn: "LAMBDA_FUNCTION_ARN", //LAMBDA_FUNCTION_ARN
  filterName: "FILTER_NAME", //FILTER_NAME
  filterPattern: "ERROR",
  logGroupName: "LOG_GROUP", //LOG_GROUP
};

export const run = async () => {
  try {
    const data = await cwlClient.send(new PutSubscriptionFilterCommand(params));
    console.log("Success", data.subscriptionFilters);
    return data; //For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
```

```
// Uncomment this line to run execution within this file.  
// run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).

```
using System;  
using System.Threading.Tasks;  
using Amazon.CloudWatchLogs;  
using Amazon.CloudWatchLogs.Model;  
  
/// <summary>
```

```
/// Shows how to create an Export Task to export the contents of the Amazon
/// CloudWatch Logs to the specified Amazon Simple Storage Service (Amazon S3)
/// bucket. The example was created with the AWS SDK for .NET version 3.7 and
/// .NET Core 5.0.
/// </summary>
public class CreateExportTask
{
    public static async Task Main()
    {
        // This client object will be associated with the same AWS Region
        // as the default user on this system. If you need to use a
        // different AWS Region, pass it as a parameter to the client
        // constructor.
        var client = new AmazonCloudWatchLogsClient();
        string taskName = "export-task-example";
        string logGroupName = "cloudwatchlogs-example-loggroup";
        string destination = "doc-example-bucket";
        var fromTime = 1437584472382;
        var toTime = 1437584472833;

        var request = new CreateExportTaskRequest
        {
            From = fromTime,
            To = toTime,
            TaskName = taskName,
            LogGroupName = logGroupName,
            Destination = destination,
        };

        var response = await client.CreateExportTaskAsync(request);

        if (response.HttpStatusCode == System.Net.HttpStatusCode.OK)
        {
            Console.WriteLine($"The task, {taskName} with ID: " +
                $"{response.TaskId} has been created
successfully.");
        }
    }
}
```

- For API details, see [CreateExportTask](#) in *AWS SDK for .NET API Reference*.

## Delete a CloudWatch Logs log group using an AWS SDK

The following code example shows how to delete an existing CloudWatch Logs log group.

.NET

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.Threading.Tasks;
using Amazon.CloudWatchLogs;
using Amazon.CloudWatchLogs.Model;
```

```
/// <summary>
/// Uses the Amazon CloudWatch Logs Service to delete an existing
/// CloudWatch Logs log group. The example was created using the
/// AWS SDK for .NET version 3.7 and .NET Core 5.0.
/// </summary>
public class DeleteLogGroup
{
    public static async Task Main()
    {
        var client = new AmazonCloudWatchLogsClient();
        string logGroupName = "cloudwatchlogs-example-loggroup";

        var request = new DeleteLogGroupRequest
        {
            LogGroupName = logGroupName,
        };

        var response = await client.DeleteLogGroupAsync(request);

        if (response.HttpStatusCode == System.Net.HttpStatusCode.OK)
        {
            Console.WriteLine($"Successfully deleted CloudWatch log group,
{logGroupName}.");
        }
    }
}
```

- For API details, see [DeleteLogGroup](#) in *AWS SDK for .NET API Reference*.

## Delete a CloudWatch Logs subscription filter using an AWS SDK

The following code examples show how to delete an Amazon CloudWatch Logs subscription filter.

C++

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Include the required files.

```
#include <aws/core/Aws.h>
#include <aws/core/utils/Outcome.h>
#include <aws/logs/CloudWatchLogsClient.h>
#include <aws/logs/model/DeleteSubscriptionFilterRequest.h>
#include <iostream>
```

Delete the subscription filter.

```
Aws::CloudWatchLogs::CloudWatchLogsClient cwl;
Aws::CloudWatchLogs::Model::DeleteSubscriptionFilterRequest request;
request.SetFilterName(filter_name);
request.SetLogGroupName(log_group);
```

```
auto outcome = cwl.DeleteSubscriptionFilter(request);
if (!outcome.IsSuccess()) {
    std::cout << "Failed to delete CloudWatch log subscription filter "
        << filter_name << ":" << outcome.GetError().GetMessage() <<
        std::endl;
} else {
    std::cout << "Successfully deleted CloudWatch logs subscription " <<
        "filter " << filter_name << std::endl;
}
```

- For API details, see [DeleteSubscriptionFilter](#) in *AWS SDK for C++ API Reference*.

## Java

## JavaScript

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { CloudWatchLogsClient } from "@aws-sdk/client-cloudwatch-logs";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon CloudWatch Logs service client object.
```

```
export const cwlClient = new CloudWatchLogsClient({ region: REGION });
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import {
  DeleteSubscriptionFilterCommand
} from "@aws-sdk/client-cloudwatch-logs";
import { cwlClient } from "./libs/cloudWatchLogsClient.js";

// Set the parameters
export const params = {
  filterName: "FILTER", //FILTER
  logGroupName: "LOG_GROUP", //LOG_GROUP
};

export const run = async () => {
  try {
    const data = await cwlClient.send(
      new DeleteSubscriptionFilterCommand(params)
    );
    console.log(
      "Success, subscription filter deleted",
      data
    );
    return data; //For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
// Uncomment this line to run execution within this file.
// run();
```

## Cross-service examples for CloudWatch Logs using AWS SDKs

The following code examples show how to use Amazon CloudWatch Logs with AWS SDKs. Each example contains a sample application that works across multiple AWS services.

### Examples

- [Use scheduled events to invoke a Lambda function \(p. 210\)](#)

## Use scheduled events to invoke a Lambda function

The following code examples show how to create an AWS Lambda function invoked by an Amazon EventBridge scheduled event.

### Python

#### SDK for Python (Boto3)

This example shows how to register an AWS Lambda function as the target of a scheduled Amazon EventBridge event. The Lambda handler writes a friendly message and the full event data to Amazon CloudWatch Logs for later retrieval.

- Deploys a Lambda function.
- Creates an EventBridge scheduled event and makes the Lambda function the target.
- Grants permission to let EventBridge invoke the Lambda function.
- Prints the latest data from CloudWatch Logs to show the result of the scheduled invocations.
- Cleans up all resources created during the demo.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- CloudWatch Logs
- EventBridge
- Lambda

## Code examples for Amazon Cognito Identity using AWS SDKs

The following code examples show how to use Amazon Cognito Identity with an AWS software development kit (SDK).

#### Code examples

- [Actions for Amazon Cognito Identity using AWS SDKs \(p. 211\)](#)
  - Create a new Amazon Cognito Identity with a specified name (p. 211)
  - List Amazon Cognito Identity pools (p. 212)
- [Cross-service examples for Amazon Cognito Identity using AWS SDKs \(p. 213\)](#)
  - Build an Amazon Transcribe app (p. 214)
  - Create an Amazon Textract explorer application (p. 214)

## Actions for Amazon Cognito Identity using AWS SDKs

The following code examples show how to use Amazon Cognito Identity with AWS SDKs. Each example calls an individual service function.

#### Examples

- [Create a new Amazon Cognito Identity with a specified name \(p. 211\)](#)
- [List Amazon Cognito Identity pools \(p. 212\)](#)

## Create a new Amazon Cognito Identity with a specified name

The following code example shows how to find the Amazon Cognito Identity with the given name, creating it if it's not found.

Swift

#### SDK for Swift

##### Note

This is prerelease documentation for an SDK in preview release. It is subject to change.

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a new identity pool.

```
func createIdentityPool(name: String) async throws -> String? {
```

```
let cognitoInputCall = CreateIdentityPoolInput(developerProviderName:  
"com.exampleco.CognitoIdentityDemo",  
                                              identityPoolName: name)  
  
do {  
    let result = try await cognitoIdentityClient.createIdentityPool(input:  
cognitoInputCall)  
    guard let poolId = result.identityPoolId else {  
        return nil  
    }  
  
    return poolId  
  
} catch {  
    print("ERROR: ", dump(error, name: "Error attempting to create the  
identity pool"))  
}  
  
return nil  
}
```

- For more information, see [AWS SDK for Swift developer guide](#).
- For API details, see the following topics in *AWS SDK for Swift API reference*.
  - [createIdentityPool](#)
  - [listIdentityPools](#)

## List Amazon Cognito Identity pools

The following code example shows how to get a list of Amazon Cognito Identity pools.

Swift

### SDK for Swift

#### Note

This is prerelease documentation for an SDK in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Find the ID of an identity pool given its name.

```
func getIdentityPoolID(name: String) async throws -> String? {  
    var token: String? = nil  
  
    // Iterate over the identity pools until a match is found.  
    repeat {  
        /// `token` is a value returned by `ListIdentityPools()` if the  
        returned list  
        /// of identity pools is only a partial list. You use the `token` to  
        tell Cognito that  
        /// you want to continue where you left off previously; specifying  
        `nil` or not providing  
        /// it means "start at the beginning."  
  
        let listPoolsInput = ListIdentityPoolsInput(maxResults: 25, nextToken:  
token)  
  
        /// Read pages of identity pools from Cognito until one is found
```

```
    /// whose name matches the one specified in the `name` parameter.  
    /// Return the matching pool's ID. Each time we ask for the next  
    /// page of identity pools, we pass in the token given by the  
    /// previous page.  
  
    do {  
        let output = try await  
cognitoIdentityClient.listIdentityPools(input: listPoolsInput)  
  
        if let identityPools = output.identityPools {  
            for pool in identityPools {  
                if pool.identityPoolName == name {  
                    return pool.identityPoolId!  
                }  
            }  
        }  
  
        token = output.nextToken  
    } catch {  
        print("ERROR: ", dump(error, name: "Trying to get list of identity  
pools"))  
    }  
} while token != nil  
  
return nil  
}
```

Get the ID of an existing identity pool or create it if it doesn't already exist.

```
public func getOrCreateIdentityPoolID(name: String) async throws -> String? {  
    // See if the pool already exists  
  
    do {  
        guard let poolId = try await self.getIdentityPoolID(name: name) else {  
            let poolId = try await self.createIdentityPool(name: name)  
            return poolId  
        }  
  
        return poolId

## Cross-service examples for Amazon Cognito Identity using AWS SDKs

The following code examples show how to use Amazon Cognito Identity with AWS SDKs. Each example contains a sample application that works across multiple AWS services.

## Examples

- [Build an Amazon Transcribe app \(p. 214\)](#)
- [Create an Amazon Textract explorer application \(p. 214\)](#)

## Build an Amazon Transcribe app

The following code example shows how to use Amazon Transcribe to transcribe and display voice recordings in the browser.

JavaScript

### SDK for JavaScript V3

Create an app that uses Amazon Transcribe to transcribe and display voice recordings in the browser. The app uses two Amazon Simple Storage Service (Amazon S3) buckets, one to host the application code, and another to store transcriptions. The app uses an Amazon Cognito user pool to authenticate your users. Authenticated users have AWS Identity and Access Management (IAM) permissions to access the required AWS services.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

This example is also available in the [AWS SDK for JavaScript v3 developer guide](#).

### Services used in this example

- Amazon Cognito Identity
- Amazon S3
- Amazon Transcribe

## Create an Amazon Textract explorer application

The following code examples show how to explore Amazon Textract output through an interactive application.

JavaScript

### SDK for JavaScript V3

Shows how to use the AWS SDK for JavaScript to build a React application that uses Amazon Textract to extract data from a document image and display it in an interactive web page. This example runs in a web browser and requires an authenticated Amazon Cognito identity for credentials. It uses Amazon Simple Storage Service (Amazon S3) for storage, and for notifications it polls an Amazon Simple Queue Service (Amazon SQS) queue that is subscribed to an Amazon Simple Notification Service (Amazon SNS) topic.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Cognito Identity
- Amazon S3
- Amazon SNS
- Amazon SQS

- Amazon Textract

## Code examples for Amazon Cognito Identity Provider using AWS SDKs

The following code examples show how to use Amazon Cognito Identity Provider with an AWS software development kit (SDK).

### Code examples

- Actions for Amazon Cognito Identity Provider using AWS SDKs (p. 215)
  - Confirm an Amazon Cognito user using an AWS SDK (p. 216)
  - Confirm an MFA device for tracking by Amazon Cognito using an AWS SDK (p. 219)
  - Get a token to associate an MFA application with an Amazon Cognito user using an AWS SDK (p. 221)
  - Get information about an Amazon Cognito user using an AWS SDK (p. 224)
  - List the Amazon Cognito user pools using an AWS SDK (p. 227)
  - List Amazon Cognito users using an AWS SDK (p. 228)
  - Resend an Amazon Cognito confirmation code using an AWS SDK (p. 230)
  - Respond to Amazon Cognito SRP authentication challenges using an AWS SDK (p. 233)
  - Respond to an Amazon Cognito authentication challenge using an AWS SDK (p. 236)
  - Sign up a user with Amazon Cognito using an AWS SDK (p. 240)
  - Start authentication with a device tracked by Amazon Cognito using an AWS SDK (p. 244)
  - Start authentication with Amazon Cognito and administrator credentials using an AWS SDK (p. 247)
  - Verify an MFA application with an Amazon Cognito user using an AWS SDK (p. 250)
- Scenarios for Amazon Cognito Identity Provider using AWS SDKs (p. 253)
  - Sign up a user with an Amazon Cognito user pool that requires MFA using an AWS SDK (p. 254)

## Actions for Amazon Cognito Identity Provider using AWS SDKs

The following code examples show how to use Amazon Cognito Identity Provider with AWS SDKs. Each example calls an individual service function.

### Examples

- Confirm an Amazon Cognito user using an AWS SDK (p. 216)
- Confirm an MFA device for tracking by Amazon Cognito using an AWS SDK (p. 219)
- Get a token to associate an MFA application with an Amazon Cognito user using an AWS SDK (p. 221)
- Get information about an Amazon Cognito user using an AWS SDK (p. 224)
- List the Amazon Cognito user pools using an AWS SDK (p. 227)
- List Amazon Cognito users using an AWS SDK (p. 228)
- Resend an Amazon Cognito confirmation code using an AWS SDK (p. 230)
- Respond to Amazon Cognito SRP authentication challenges using an AWS SDK (p. 233)
- Respond to an Amazon Cognito authentication challenge using an AWS SDK (p. 236)

- Sign up a user with Amazon Cognito using an AWS SDK (p. 240)
- Start authentication with a device tracked by Amazon Cognito using an AWS SDK (p. 244)
- Start authentication with Amazon Cognito and administrator credentials using an AWS SDK (p. 247)
- Verify an MFA application with an Amazon Cognito user using an AWS SDK (p. 250)

## Confirm an Amazon Cognito user using an AWS SDK

## Scenarios for Amazon Cognito Identity Provider using AWS SDKs

The following code examples show how to use Amazon Cognito Identity Provider with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Sign up a user with an Amazon Cognito user pool that requires MFA using an AWS SDK \(p. 254\)](#)

## Sign up a user with an Amazon Cognito user pool that requires MFA using an AWS SDK

The following code examples show how to:

- Sign up a user with a user name, password, and email address.
- Confirm the user from a code sent in email.
- Set up multi-factor authentication by associating an MFA application with the user.
- Sign in by using a password and an MFA code.

## Kotlin

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/**
```

Before running this Kotlin code example, set up your development environment, including your credentials.

For more information, see the following documentation:  
<https://docs.aws.amazon.com/sdk-for-kotlin/latest/developer-guide/setup.html>

TIP: To set up the required user pool, run the AWS Cloud Development Kit (AWS CDK) script provided in this GitHub repo at `resources/cdk/cognito_scenario_user_pool_with_mfa`.

This code example performs the following operations:

1. Invokes the `signUp` method to sign up a user.
  2. Invokes the `admin GetUser` method to get the user's confirmation status.
  3. Invokes the `ResendConfirmationCode` method if the user requested another code.
  4. Invokes the `confirmSignUp` method.
  5. Invokes the `initiateAuth` to sign in. This results in being prompted to set up TOTP (time-based one-time password). (The response is "ChallengeName": "MFA\_SETUP").
  6. Invokes the `AssociateSoftwareToken` method to generate a TOTP MFA private key. This can be used with Google Authenticator.
  7. Invokes the `VerifySoftwareToken` method to verify the TOTP and register for MFA.
  8. Invokes the `AdminInitiateAuth` to sign in again. This results in being prompted to submit a TOTP (Response: "ChallengeName": "SOFTWARE\_TOKEN\_MFA").
  9. Invokes the `AdminRespondToAuthChallenge` to get back a token.
- \*/

```

## Scenarios for Amazon Comprehend using AWS SDKs

The following code examples show how to use Amazon Comprehend with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Detect document elements with Amazon Comprehend and an AWS SDK \(p. 300\)](#)
- [Run an Amazon Comprehend topic modeling job on sample data using an AWS SDK \(p. 304\)](#)
- [Train a custom Amazon Comprehend classifier and classify documents using an AWS SDK \(p. 306\)](#)

## Detect document elements with Amazon Comprehend and an AWS SDK

The following code example shows how to:

- Detect languages in a document.
- Detect entities in a document.
- Detect key phrases in a document.
- Detect personally identifiable information (PII) in a document.
- Detect the sentiment of a document.
- Detect syntax elements in a document.

### Python

## Run an Amazon Comprehend topic modeling job on sample data using an AWS SDK

The following code example shows how to:

- Run an Amazon Comprehend topic modeling job on sample data.
- Get information about the job.
- Extract job output data from Amazon Simple Storage Service (Amazon S3).

Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a wrapper class to call Amazon Comprehend topic modeling actions.

```
class ComprehendTopicModeler:  
    """Encapsulates a Comprehend topic modeler."""  
    def __init__(self, comprehend_client):  
        """  
        :param comprehend_client: A Boto3 Comprehend client.  
        """  
        self.comprehend_client = comprehend_client  
  
    def start_job(  
        self, job_name, input_bucket, input_key, input_format, output_bucket,  
        output_key, data_access_role_arn):  
        """  
        Starts a topic modeling job. Input is read from the specified Amazon S3  
        input bucket and written to the specified output bucket. Output data is  
        stored  
        in a tar archive compressed in gzip format. The job runs asynchronously, so  
        you  
        can call `describe_topics_detection_job` to get job status until it  
        returns a status of SUCCEEDED.  
  
        :param job_name: The name of the job.  
        :param input_bucket: An Amazon S3 bucket that contains job input.  
        :param input_key: The prefix used to find input data in the input  
            bucket. If multiple objects have the same prefix, all  
            of them are used.  
        :param input_format: The format of the input data, either one document per  
            file or one document per line.  
        :param output_bucket: The Amazon S3 bucket where output data is written.  
        :param output_key: The prefix prepended to the output data.  
        :param data_access_role_arn: The Amazon Resource Name (ARN) of a role that  
            grants Comprehend permission to read from the  
            input bucket and write to the output bucket.  
        :return: Information about the job, including the job ID.  
        """  
        try:  
            response = self.comprehend_client.start_topics_detection_job(

## Cross-service examples for Amazon Comprehend using AWS SDKs

The following code examples show how to use Amazon Comprehend with AWS SDKs. Each example contains a sample application that works across multiple AWS services.

### Examples

- [Build an Amazon Transcribe streaming app \(p. 313\)](#)
- [Create an Amazon Lex Chatbot within a web application to engage your web site visitors \(p. 314\)](#)
- [Create a web application that sends and retrieves messages by using the Amazon Simple Queue Service API \(p. 315\)](#)
- [Detect entities in text extracted from an image using an AWS SDK \(p. 315\)](#)

### Build an Amazon Transcribe streaming app

The following code example shows how to build an app that records, transcribes, and translates live audio in real-time, and emails the results.

JavaScript

### SDK for JavaScript V3

Shows how to use Amazon Transcribe to build an app that records, transcribes, and translates live audio in real-time, and emails the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Comprehend
- Amazon SES
- Amazon Transcribe
- Amazon Translate

## Create an Amazon Lex Chatbot within a web application to engage your web site visitors

The following code examples show how to create a Chatbot to engage your web site visitors.

Java

### SDK for Java 2.x

Shows how to use the Amazon Lex API to create a Chatbot within a web application to engage your web site visitors.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Comprehend
- Amazon Lex
- Amazon Translate

JavaScript

### SDK for JavaScript V3

Shows how to use the Amazon Lex API to create a Chatbot within a web application to engage your web site visitors.

For complete source code and instructions on how to set up and run, see the full example [Building an Amazon Lex chatbot](#) in the AWS SDK for JavaScript developer guide.

#### Services used in this example

- Amazon Comprehend
- Amazon Lex
- Amazon Translate

## Create a web application that sends and retrieves messages by using the Amazon Simple Queue Service API

The following code examples show how to create a messaging application by using the Amazon Simple Queue Service API.

Java

### SDK for Java 2.x

Shows how to use the Amazon Simple Queue Service API to develop a Spring REST API that sends and retrieves messages.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Comprehend
- Amazon SQS

Kotlin

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

Shows how to use the Amazon Simple Queue Service API to develop a Spring REST API that sends and retrieves messages.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Comprehend
- Amazon SQS

## Detect entities in text extracted from an image using an AWS SDK

The following code example shows how to use Amazon Comprehend to detect entities in text extracted by Amazon Textract from an image that is stored in Amazon S3.

Python

### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) in a Jupyter notebook to detect entities in text that is extracted from an image. This example uses Amazon Textract to extract text from an image stored in Amazon Simple Storage Service (Amazon S3) and Amazon Comprehend to detect entities in the extracted text.

This example is a Jupyter notebook and must be run in an environment that can host notebooks. For instructions on how to run the example using Amazon SageMaker, see the directions in [TextractAndComprehendNotebook.ipynb](#).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Comprehend
- Amazon S3
- Amazon Textract

## Code examples for AWS Config using AWS SDKs

The following code examples show how to use AWS Config with an AWS software development kit (SDK).

#### Code examples

- [Actions for AWS Config using AWS SDKs \(p. 316\)](#)
  - [Delete an AWS Config rule using an AWS SDK \(p. 316\)](#)
  - [Describe AWS Config rules using an AWS SDK \(p. 317\)](#)
  - [Put an AWS Config rule using an AWS SDK \(p. 317\)](#)

## Actions for AWS Config using AWS SDKs

The following code examples show how to use AWS Config with AWS SDKs. Each example calls an individual service function.

#### Examples

- [Delete an AWS Config rule using an AWS SDK \(p. 316\)](#)
- [Describe AWS Config rules using an AWS SDK \(p. 317\)](#)
- [Put an AWS Config rule using an AWS SDK \(p. 317\)](#)

## Delete an AWS Config rule using an AWS SDK

The following code example shows how to delete an AWS Config rule.

Python

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class ConfigWrapper:  
    """  
    Encapsulates AWS Config functions.  
    """  
    def __init__(self, config_client):  
        """  
        :param config_client: A Boto3 AWS Config client.  
        """  
        self.config_client = config_client  
  
    def delete_config_rule(self, rule_name):  
        """
```

```
Delete the specified rule.

:param rule_name: The name of the rule to delete.
"""
try:
    self.config_client.delete_config_rule(ConfigRuleName=rule_name)
    logger.info("Deleted rule %s.", rule_name)
except ClientError:
    logger.exception("Couldn't delete rule %s.", rule_name)
    raise
```

- For API details, see [DeleteConfigRule](#) in *AWS SDK for Python (Boto3) API Reference*.

## Describe AWS Config rules using an AWS SDK

The following code example shows how to describe AWS Config rules.

Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class ConfigWrapper:
    """
    Encapsulates AWS Config functions.
    """
    def __init__(self, config_client):

## Actions for DynamoDB using AWS SDKs

The following code examples show how to use Amazon DynamoDB with AWS SDKs. Each example calls an individual service function.

### Examples

- Create a DynamoDB table using an AWS SDK (p. 326)
- Delete a DynamoDB table using an AWS SDK (p. 336)
- Delete an item from a DynamoDB table using an AWS SDK (p. 342)
- Get a batch of DynamoDB items using an AWS SDK (p. 350)
- Get an item from a DynamoDB table using an AWS SDK (p. 354)
- Get information about a DynamoDB table (p. 361)
- List DynamoDB tables using an AWS SDK (p. 366)
- Put an item in a DynamoDB table using an AWS SDK (p. 372)
- Query a DynamoDB table using an AWS SDK (p. 381)
- Run a PartiQL statement on a DynamoDB table using an AWS SDK (p. 393)
- Run batches of PartiQL statements on a DynamoDB table using an AWS SDK (p. 405)
- Scan a DynamoDB table using an AWS SDK (p. 422)
- Update an item in a DynamoDB table using an AWS SDK (p. 431)
- Write a batch of DynamoDB items using an AWS SDK (p. 441)

## Create a DynamoDB table using an AWS SDK

The following code examples show how to create a DynamoDB table.

.NET

### AWS SDK for .NET

Create the client.

```
// Create service client module using ES6 syntax.
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon DynamoDB service client object.
const ddbClient = new DynamoDBClient({ region: REGION });
export { ddbClient };
```

Create the table.

```
// Import required AWS SDK clients and commands for Node.js
import { CreateTableCommand } from "@aws-sdk/client-dynamodb";
import { ddbClient } from "./libs/ddbClient.js";

// Set the parameters
export const params = {
  AttributeDefinitions: [
    {
      AttributeName: "Season", //ATTRIBUTE_NAME_1
      AttributeType: "N", //ATTRIBUTE_TYPE
    },
    {
      AttributeName: "Episode", //ATTRIBUTE_NAME_2
      AttributeType: "N", //ATTRIBUTE_TYPE
    },
  ],
  KeySchema: [
    {
      AttributeName: "Season", //ATTRIBUTE_NAME_1
      KeyType: "HASH",
    },
    {
      AttributeName: "Episode", //ATTRIBUTE_NAME_2
      KeyType: "RANGE",
    },
  ],
  ProvisionedThroughput: {
    ReadCapacityUnits: 1,
    WriteCapacityUnits: 1,
  },
  TableName: "TEST_TABLE", //TABLE_NAME
  StreamSpecification: {
    StreamEnabled: false,
  },
};

export const run = async () => {
  try {
    const data = await ddbClient.send(new CreateTableCommand(params));
    console.log("Table Created", data);
    return data;
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

## JavaScript

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create the DynamoDB service client module using ES6 syntax.
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";
import { DEFAULT_REGION } from "../../../../../libs/utils/util-aws-sdk.js";
// Create an Amazon DynamoDB service client object.
export const ddbClient = new DynamoDBClient({ region: DEFAULT_REGION });
```

Create the document client.

```
// Create a service client module using ES6 syntax.
import { DynamoDBDocumentClient } from "@aws-sdk/lib-dynamodb";
import { ddbClient } from "./ddbClient.js";

const marshallOptions = {
    // Whether to automatically convert empty strings, blobs, and sets to `null`.
    convertEmptyValues: false, // false, by default.
    // Whether to remove undefined values while marshalling.
    removeUndefinedValues: true, // false, by default.
    // Whether to convert typeof object to map attribute.
    convertClassInstanceToMap: false, // false, by default.
};

const unmarshallOptions = {
    // Whether to return numbers as a string instead of converting them to native
    // JavaScript numbers.
    wrapNumbers: false, // false, by default.
};

// Create the DynamoDB document client.
const ddbDocClient = DynamoDBDocumentClient.from(ddbClient, {
    marshallOptions,
    unmarshallOptions,
});

export { ddbDocClient };
```

Delete an item from a table using the DynamoDB document client.

```
import { DeleteCommand } from "@aws-sdk/lib-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";
```

```
// Set the parameters.  
export const params = {  
  TableName: "TABLE_NAME",  
  Key: {  
    primaryKey: "VALUE_1",  
    sortKey: "VALUE_2",  
  },  
};  
  
export const deleteItem = async () => {  
  try {  
    await ddbDocClient.send(new DeleteCommand(params));  
    console.log("Success - item deleted");  
  } catch (err) {  
    console.log("Error", err);  
  }  
};  
deleteItem();
```

Delete an item from a table using PartiQL.

```
// Import required AWS SDK clients and commands for Node.js.  
import { ExecuteStatementCommand } from "@aws-sdk/client-dynamodb";  
import { ddbDocClient } from "../libs/ddbDocClient.js";  
  
const tableName = process.argv[2];  
const movieYear1 = process.argv[3];  
const movieTitle1 = process.argv[4];  
  
export const run = async (tableName, movieYear1, movieTitle1) => {  
  const params = {  
    Statement: "DELETE FROM " + tableName + " where title=? and year=?",  
    Parameters: [{ S: movieTitle1 }, { N: movieYear1 }],  
  };  
  try {  
    await ddbDocClient.send(new ExecuteStatementCommand(params));  
    console.log("Success. Item deleted.");  
    return "Run successfully"; // For unit tests.  
  } catch (err) {  
    console.error(err);  
  }  
};  
run(tableName, movieYear1, movieTitle1);
```

Delete an item from a table by batch using PartiQL.

```
// Import required AWS SDK clients and commands for Node.js.  
import { BatchExecuteStatementCommand } from "@aws-sdk/client-dynamodb";  
import { ddbDocClient } from "../libs/ddbDocClient.js";  
  
const tableName = process.argv[2];  
const movieYear1 = process.argv[3];  
const movieTitle1 = process.argv[4];  
const movieYear2 = process.argv[5];  
const movieTitle2 = process.argv[6];  
  
export const run = async (  
  tableName,  
  movieYear1,
```

```
    movieTitle1,
    movieYear2,
    movieTitle2
) => {
  try {
    const params = {
      Statements: [
        {
          Statement: "DELETE FROM " + tableName + " where year=? and title=?",
          Parameters: [{ N: movieYear1 }, { S: movieTitle1 }],
        },
        {
          Statement: "DELETE FROM " + tableName + " where year=? and title=?",
          Parameters: [{ N: movieYear2 }, { S: movieTitle2 }],
        },
      ],
    };
    const data = await ddbDocClient.send(
      new BatchExecuteStatementCommand(params)
    );
    console.log("Success. Items deleted.", data);
    return "Run successfully"; // For unit tests.
  } catch (err) {
    console.error(err);
  }
};
run(tableName, movieYear1, movieTitle1, movieYear2, movieTitle2);
```

Delete an item from a table.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create the DynamoDB service object
var ddb = new AWS.DynamoDB({apiVersion: '2012-08-10'});

var params = {
  TableName: 'TABLE',
  Key: {
    'KEY_NAME': {N: 'VALUE'}
  }
};

// Call DynamoDB to delete the item from the table
ddb.deleteItem(params, function(err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data);
  }
});
```

Delete an item from a table using the DynamoDB document client.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create DynamoDB document client
var docClient = new AWS.DynamoDB.DocumentClient({apiVersion: '2012-08-10'});

var params = {
  Key: {
    'HASH_KEY': VALUE
  },
  TableName: 'TABLE'
};

docClient.delete(params, function(err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data);
  }
});
```

Create the client.

```
// Create service client module using ES6 syntax.
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon DynamoDB service client object.
const ddbClient = new DynamoDBClient({ region: REGION });
export { ddbClient };
```

Get the items.

```
// Import required AWS SDK clients and commands for Node.js
import { BatchGetItemCommand } from "@aws-sdk/client-dynamodb";
import { ddbClient } from "./libs/ddbClient.js";

// Set the parameters
export const params = {
  RequestItems: {
    TABLE_NAME: {
      Keys: [
        {
          KEY_NAME_1: { N: "KEY_VALUE" },
          KEY_NAME_2: { N: "KEY_VALUE" },
        }
      ]
    }
  }
};
```

```
        KEY_NAME_3: { N: "KEY_VALUE" },
    },
],
ProjectionExpression: "ATTRIBUTE_NAME",
},
},
};

export const run = async () => {
try {
const data = await ddbClient.send(new BatchGetItemCommand(params));
console.log("Success, items retrieved", data);
return data;
} catch (err) {
console.log("Error", err);
}
};
run();
```

## Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Gets an item from a table by using the DynamoDbClient.

```
public static int queryTable(DynamoDbClient ddb, String tableName, String
partitionKeyName, String partitionKeyVal, String partitionAlias) {

    // Set up an alias for the partition key name in case it's a reserved word.
    HashMap<String, String> attrNameAlias = new HashMap<String, String>();
    attrNameAlias.put(partitionAlias, partitionKeyName);

    // Set up mapping of the partition name with the value.
    HashMap<String, AttributeValue> attrValues = new HashMap<>();

    attrValues.put(": "+partitionKeyName, AttributeValue.builder()
        .s(partitionKeyVal)
        .build());

    QueryRequest queryReq = QueryRequest.builder()
        .tableName(tableName)
```

```
.keyConditionExpression(partitionAlias + " = :" + partitionKeyName)
.expressionAttributeNames(attrNameAlias)
.expressionAttributeValues(attrValues)
.build();

try {
    QueryResponse response = ddb.query(queryReq);
    return response.count();
} catch (DynamoDbException e) {
    System.err.println(e.getMessage());
    System.exit(1);
}
return -1;
}
```

## JavaScript

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create the DynamoDB service client module using ES6 syntax.
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";
import { DEFAULT_REGION } from "../../libs/utils/util-aws-sdk.js";
// Create an Amazon DynamoDB service client object.
export const ddbClient = new DynamoDBClient({ region: DEFAULT_REGION });
```

Create the DynamoDB document client.

```
// Create a service client module using ES6 syntax.
import { DynamoDBDocumentClient } from "@aws-sdk/lib-dynamodb";
import { ddbClient } from "./ddbClient.js";

const marshallOptions = {
    // Whether to automatically convert empty strings, blobs, and sets to `null`.
    convertEmptyValues: false, // false, by default.
    // Whether to remove undefined values while marshalling.
    removeUndefinedValues: true, // false, by default.
    // Whether to convert typeof object to map attribute.
    convertClassInstanceToMap: false, // false, by default.
};

const unmarshallOptions = {
    // Whether to return numbers as a string instead of converting them to native
    // JavaScript numbers.
    wrapNumbers: false, // false, by default.
};

// Create the DynamoDB document client.
const ddbDocClient = DynamoDBDocumentClient.from(ddbClient, {
    marshallOptions,
    unmarshallOptions,
});
```

```
export { ddbDocClient };
```

Get an item from a table.

```
import { GetCommand } from "@aws-sdk/lib-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";

// Set the parameters.
export const params = {
  TableName: "TABLE_NAME",
  Key: {
    primaryKey: "VALUE_1",
    sortKey: "VALUE_2",
  },
};

export const getItem = async () => {
  try {
    const data = await ddbDocClient.send(new GetCommand(params));
    console.log("Success :", data.Item);
  } catch (err) {
    console.log("Error", err);
  }
};
getItem();
```

Get an item from a table using PartiQL.

```
// Import required AWS SDK clients and commands for Node.js.
import { ExecuteStatementCommand } from "@aws-sdk/client-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient";

const tableName = process.argv[2];
const movieTitle1 = process.argv[3];

export const run = async (tableName, movieTitle1) => {
  const params = {
    Statement: "SELECT * FROM " + tableName + " where title=?",
    Parameters: [{ S: movieTitle1 }],
  };
  try {
    const data = await ddbDocClient.send(new ExecuteStatementCommand(params));
    for (let i = 0; i < data.Items.length; i++) {
      console.log(
        "Success. The query return the following data. Item " + i,
        data.Items[i].year,
        data.Items[i].title,
        data.Items[i].info
      );
    }
    return "Run successfully"; // For unit tests.
  } catch (err) {
    console.error(err);
  }
};
run(tableName, movieTitle1);
```

Get items by batch from a table using PartiQL.

```
// Import required AWS SDK clients and commands for Node.js.
import { BatchExecuteStatementCommand } from "@aws-sdk/client-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";

const tableName = process.argv[2];
const movieYear1 = process.argv[3];
const movieTitle1 = process.argv[4];
const movieYear2 = process.argv[5];
const movieTitle2 = process.argv[6];

Puts an item into a table by using the enhanced client.

```
public static void putRecord(DynamoDbEnhancedClient enhancedClient) {
    try {
        DynamoDbTable<Customer> custTable = enhancedClient.table("Customer",
TableSchema.fromBean(Customer.class));

        // Create an Instant value.
        LocalDate localDate = LocalDate.parse("2020-04-07");
        LocalDateTime localDateTime = localDate.atStartOfDay();
        Instant instant = localDateTime.toInstant(ZoneOffset.UTC);

        // Populate the Table.
        Customer custRecord = new Customer();
        custRecord.setCustName("Tom red");
        custRecord.setId("id101");
        custRecord.setEmail("tred@noserver.com");
        custRecord.setRegistrationDate(instant) ;

        // Put the customer data into an Amazon DynamoDB table.
        custTable.putItem(custRecord);

    } catch (DynamoDbException e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
    System.out.println("Customer data added to the table with id id101");
}
```

## JavaScript

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create the DynamoDB service client module using ES6 syntax.  
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";  
import { DEFAULT_REGION } from "../../libs/utils/util-aws-sdk.js";  
// Create an Amazon DynamoDB service client object.  
export const ddbClient = new DynamoDBClient({ region: DEFAULT_REGION });
```

Create the DynamoDB document client.

```
// Create a service client module using ES6 syntax.  
import { DynamoDBDocumentClient } from "@aws-sdk/lib-dynamodb";  
import { ddbClient } from "./ddbClient.js";  
  
const marshallOptions = {  
    // Whether to automatically convert empty strings, blobs, and sets to `null`.  
    convertEmptyValues: false, // false, by default.  
    // Whether to remove undefined values while marshalling.  
    removeUndefinedValues: true, // false, by default.  
    // Whether to convert typeof object to map attribute.  
    convertClassInstanceToMap: false, // false, by default.  
};  
  
const unmarshallOptions = {  
    // Whether to return numbers as a string instead of converting them to native  
    // JavaScript numbers.  
    wrapNumbers: false, // false, by default.  
};  
  
// Create the DynamoDB document client.  
const ddbDocClient = DynamoDBDocumentClient.from(ddbClient, {  
    marshallOptions,  
    unmarshallOptions,  
});  
  
export { ddbDocClient };
```

Put an item in a table using the DynamoDB document client.

```
import { PutCommand } from "@aws-sdk/lib-dynamodb";  
import { ddbDocClient } from "../../libs/ddbDocClient.js";  
  
export const putItem = async () => {  
    // Set the parameters.  
    export const params = {  
        TableName: "TABLE_NAME",  
        Item: {  
            primaryKey: "VALUE_1",  
            sortKey: "VALUE_2",  
        },  
    };  
    try {
```

```
    const data = await ddbDocClient.send(new PutCommand(params));
    console.log("Success - item added or updated", data);
} catch (err) {
    console.log("Error", err.stack);
}
};

putItem();
```

Put an item in a table using PartiQL.

```
// Import required AWS SDK clients and commands for Node.js.
import { ExecuteStatementCommand } from "@aws-sdk/client-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";

const tableName = process.argv[2];
const movieYear1 = process.argv[3];
const movieTitle1 = process.argv[4];

export const run = async (tableName, movieTitle1, movieYear1) => {
    const params = {
        Statement: "INSERT INTO " + tableName + " value {'title':?, 'year':?}",
        Parameters: [{ S: movieTitle1 }, { N: movieYear1 }],
    };
    try {
        await ddbDocClient.send(new ExecuteStatementCommand(params));
        console.log("Success. Item added.");
        return "Run successfully"; // For unit tests.
    } catch (err) {
        console.error(err);
    }
};
run(tableName, movieTitle1, movieYear1);
```

Put items by batch in a table using PartiQL.

```
// Import required AWS SDK clients and commands for Node.js.
import { BatchExecuteStatementCommand } from "@aws-sdk/client-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";

const tableName = process.argv[2];
const movieYear1 = process.argv[3];
const movieTitle1 = process.argv[4];
const movieYear2 = process.argv[5];
const movieTitle2 = process.argv[6];

export const run = async (
    tableName,
    movieYear1,
    movieTitle1,
    movieYear2,
    movieTitle2
) => {
    const params = {
        Statements: [
            {
                Statement:
                    "INSERT INTO " + tableName + " value {'title':?, 'year':?}",
                Parameters: [{ S: movieTitle1 }, { N: movieYear1 }],
            },
            {

```

```
Statement:  
    "INSERT INTO " + tableName + " value {'title':?, 'year':?}",
    Parameters: [{ S: movieTitle2 }, { N: movieYear2 }],
},
],
];
try {
    await ddbDocClient.send(
        new BatchExecuteStatementCommand(params)
    );
    console.log("Success. Items added.");
    return "Run successfully"; // For unit tests.
} catch (err) {
    console.error(err);
}
};

run(tableName, movieYear1, movieTitle1, movieYear2, movieTitle2);
```

Put an item in a table.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create the DynamoDB service object
var ddb = new AWS.DynamoDB({apiVersion: '2012-08-10'});

var params = {
    TableName: 'CUSTOMER_LIST',
    Item: {
        'CUSTOMER_ID' : {N: '001'},
        'CUSTOMER_NAME' : {S: 'Richard Roe'}
    }
};

// Call DynamoDB to add the item to the table
ddb.putItem(params, function(err, data) {
    if (err) {
        console.log("Error", err);
    } else {
        console.log("Success", data);
    }
});
```

Put an item in a table using the DynamoDB document client.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create DynamoDB document client
var docClient = new AWS.DynamoDB.DocumentClient({apiVersion: '2012-08-10'});
```

```
var params = {
  TableName: 'TABLE',
  Item: {
    'HASHKEY': VALUE,
    'ATTRIBUTE_1': 'STRING_VALUE',
    'ATTRIBUTE_2': VALUE_2
  }
};

docClient.put(params, function(err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data);
  }
});
```

## Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Queries a table by using the enhanced client.

```
public static String queryTable(DynamoDbEnhancedClient enhancedClient) {

    try{
        DynamoDbTable<Customer> mappedTable = enhancedClient.table("Customer",
TableSchema.fromBean(Customer.class));
        QueryConditional queryConditional =
QueryConditional.keyEqualTo(Key.builder()
            .partitionValue("id101")
            .build());

        // Get items in the table and write out the ID value.
        Iterator<Customer> results =
mappedTable.query(queryConditional).items().iterator();
```

```

        String result="";
        while (results.hasNext()) {
            Customer rec = results.next();
            result = rec.getId();
            System.out.println("The record id is "+result);
        }
        return result;
    } catch (DynamoDbException e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
    return "";
}

```

Queries a table by using the enhanced client and a secondary index.

```

public static void queryIndex(DynamoDbClient ddb, String tableName) {
    try {
        // Create a DynamoDbEnhancedClient and use the DynamoDbClient object.
        DynamoDbEnhancedClient enhancedClient =
DynamoDbEnhancedClient.builder()
        .dynamoDbClient(ddb)
        .build();

        //Create a DynamoDbTable object based on Movies.
        DynamoDbTable<Movies> table = enhancedClient.table("Movies",
TableSchema.fromBean(Movies.class));
        String dateVal = "2013";

        DynamoDbIndex<Movies> secIndex = enhancedClient.table("Movies",
TableSchema.fromBean(Movies.class)).index("year-index");
        AttributeValue attVal = AttributeValue.builder()
        .n(dateVal)
        .build();

        // Create a QueryConditional object that's used in the query operation.
        QueryConditional queryConditional = QueryConditional
        .keyEqualTo(Key.builder().partitionValue(attVal)
        .build());

        // Get items in the table.
        SdkIterable<Page<Movies>> results =
secIndex.query(QueryEnhancedRequest.builder()
        .queryConditional(queryConditional)
        .limit(300)
        .build());

        // Display the results.
        results.forEach(page -> {
            List<Movies> allMovies = page.items();
            for (Movies myMovies: allMovies) {
                System.out.println("The movie title is " + myMovies.getTitle()
+ ". The year is " + myMovies.getYear());
            }
        });

        } catch (DynamoDbException e) {
            System.err.println(e.getMessage());
            System.exit(1);
        }
    }
}

```

Queries a table by using the DynamoDbClient.

```
public static int queryTable(DynamoDbClient ddb, String tableName, String partitionKeyName, String partitionKeyVal, String partitionAlias) {

    // Set up an alias for the partition key name in case it's a reserved word.
    HashMap<String, String> attrNameAlias = new HashMap<String, String>();
    attrNameAlias.put(partitionAlias, partitionKeyName);

    // Set up mapping of the partition name with the value.
    HashMap<String, AttributeValue> attrValues = new HashMap<>();

    attrValues.put(":" + partitionKeyName, AttributeValue.builder()
        .s(partitionKeyVal)
        .build());

    QueryRequest queryReq = QueryRequest.builder()
        .tableName(tableName)
        .keyConditionExpression(partitionAlias + " = :" + partitionKeyName)
        .expressionAttributeNames(attrNameAlias)
        .expressionAttributeValues(attrValues)
        .build();

    try {
        QueryResponse response = ddb.query(queryReq);
        return response.count();

    } catch (DynamoDbException e) {
        System.err.println(e.getMessage());
        System.exit(1);
    }
    return -1;
}
```

Queries a table by using the DynamoDbClient and a secondary index.

```
public static void queryIndex(DynamoDbClient ddb, String tableName) {

    try {
        Map<String, String> expressionAttributesNames = new HashMap<>();
        expressionAttributesNames.put("#year", "year");
        Map<String, AttributeValue> expressionAttributeValues = new
HashMap<>();
        expressionAttributeValues.put(":yearValue",
        AttributeValue.builder().n("2013").build());

        QueryRequest request = QueryRequest.builder()
            .tableName(tableName)
            .indexName("year-index")
            .keyConditionExpression("#year = :yearValue")
            .expressionAttributeNames(expressionAttributesNames)
            .expressionAttributeValues(expressionAttributeValues)
            .build();

        System.out.println("== Movie Titles ==");
        QueryResponse response = ddb.query(request);
        response.items()
            .forEach(movie -> System.out.println(movie.get("title").s()));

    } catch (DynamoDbException e) {
```

```
        System.err.println(e.getMessage());
        System.exit(1);
    }
}
```

Create the client.

```
// Create service client module using ES6 syntax.
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon DynamoDB service client object.
const ddbClient = new DynamoDBClient({ region: REGION });
export { ddbClient };
```

Query the table.

```
// Import required AWS SDK clients and commands for Node.js
import { QueryCommand } from "@aws-sdk/client-dynamodb";
import { ddbClient } from "./libs/ddbClient.js";

// Set the parameters
export const params = {
  KeyConditionExpression: "Season = :s and Episode > :e",
  FilterExpression: "contains (Subtitle, :topic)",
  ExpressionAttributeValues: {
    ":s": { N: "1" },
    ":e": { N: "2" },
    ":topic": { S: "SubTitle" },
  },
  ProjectionExpression: "Episode, Title, Subtitle",
  TableName: "EPISODES_TABLE",
};

export const run = async () => {
  try {
    const data = await ddbClient.send(new QueryCommand(params));
    data.Items.forEach(function (element) {
      console.log(element.Title.S + (" " + element.Subtitle.S + ")");
    });
    return data;
  } catch (err) {
    console.error(err);
  }
};
run();
```

Create the client for the DynamoDB document client.

```
// Create service client module using ES6 syntax.
import { DynamoDBDocumentClient } from "@aws-sdk/lib-dynamodb";
import { ddbClient } from "./ddbClient";

const marshallOptions = {
    // Whether to automatically convert empty strings, blobs, and sets to `null`.
    convertEmptyValues: false, // false, by default.
    // Whether to remove undefined values while marshalling.
    removeUndefinedValues: false, // false, by default.
    // Whether to convert typeof object to map attribute.
    convertClassInstanceToMap: false, // false, by default.
};

const unmarshallOptions = {
    // Whether to return numbers as a string instead of converting them to native
    // JavaScript numbers.
    wrapNumbers: false, // false, by default.
};

const translateConfig = { marshallOptions, unmarshallOptions };

// Create the DynamoDB Document client.
const ddbDocClient = DynamoDBDocumentClient.from(ddbClient, translateConfig);

export { ddbDocClient };
```

Query the table using the DynamoDB document client.

```
import { QueryCommand } from "@aws-sdk/lib-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";

// Set the parameters.
export const params = {
    ExpressionAttributeNames: { "#r": "rank", "#y": "year" },
    ProjectionExpression: "#r, #y, title",
    TableName: "TABLE_NAME",
    ExpressionAttributeValues: {
        ":t": "MOVIE_NAME",
        ":y": "MOVIE_YEAR",
        ":r": "MOVIE_RANK",
    },
    KeyConditionExpression: "title = :t and #y = :y",
    FilterExpression: "info.#r = :r",
};

export const queryTable = async () => {
    try {
        const data = await ddbDocClient.send(new QueryCommand(params));
        for (let i = 0; i < data.Items.length; i++) {
            console.log(
                "Success. Items with rank of " +
                "MOVIE_RANK" +
                " include\n" +
                "Year = " +
                data.Items[i].year +
                " Title = " +
                data.Items[i].title
            );
        }
    } catch (err) {
        console.log("Error", err);
    }
};
```

```
queryTable();

## Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Query items by using a key condition expression.

```
class Movies:
    """Encapsulates an Amazon DynamoDB table of movie data."""
    def __init__(self, dyn_resource):
        """
        :param dyn_resource: A Boto3 DynamoDB resource.
        """
        self.dyn_resource = dyn_resource
        self.table = None

    def query_movies(self, year):
        """
        Queries for movies that were released in the specified year.

        :param year: The year to query.
        :return: The list of movies that were released in the specified year.
        """
        try:
            response =
self.table.query(KeyConditionExpression=Key('year').eq(year))
        except ClientError as err:
            logger.error(
                "Couldn't query for movies released in %s. Here's why: %s: %s",
year,
                err.response['Error']['Code'], err.response['Error']['Message'])
            raise
        else:
            return response['Items']
```

Query items and project them to return a subset of data.

```
class UpdateQueryWrapper:
    def __init__(self, table):
        self.table = table

    def query_and_project_movies(self, year, title_bounds):
        """
        Query for movies that were released in a specified year and that have
titles
        that start within a range of letters. A projection expression is used
        to return a subset of data for each movie.

        :param year: The release year to query.
        :param title_bounds: The range of starting letters to query.
        :return: The list of movies.
        """

```

```
try:

## Rust

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Find the movies made in the specified year.

```
pub async fn movies_in_year(
    client: &Client,
    table_name: &str,
    year: u16,
) -> Result<Vec<Movie>, MovieError> {
    let results = client
        .query()
        .table_name(table_name)
        .key_condition_expression("#yr = :yyyy")
        .expression_attribute_names("#yr", "year")
        .expression_attribute_values(":yyyy", AttributeValue::N(year.to_string()))
        .send()
        .await?;

    if let Some(items) = results.items {
        let movies = items.iter().map(|v| v.into()).collect();
        Ok(movies)
    } else {
        Ok(vec![])
    }
}
```

- For API details, see [Query](#) in *AWS SDK for Rust API reference*.

## Run a PartiQL statement on a DynamoDB table using an AWS SDK

The following code examples show how to run a PartiQL statement on a DynamoDB table.

### .NET

#### AWS SDK for .NET

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Use an INSERT statement to add an item.

```
/// <summary>
/// Inserts a single movie into the movies table.
/// </summary>
/// <param name="tableName">The name of the table.</param>
/// <param name="movieTitle">The title of the movie to insert.</param>
/// <param name="year">The year that the movie was released.</param>
/// <returns>A Boolean value that indicates the success or failure of
/// the INSERT operation.</returns>
public static async Task<bool> InsertSingleMovie(string tableName, string
movieTitle, int year)
{
    string insertBatch = $"INSERT INTO {tableName} VALUE {{'title': ?, 'year': ?}}";
```

```
var response = await Client.ExecuteStatementAsync(new
ExecuteStatementRequest
{
    Statement = insertBatch,
    Parameters = new List<AttributeValue>
    {
        new AttributeValue { S = movieTitle },
        new AttributeValue { N = year.ToString() },
    },
});
return response.HttpStatusCode == System.Net.HttpStatusCode.OK;
}
```

Use a SELECT statement to get an item.

```
/// <summary>
/// Uses a PartiQL SELECT statement to retrieve a single movie from the
/// movie database.
/// </summary>
/// <param name="tableName">The name of the movie table.</param>
/// <param name="movieTitle">The title of the movie to retrieve.</param>
/// <returns>A list of movie data. If no movie matches the supplied
/// title, the list is empty.</returns>
public static async Task<List<Dictionary<string, AttributeValue>>>
GetSingleMovie(string tableName, string movieTitle)
{
    string selectSingle = $"SELECT * FROM {tableName} WHERE title = ?";
    var parameters = new List<AttributeValue>
    {
        new AttributeValue { S = movieTitle },
    };

    var response = await Client.ExecuteStatementAsync(new
ExecuteStatementRequest
{
    Statement = selectSingle,
    Parameters = parameters,
});
return response.Items;
}
```

Use a SELECT statement to get a list of items.

```
/// <summary>
/// Retrieve multiple movies by year using a SELECT statement.
/// </summary>
/// <param name="tableName">The name of the movie table.</param>
/// <param name="year">The year the movies were released.</param>
/// <returns></returns>
public static async Task<List<Dictionary<string, AttributeValue>>>
GetMovies(string tableName, int year)
{
    string selectSingle = $"SELECT * FROM {tableName} WHERE year = ?";
    var parameters = new List<AttributeValue>
    {
```

```

        new AttributeValue { N = year.ToString() },
    };

    var response = await Client.ExecuteStatementAsync(new
ExecuteStatementRequest
{
    Statement = selectSingle,
    Parameters = parameters,
});

return response.Items;
}

```

Use an UPDATE statement to update an item.

```

///<summary>
/// Updates a single movie in the table, adding information for the
/// producer.
///</summary>
///<param name="tableName">the name of the table.</param>
///<param name="producer">The name of the producer.</param>
///<param name="movieTitle">The movie title.</param>
///<param name="year">The year the movie was released.</param>
///<returns>A Boolean value that indicates the success of the
/// UPDATE operation.</returns>
public static async Task<bool> UpdateSingleMovie(string tableName, string
producer, string movieTitle, int year)
{
    string insertSingle = $"UPDATE {tableName} SET Producer=? WHERE title
= ? AND year = ?";

    var response = await Client.ExecuteStatementAsync(new
ExecuteStatementRequest
{
    Statement = insertSingle,
    Parameters = new List<AttributeValue>
    {
        new AttributeValue { S = producer },
        new AttributeValue { S = movieTitle },
        new AttributeValue { N = year.ToString() },
    },
});
    return response.StatusCode == System.Net.HttpStatusCode.OK;
}

```

Use a DELETE statement to delete a single movie.

```

///<summary>
/// Deletes a single movie from the table.
///</summary>
///<param name="tableName">The name of the table.</param>
///<param name="movieTitle">The title of the movie to delete.</param>
///<param name="year">The year that the movie was released.</param>
///<returns>A Boolean value that indicates the success of the
/// DELETE operation.</returns>
public static async Task<bool> DeleteSingleMovie(string tableName, string
movieTitle, int year)
{

```

```
        var deleteSingle = $"DELETE FROM {tableName} WHERE title = ? AND year = ?";  
  
        var response = await Client.ExecuteStatementAsync(new ExecuteStatementRequest  
        {  
            Statement = deleteSingle,  
            Parameters = new List<AttributeValue>  
            {  
                new AttributeValue { S = movieTitle },  
                new AttributeValue { N = year.ToString() },  
            },  
        });  
  
        return response.HttpStatusCode == System.Net.HttpStatusCode.OK;  
    }  
  
}
```

- For API details, see [ExecuteStatement](#) in *AWS SDK for .NET API Reference*.

## C++

### SDK for C++

#### Note

        << outcome.GetError().GetMessage() << std::endl;
        return false;
    }
    else {
        // Print the retrieved movie information.
        const Aws::DynamoDB::Model::ExecuteStatementResult &result =
outcome.GetResult();

        const Aws::Vector<Aws::Map<Aws::String,
Aws::DynamoDB::Model::AttributeValue>> &items = result.GetItems();

        if (items.size() == 1) {
            printMovieInfo(items[0]);
        }
        else {
            std::cerr << "Error: " << items.size() << " movies were retrieved.
        }
    }
}
}

```

```
        << " There should be only one movie." << std::endl;
    }
}
```

Use an UPDATE statement to update an item.

```

// 4. Update the data for the movie using an "Update" statement.
(ExecuteStatement)
{
    rating = askQuestionForFloatRange(
        Aws::String("\nLet's update your movie.\nYou rated it ") +
        std::to_string(rating)
        + ", what new rating would you give it? ", 1, 10);

    Aws::DynamoDB::Model::ExecuteStatementRequest request;
    std::stringstream sqlStream;
    sqlStream << "UPDATE \""
        << MOVIE_TABLE_NAME << "\" SET "
        << INFO_KEY << "."
        << RATING_KEY << "=? WHERE "
        << TITLE_KEY << "=? AND "
        << YEAR_KEY << "=?";

    request.SetStatement(sqlStream.str());

    Aws::Vector<Aws::DynamoDB::Model::AttributeValue> attributes;
    attributes.push_back(Aws::DynamoDB::Model::AttributeValue().SetN(rating));
    attributes.push_back(Aws::DynamoDB::Model::AttributeValue().SetS(title));
    attributes.push_back(Aws::DynamoDB::Model::AttributeValue().SetN(year));

    request.SetParameters(attributes);

    Aws::DynamoDB::Model::ExecuteStatementOutcome outcome =
dynamoClient.ExecuteStatement(
        request);

    if (!outcome.IsSuccess()) {
        std::cerr << "Failed to update a movie: "
            << outcome.GetError().GetMessage();
        return false;
    }
}

```

Use a **DELETE** statement to delete an item.

```
// 6. Delete the movie using a "Delete" statement. (ExecuteStatement)
{
    Aws::DynamoDB::Model::ExecuteStatementRequest request;
    std::stringstream sqlStream;
    sqlStream << "DELETE FROM `"
        << MOVIE_TABLE_NAME << "` WHERE "
        << TITLE_KEY << "=? and "
        << YEAR_KEY << "=?";

    request.SetStatement(sqlStream.str());

    Aws::Vector<Aws::DynamoDB::Model::AttributeValue> attributes;
    attributes.push_back(Aws::DynamoDB::Model::AttributeValue().SetS(title));
    attributes.push_back(Aws::DynamoDB::Model::AttributeValue().SetN(year));
    request.SetParameters(attributes);

    Aws::DynamoDB::Model::ExecuteStatementOutcome outcome =
dynamoClient.ExecuteStatement(
        request);
    if (!outcome.IsSuccess()) {
```

```
        std::cerr << "Failed to delete the movie: "
        << outcome.GetError().GetMessage() << std::endl;
    return false;
}
}
```

Go

## SDK for Go V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Use an INSERT statement to add an item.

```
// AddMovie runs a PartiQL INSERT statement to add a movie to the DynamoDB table.
func (runner PartiQLRunner) AddMovie(movie Movie) error {
    params, err := attributevalue.MarshalList([]interface{}{movie.Title, movie.Year,
    movie.Info})
    if err != nil {
        panic(err)
    }
    _, err = runner.DynamoDbClient.ExecuteStatement(context.TODO(),
    &dynamodb.ExecuteStatementInput{
        Statement: aws.String(
            fmt.Sprintf("INSERT INTO \"%v\" VALUE {'title': ?, 'year': ?, 'info': ?}",
            runner.TableName)),
        Parameters: params,
    })
    if err != nil {
        log.Printf("Couldn't insert an item with PartiQL. Here's why: %v\n", err)
    }
    return err
}
```

Use a SELECT statement to get an item.

```
// GetMovie runs a PartiQL SELECT statement to get a movie from the DynamoDB table
// by
// title and year.
func (runner PartiQLRunner) GetMovie(title string, year int) (Movie, error) {
    var movie Movie
    params, err := attributevalue.MarshalList([]interface{}{title, year})
    if err != nil {
        panic(err)
    }
    response, err := runner.DynamoDbClient.ExecuteStatement(context.TODO(),
    &dynamodb.ExecuteStatementInput{
        Statement: aws.String(
            fmt.Sprintf("SELECT * FROM \"%v\" WHERE title=? AND year=?",
            runner.TableName)),
        Parameters: params,
    ))
    if err != nil {
```

```
    log.Printf("Couldn't get info about %v. Here's why: %v\n", title, err)
} else {
    err = attributevalue.UnmarshalMap(response.Items[0], &movie)
    if err != nil {
        log.Printf("Couldn't unmarshal response. Here's why: %v\n", err)
    }
}
return movie, err
}
```

Use a SELECT statement to get a list of items and project the results.

```
// GetAllMovies runs a PartiQL SELECT statement to get all movies from the DynamoDB
// table.
// The results are projected to return only the title and rating of each movie.
func (runner PartiQLRunner) GetAllMovies() ([]map[string]interface{}, error) {
    var output []map[string]interface{}
    response, err := runner.DynamoDbClient.ExecuteStatement(context.TODO(),
    &dynamodb.ExecuteStatementInput{
        Statement: aws.String(
            fmt.Sprintf("SELECT title, info.rating FROM \"%v\"", runner.TableName)),
    })
    if err != nil {
        log.Printf("Couldn't get movies. Here's why: %v\n", err)
    } else {
        err = attributevalue.UnmarshalListOfMaps(response.Items, &output)
        if err != nil {
            log.Printf("Couldn't unmarshal response. Here's why: %v\n", err)
        }
    }
    return output, err
}
```

Use an UPDATE statement to update an item.

```
// UpdateMovie runs a PartiQL UPDATE statement to update the rating of a movie that
// already exists in the DynamoDB table.
func (runner PartiQLRunner) UpdateMovie(movie Movie, rating float64) error {
    params, err := attributevalue.MarshalList([]interface{}{rating, movie.Title,
    movie.Year})
    if err != nil {
        panic(err)
    }
    _, err = runner.DynamoDbClient.ExecuteStatement(context.TODO(),
    &dynamodb.ExecuteStatementInput{
        Statement: aws.String(
            fmt.Sprintf("UPDATE \"%v\" SET info.rating=? WHERE title=? AND year=?",
            runner.TableName)),
        Parameters: params,
    })
    if err != nil {
        log.Printf("Couldn't update movie %v. Here's why: %v\n", movie.Title, err)
    }
    return err
}
```

Use a `DELETE` statement to delete an item.

```
// DeleteMovie runs a PartiQL DELETE statement to remove a movie from the DynamoDB table.
func (runner PartiQLRunner) DeleteMovie(movie Movie) error {
    params, err := attributevalue.MarshalList([]interface{}{movie.Title, movie.Year})
    if err != nil {
        panic(err)
    }
    _, err = runner.DynamoDbClient.ExecuteStatement(context.TODO(),
        &dynamodb.ExecuteStatementInput{
            Statement: aws.String(
                fmt.Sprintf("DELETE FROM \"%v\" WHERE title=? AND year=?",
                    runner.TableName)),
            Parameters: params,
        })
    if err != nil {
        log.Printf("Couldn't delete %v from the table. Here's why: %v\n", movie.Title,
            err)
    }
    return err
}
```

## JavaScript

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create the DynamoDB service client module using ES6 syntax.
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";
// Set the AWS Region.
export const REGION = "eu-west-1"; // For example, "us-east-1".
// Create an Amazon DynamoDB service client object.
export const ddbClient = new DynamoDBClient({ region: REGION });
```

Create the DynamoDB document client.

```
// Create a service client module using ES6 syntax.
import { DynamoDBDocumentClient } from "@aws-sdk/lib-dynamodb";
import { ddbClient } from "./ddbClient.js";

const marshallOptions = {
    // Whether to automatically convert empty strings, blobs, and sets to `null`.
    convertEmptyValues: false, // false, by default.
    // Whether to remove undefined values while marshalling.
    removeUndefinedValues: false, // false, by default.
    // Whether to convert typeof object to map attribute.
    convertClassInstanceToMap: false, // false, by default.
};
```

```
const unmarshallOptions = {
    // Whether to return numbers as a string instead of converting them to native
    // JavaScript numbers.
    wrapNumbers: false, // false, by default.
};

const translateConfig = { marshallOptions, unmarshallOptions };

// Create the DynamoDB document client.
const ddbDocClient = DynamoDBDocumentClient.from(ddbClient, translateConfig);

export { ddbDocClient };
```

Create an item using PartiQL.

```
// Import required AWS SDK clients and commands for Node.js.
import { ExecuteStatementCommand } from "@aws-sdk/client-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";

const tableName = process.argv[2];
const movieYear1 = process.argv[3];
const movieTitle1 = process.argv[4];

export const run = async (tableName, movieTitle1, movieYear1) => {
    const params = {
        Statement: "INSERT INTO " + tableName + " value {'title':?, 'year':?}",
        Parameters: [{ S: movieTitle1 }, { N: movieYear1 }],
    };
    try {
        await ddbDocClient.send(new ExecuteStatementCommand(params));
        console.log("Success. Item added.");
        return "Run successfully"; // For unit tests.
    } catch (err) {
        console.error(err);
    }
}
run(tableName, movieTitle1, movieYear1);
```

Get an item using PartiQL.

```
// Import required AWS SDK clients and commands for Node.js.
import { ExecuteStatementCommand } from "@aws-sdk/client-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient";

const tableName = process.argv[2];
const movieTitle1 = process.argv[3];

export const run = async (tableName, movieTitle1) => {
    const params = {
        Statement: "SELECT * FROM " + tableName + " where title=?",
        Parameters: [{ S: movieTitle1 }],
    };
    try {
        const data = await ddbDocClient.send(new ExecuteStatementCommand(params));
        for (let i = 0; i < data.Items.length; i++) {
            console.log(
                "Success. The query return the following data. Item " + i,
                data.Items[i].year,
                data.Items[i].title,
                data.Items[i].info
            );
        }
    } catch (err) {
        console.error(err);
    }

## Run batches of PartiQL statements on a DynamoDB table using an AWS SDK

The following code examples show how to run batches of PartiQL statements on a DynamoDB table.

### .NET

#### AWS SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Use batches of INSERT statements to add items.

```
///<summary>\n///\n///</summary>
```

```

    ///<param name="tableName"></param>
    ///<param name="title1"></param>
    ///<param name="title2"></param>
    ///<param name="year1"></param>
    ///<param name="year2"></param>
    ///<returns></returns>
    public static async Task<bool> GetBatch(
        string tableName,
        string title1,
        string title2,
        int year1,
        int year2)
    {
        var getBatch = $"SELECT FROM {tableName} WHERE title = ? AND year = ?";
        var statements = new List<BatchStatementRequest>
        {
            new BatchStatementRequest
            {
                Statement = getBatch,
                Parameters = new List<AttributeValue>
                {
                    new AttributeValue { S = title1 },
                    new AttributeValue { N = year1.ToString() },
                },
            },
            new BatchStatementRequest
            {
                Statement = getBatch,
                Parameters = new List<AttributeValue>
                {
                    new AttributeValue { S = title2 },
                    new AttributeValue { N = year2.ToString() },
                },
            }
        };

        var response = await Client.BatchExecuteStatementAsync(new
        BatchExecuteStatementRequest
        {
            Statements = statements,
        });

        if (response.Responses.Count > 0)
        {
            response.Responses.ForEach(r =>
            {
                Console.WriteLine($"{r.Item["title"]}\t{r.Item["year"]}");
            });
            return true;
        }
        else
        {
            Console.WriteLine($"Couldn't find either {title1} or {title2}.");
            return false;
        }
    }
}

```

Use batches of SELECT statements to get items.

```
//<summary>
```

```

    ///> Summary: Inserts movies imported from a JSON file into the movie table by
    ///> using an Amazon DynamoDB PartiQL INSERT statement.
    ///>
    ///> Parameters:
    ///>   <param name="tableName">The name of the table into which the movie
    ///> information will be inserted.</param>
    ///>   <param name="movieFileName">The name of the JSON file that contains
    ///> movie information.</param>
    ///> Returns: A Boolean value that indicates the success or failure of
    ///> the insert operation.
    public static async Task<bool> InsertMovies(string tableName, string
movieFileName)
    {
        // Get the list of movies from the JSON file.
        var movies = ImportMovies(movieFileName);

        var success = false;

        if (movies is not null)
        {
            // Insert the movies in a batch using PartiQL. Because the
            // batch can contain a maximum of 25 items, insert 25 movies
            // at a time.
            string insertBatch = $"INSERT INTO {tableName} VALUE {{'title': ?, 'year': ?}}";
            var statements = new List<BatchStatementRequest>();

            try
            {
                for (var indexOffset = 0; indexOffset < 250; indexOffset += 25)

## Scan a DynamoDB table using an AWS SDK

The following code examples show how to scan a DynamoDB table.

.NET

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```

public static async Task<int> ScanTableAsync(
    AmazonDynamoDBClient client,
    string tableName,
    int startYear,
    int endYear)
{
    var request = new ScanRequest
    {
        TableName = tableName,
        ExpressionAttributeNames = new Dictionary<string, string>
        {
            { "#yr", "year" },
        },
        ExpressionAttributeValues = new Dictionary<string, AttributeValue>

```

```
{  
    { ":y_a", new AttributeValue { N = startYear.ToString() } },  
    { ":y_z", new AttributeValue { N = endYear.ToString() } },  
},  
FilterExpression = "#yr between :y_a and :y_z",  
ProjectionExpression = "#yr, title, info.actors[0], info.directors,  
info.running_time_secs",  
};  
  
// Keep track of how many movies were found.  
int foundCount = 0;  
  
var response = new ScanResponse();  
do  
{  
    response = await client.ScanAsync(request);  
    foundCount += response.Items.Count;  
    response.Items.ForEach(i => DisplayItem(i));  
}  
while (response.LastEvaluatedKey.Count > 1);  
return foundCount;  
}
```

## JavaScript

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create the DynamoDB service client module using ES6 syntax.
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";
import { DEFAULT_REGION } from "../../libs/utils/util-aws-sdk.js";
// Create an Amazon DynamoDB service client object.
```

```
export const ddbClient = new DynamoDBClient({ region: DEFAULT_REGION });
```

Create the DynamoDB document client.

```
// Create a service client module using ES6 syntax.
import { DynamoDBDocumentClient } from "@aws-sdk/lib-dynamodb";
import { ddbClient } from "./ddbClient.js";

const marshallOptions = {
    // Whether to automatically convert empty strings, blobs, and sets to `null`.
    convertEmptyValues: false, // false, by default.
    // Whether to remove undefined values while marshalling.
    removeUndefinedValues: true, // false, by default.
    // Whether to convert typeof object to map attribute.
    convertClassInstanceToMap: false, // false, by default.
};

const unmarshallOptions = {
    // Whether to return numbers as a string instead of converting them to native
    // JavaScript numbers.
    wrapNumbers: false, // false, by default.
};

// Create the DynamoDB document client.
const ddbDocClient = DynamoDBDocumentClient.from(ddbClient, {
    marshallOptions,
    unmarshallOptions,
});

export { ddbDocClient };
```

Update an item in a table using the DynamoDB document client.

```
import { UpdateCommand } from "@aws-sdk/lib-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";

export const updateItem = async () => {
    // Set the parameters.
    const params = {
        TableName: "TABLE_NAME",
        Key: {
            title: "MOVIE_NAME",
            year: "MOVIE_YEAR",
        },
        ProjectionExpression: "#r",
        ExpressionAttributeNames: { "#r": "rank" },
        UpdateExpression: "set info.plot = :p, info.#r = :r",
        ExpressionAttributeValues: {
            ":p": "MOVIE_PLOT",
            ":r": "MOVIE_RANK",
        },
    };
    try {
        const data = await ddbDocClient.send(new UpdateCommand(params));
        console.log("Success - item added or updated", data);
        return data;
    } catch (err) {
        console.log("Error", err);
    }
};
```

```
updateItem();
```

Update an item in a table using PartiQL.

```
// Import required AWS SDK clients and commands for Node.js.
import { ExecuteStatementCommand } from "@aws-sdk/client-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";

const tableName = process.argv[2];
const movieYear1 = process.argv[3];
const movieTitle1 = process.argv[4];
const producer1 = process.argv[5];

export const run = async (tableName, movieYear1, movieTitle1, producer1) => {
  const params = {
    Statement:
      "UPDATE " + tableName + " SET Producer=? where title=? and year=?",
    Parameters: [{ S: producer1 }, { S: movieTitle1 }, { N: movieYear1 }],
  };
  try {
    await ddbDocClient.send(new ExecuteStatementCommand(params));
    console.log("Success. Item updated.");
    return "Run successfully"; // For unit tests.
  } catch (err) {
    console.error(err);
  }
};
run(tableName, movieYear1, movieTitle1, producer1);
```

Update items by batch in a table using PartiQL.

```
// Import required AWS SDK clients and commands for Node.js.
import { BatchExecuteStatementCommand } from "@aws-sdk/client-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";

const tableName = process.argv[2];
const movieYear1 = process.argv[3];
const movieTitle1 = process.argv[4];
const movieYear2 = process.argv[6];
const movieTitle2 = process.argv[7];
const producer1 = process.argv[5];
const producer2 = process.argv[8];

export const run = async (
  tableName,
  movieYear1,
  movieTitle1,
  movieYear2,
  movieTitle2,
  producer1,
  producer2
) => {
  const params = {
    Statements: [
      {
        Statement:
          "UPDATE " + tableName + " SET producer=? where title=? and year=?",
        Parameters: [{ S: producer1 }, { S: movieTitle1 }, { N: movieYear1 }],
      },
    ],
  };
}
```

```
{  
    Statement:  
        "UPDATE " + tableName + " SET producer=? where title=? and year=?",  
        Parameters: [{ S: producer2 }, { S: movieTitle2 }, { N: movieYear2 }],  
    },  
},  
];  
try {  
    await ddbDocClient.send(  
        new BatchExecuteStatementCommand(params)  
    );  
    console.log("Success. Items updated.");  
    return "Run successfully"; // For unit tests.  
} catch (err) {  
    console.error(err);  
}  
};  
run(  
    tableName,  
    movieYear1,  
    movieTitle1,  
    movieYear2,  
    movieTitle2,  
    producer1,  
    producer2  
);
```

## Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Update an item by using an update expression.

```
class Movies:
    """Encapsulates an Amazon DynamoDB table of movie data."""
    def __init__(self, dyn_resource):
        """
        :param dyn_resource: A Boto3 DynamoDB resource.
        """
        self.dyn_resource = dyn_resource
        self.table = None

    def update_movie(self, title, year, rating, plot):
        """
        Updates rating and plot data for a movie in the table.

        :param title: The title of the movie to update.
        :param year: The release year of the movie to update.
        :param rating: The updated rating to give the movie.
        :param plot: The updated plot summary to give the movie.
        :return: The fields that were updated, with their new values.
        """
        try:
            response = self.table.update_item(
                Key={'year': year, 'title': title},
                UpdateExpression="set info.rating=:r, info.plot=:p",
                ExpressionAttributeValues={
                    ':r': Decimal(str(rating)),
                    ':p': plot,
                },
                ReturnValues="UPDATED_NEW")
        except ClientError as err:
            logger.error(
                "Couldn't update movie %s in table %s. Here's why: %s: %s",
                title, self.table.name,
                err.response['Error']['Code'], err.response['Error']['Message'])
            raise
        else:
            return response['Attributes']
```

Update an item by using an update expression that includes an arithmetic operation.

```
class UpdateQueryWrapper:
    def __init__(self, table):
        self.table = table

    def update_rating(self, title, year, rating_change):
        """
        Updates the quality rating of a movie in the table by using an arithmetic
        operation in the update expression. By specifying an arithmetic operation,
        you can adjust a value in a single request, rather than first getting its
        value and then setting its new value.

        :param title: The title of the movie to update.
        :param year: The release year of the movie to update.
        :param rating_change: The amount to add to the current rating for the
        movie.
        :return: The updated rating.
        """
        try:
            response = self.table.update_item(
                Key={'year': year, 'title': title},
                UpdateExpression="set info.rating = info.rating + :val",
                ExpressionAttributeValues={':val': Decimal(str(rating_change))},
                ReturnValues="UPDATED_NEW")
        except ClientError as err:
```

```
logger.error(
    "Couldn't update movie %s in table %s. Here's why: %s: %s",
    title, self.table.name,
    err.response['Error']['Code'], err.response['Error']['Message'])
raise
else:
    return response['Attributes']
```

Update an item only when it meets certain conditions.

```
class UpdateQueryWrapper:
    def __init__(self, table):
        self.table = table

    def remove_actors(self, title, year, actor_threshold):
        """
        Removes an actor from a movie, but only when the number of actors is
        greater than a specified threshold. If the movie does not list more than the
        threshold, no actors are removed.

        :param title: The title of the movie to update.

## Write a batch of DynamoDB items using an AWS SDK

The following code examples show how to write a batch of DynamoDB items.

### .NET

#### AWS SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Writes a batch of items to the movie table.

```
/// <summary>
/// Loads the contents of a JSON file into a list of movies to be
/// added to the DynamoDB table.
/// </summary>
/// <param name="movieFileName">The full path to the JSON file.</param>
/// <returns>A generic list of movie objects.</returns>
public static List<Movie> ImportMovies(string movieFileName)
{
    if (!File.Exists(movieFileName))
    {
        return null;
    }

    using var sr = new StreamReader(movieFileName);
    string json = sr.ReadToEnd();
    var allMovies = JsonConvert.DeserializeObject<List<Movie>>(json);

    // Now return the first 250 entries.
    return allMovies.GetRange(0, 250);
}

/// <summary>
/// Writes 250 items to the movie table.
/// </summary>
/// <param name="client">The initialized DynamoDB client object.</param>
/// <param name="movieFileName">A string containing the full path to
```

```
    ///> the JSON file containing movie data.</param>
    ///> <returns>A long integer value representing the number of movies
    ///> imported from the JSON file.</returns>
    public static async Task<long> BatchWriteItemsAsync(
        AmazonDynamoDBClient client,
        string movieFileName)
    {
        var movies = ImportMovies(movieFileName);
        if (movies is null)
        {
            Console.WriteLine("Couldn't find the JSON file with movie data.");
            return 0;
        }

        var context = new DynamoDBContext(client);

        var bookBatch = context.CreateBatchWrite<Movie>();
        bookBatch.AddPutItems(movies);

        Console.WriteLine("Adding imported movies to the table.");
        await bookBatch.ExecuteAsync();

        return movies.Count;
    }
```

## Scenarios for DynamoDB using AWS SDKs

The following code examples show how to use Amazon DynamoDB with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Accelerate DynamoDB reads with DAX using an AWS SDK \(p. 449\)](#)
- [Get started using DynamoDB tables, items, and queries using an AWS SDK \(p. 454\)](#)
- [Query a DynamoDB table by using batches of PartiQL statements and an AWS SDK \(p. 522\)](#)
- [Query a DynamoDB table using PartiQL and an AWS SDK \(p. 561\)](#)

## Accelerate DynamoDB reads with DAX using an AWS SDK

The following code example shows how to:

- Create and write data to a table with both the DAX and SDK clients.
- Get, query, and scan the table with both the DAX and SDK clients and compare their performance.

For more information, see [Developing with the DynamoDB Accelerator Client](#).

### Python

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a table with either the DAX or Boto3 client.

```
import boto3

def create_dax_table(dyn_resource=None):
    """
    Creates a DynamoDB table.

    :param dyn_resource: Either a Boto3 or DAX resource.
    :return: The newly created table.
    """
    if dyn_resource is None:
        dyn_resource = boto3.resource('dynamodb')

    table_name = 'TryDaxTable'
    params = {
        'TableName': table_name,
        'KeySchema': [
            {'AttributeName': 'partition_key', 'KeyType': 'HASH'},
            {'AttributeName': 'sort_key', 'KeyType': 'RANGE'}
        ],
        'AttributeDefinitions': [
```

```
        {'AttributeName': 'partition_key', 'AttributeType': 'N'},
        {'AttributeName': 'sort_key', 'AttributeType': 'N'}
    ],
    'ProvisionedThroughput': {
        'ReadCapacityUnits': 10,
        'WriteCapacityUnits': 10
    }
}
table = dyn_resource.create_table(**params)
print(f"Creating {table_name}...")
table.wait_until_exists()
return table

if __name__ == '__main__':
    dax_table = create_dax_table()
    print(f"Created table.")
```

Write test data to the table.

```
import boto3

def write_data_to_dax_table(key_count, item_size, dyn_resource=None):
    """
    Writes test data to the demonstration table.

    :param key_count: The number of partition and sort keys to use to populate the
                      table. The total number of items is key_count * key_count.
    :param item_size: The size of non-key data for each test item.
    :param dyn_resource: Either a Boto3 or DAX resource.
    """
    if dyn_resource is None:
        dyn_resource = boto3.resource('dynamodb')

    table = dyn_resource.Table('TryDaxTable')

  - [PutItem](#)
  - [Query](#)
  - [Scan](#)

## Get started using DynamoDB tables, items, and queries using an AWS SDK

The following code examples show how to:

- Create a table that can hold movie data.
- Put, get, and update a single movie in the table.
- Write movie data to the table from a sample JSON file.
- Query for movies that were released in a given year.
- Scan for movies that were released in a range of years.
- Delete a movie from the table.
- Delete the table.

.NET

**AWS SDK for .NET**

**Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// This example application performs the following basic Amazon DynamoDB
// functions:
//
//      CreateTableAsync
//      PutItemAsync
//      UpdateItemAsync
//      BatchWriteItemAsync
//      GetItemAsync
//      DeleteItemAsync
//      Query
//      Scan
//      DeleteItemAsync
//
// The code in this example uses the AWS SDK for .NET version 3.7 and .NET 5.
// Before you run this example, download 'movies.json' from
// https://github.com/awsdocs/aws-doc-sdk-examples/tree/main/resources/
// sample_files,
// and put it in the same folder as the example.

Run an interactive scenario to create the table and perform actions on it.

```
// RunMovieScenario is an interactive example that shows you how to use the AWS SDK
for Go
// to create and use an Amazon DynamoDB table that stores data about movies.
//
// 1. Create a table that can hold movie data.
// 2. Put, get, and update a single movie in the table.
// 3. Write movie data to the table from a sample JSON file.
// 4. Query for movies that were released in a given year.
// 5. Scan for movies that were released in a range of years.
// 6. Delete a movie from the table.
// 7. Delete the table.
//
// This example creates a DynamoDB service client from the specified sdkConfig so
// that
// you can replace it with a mocked or stubbed config for unit testing.
//
// It uses a questioner from the `demotools` package to get input during the
// example.
// This package can be found in the ..\..\demotools folder of this repo.
//
// The specified movie sampler is used to get sample data from a URL that is loaded
// into the named table.

## Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a DynamoDB table.

```
// Create a table with a Sort key.
public static void createTable(DynamoDbClient ddb, String tableName) {
    DynamoDbWaiter dbWaiter = ddb.waiter();
```

```

ArrayList<AttributeDefinition> attributeDefinitions = new ArrayList<>();

// Define attributes.
attributeDefinitions.add(AttributeDefinition.builder()
    .attributeName("year")
    .attributeType("N")
    .build());

attributeDefinitions.add(AttributeDefinition.builder()
    .attributeName("title")
    .attributeType("S")
    .build());

ArrayList<KeySchemaElement> tableKey = new ArrayList<>();
KeySchemaElement key = KeySchemaElement.builder()
    .attributeName("year")
    .keyType(KeyType.HASH)
    .build();

KeySchemaElement key2 = KeySchemaElement.builder()
    .attributeName("title")
    .keyType(KeyType.RANGE)
    .build();

// Add KeySchemaElement objects to the list.
tableKey.add(key);
tableKey.add(key2);

CreateTableRequest request = CreateTableRequest.builder()
    .keySchema(tableKey)
    .provisionedThroughput(ProvisionedThroughput.builder()
        .readCapacityUnits(new Long(10))
        .writeCapacityUnits(new Long(10))
        .build())
    .attributeDefinitions(attributeDefinitions)
    .tableName(tableName)
    .build();

try {
    CreateTableResponse response = ddb.createTable(request);
    DescribeTableRequest tableRequest = DescribeTableRequest.builder()
        .tableName(tableName)
        .build();

    // Wait until the Amazon DynamoDB table is created.
    WaiterResponse<DescribeTableResponse> waiterResponse =
    dbWaiter.waitUntilTableExists(tableRequest);
    waiterResponse.matched().response().ifPresent(System.out::println);
    String newTable = response.tableDescription().tableName();
    System.out.println("The " +newTable + " was successfully created.");

} catch (DynamoDbException e) {
    System.err.println(e.getMessage());
    System.exit(1);
}
}
}

```

Create a helper function to download and extract the sample JSON file.

```

// Load data into the table.
public static void loadData(DynamoDbClient ddb, String tableName, String
fileName) throws IOException {
    DynamoDbEnhancedClient enhancedClient = DynamoDbEnhancedClient.builder()
        .dynamoDbClient(ddb)

```

```
.build();

DynamoDbTable<Movies> mappedTable = enhancedClient.table("Movies",
TableSchema.fromBean(Movies.class));
JsonParser parser = new JsonFactory().createParser(new File(fileName));
com.fasterxml.jackson.databind.JsonNode rootNode = new
ObjectMapper().readTree(parser);
Iterator<JsonNode> iter = rootNode.iterator();
ObjectNode currentNode;
int t = 0 ;
while (iter.hasNext()) {
    // Only add 200 Movies to the table.
    if (t == 200)
        break ;
    currentNode = (ObjectNode) iter.next();

    int year = currentNode.path("year").asInt();
    String title = currentNode.path("title").asText();
    String info = currentNode.path("info").toString();

    Movies movies = new Movies();
    movies.setYear(year);
    movies.setTitle(title);
    movies.setInfo(info);

    // Put the data into the Amazon DynamoDB Movie table.
    mappedTable.putItem(movies);
    t++;
}
}
```

Get an item from a table.

```
public static void getItem(DynamoDbClient ddb) {

    HashMap<String,AttributeValue> keyToGet = new HashMap<>();
    keyToGet.put("year", AttributeValue.builder()
        .n("1933")
        .build());

    keyToGet.put("title", AttributeValue.builder()
        .s("King Kong")
        .build());

    GetItemRequest request = GetItemRequest.builder()
        .key(keyToGet)
        .tableName("Movies")
        .build();

    try {
        Map<String,AttributeValue> returnedItem = ddb.getItem(request).item();

        if (returnedItem != null) {
            Set<String> keys = returnedItem.keySet();
            System.out.println("Amazon DynamoDB table attributes: \n");

            for (String key1 : keys) {
                System.out.format("%s: %s\n", key1,
                    returnedItem.get(key1).toString());
            }
        } else {
            System.out.format("No item found with the key %s!\n", "year");
        }
    }
```

```
        } catch (DynamoDbException e) {
            System.err.println(e.getMessage());
            System.exit(1);
        }
    }
```

Full example.

```
/***
 * Before running this Java V2 code example, set up your development environment,
 * including your credentials.
 *
 * For more information, see the following documentation topic:
 *
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html
 *
 * This Java example performs these tasks:
 *
 * 1. Creates the Amazon DynamoDB Movie table with partition and sort key.
 * 2. Puts data into the Amazon DynamoDB table from a JSON document using the Enhanced client.
 * 3. Gets data from the Movie table.
 * 4. Adds a new item.
 * 5. Updates an item.
 * 6. Uses a Scan to query items using the Enhanced client.
 * 7. Queries all items where the year is 2013 using the Enhanced Client.
 * 8. Deletes the table.
 */

## JavaScript

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a DynamoDB client.

```
// Create the DynamoDB service client module using ES6 syntax.  
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";  
import { DEFAULT_REGION } from "../../../../../libs/utils/util-aws-sdk.js";  
// Create an Amazon DynamoDB service client object.  
export const ddbClient = new DynamoDBClient({ region: DEFAULT_REGION });
```

Create a DynamoDB document client.

```
// Create a service client module using ES6 syntax.  
import { DynamoDBDocumentClient } from "@aws-sdk/lib-dynamodb";  
import { ddbClient } from "./ddbClient.js";  
  
const marshallOptions = {  
    // Whether to automatically convert empty strings, blobs, and sets to `null`.  
    convertEmptyValues: false, // false, by default.  
    // Whether to remove undefined values while marshalling.  
    removeUndefinedValues: true, // false, by default.  
    // Whether to convert typeof object to map attribute.  
    convertClassInstanceToMap: false, // false, by default.  
};  
  
const unmarshallOptions = {  
    // Whether to return numbers as a string instead of converting them to native  
    // JavaScript numbers.  
    wrapNumbers: false, // false, by default.  
};  
  
// Create the DynamoDB document client.  
const ddbDocClient = DynamoDBDocumentClient.from(ddbClient, {  
    marshallOptions,  
    unmarshallOptions,  
});  
  
export { ddbDocClient };
```

Run the scenario.

```
import fs from "fs";  
import { splitEvery } from "ramda";  
import {  
    PutCommand,  
    GetCommand,  
    UpdateCommand,

## Kotlin

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a DynamoDB table.

```
suspend fun createScenarioTable(tableNameVal: String, key: String) {

    val attDef = AttributeDefinition {
        attributeName = key
        attributeType = ScalarAttributeType.N
    }

    val attDef1 = AttributeDefinition {
        attributeName = "title"
        attributeType = ScalarAttributeType.S
    }

    val keySchemaVal = KeySchemaElement {
        attributeName = key
        keyType = KeyType.Hash
    }

    val keySchemaVal1 = KeySchemaElement {
        attributeName = "title"
        keyType = KeyType.Range
    }

    val provisionedVal = ProvisionedThroughput {
        readCapacityUnits = 10
        writeCapacityUnits = 10
    }

    val request = CreateTableRequest {
        attributeDefinitions = listOf(attDef, attDef1)
        keySchema = listOf(keySchemaVal, keySchemaVal1)
        provisionedThroughput = provisionedVal
        tableName = tableNameVal
    }

    DynamoDbClient { region = "us-east-1" }.use { ddb ->

        val response = ddb.createTable(request)
        ddb.waitUntilTableExists { // suspend call
            tableName = tableNameVal
        }
        println("The table was successfully created
${response.tableDescription?.tableArn}")
    }
}
```

Create a helper function to download and extract the sample JSON file.

```
// Load data into the table.
suspend fun loadData(tableName: String, fileName: String) {
```

```
val parser = JsonFactory().createParser(File(fileName))
val rootNode = ObjectMapper().readTree<JsonNode>(parser)
val iter: Iterator<JsonNode> = rootNode.iterator()
var currentNode: ObjectNode

var t = 0
while (iter.hasNext()) {

    if (t == 50)
        break

    currentNode = iter.next() as ObjectNode
    val year = currentNode.path("year").asInt()
    val title = currentNode.path("title").asText()
    val info = currentNode.path("info").toString()
    putMovie(tableName, year, title, info)
    t++
}
}

suspend fun putMovie(
    tableNameVal: String,
    year: Int,
    title: String,
    info: String
) {
    val itemValues = mutableMapOf<String, AttributeValue>()
    val strVal = year.toString()
    // Add all content to the table.
    itemValues["year"] = AttributeValue.N(strVal)
    itemValues["title"] = AttributeValue.S(title)
    itemValues["info"] = AttributeValue.S(info)

    val request = PutItemRequest {
        tableName = tableNameVal
        item = itemValues
    }

    DynamoDbClient { region = "us-east-1" }.use { ddb ->
        ddb.putItem(request)
        println("Added '$title' to the Movie table.")
    }
}
```

Get an item from a table.

```
suspend fun getMovie(tableNameVal: String, keyName: String, keyVal: String) {

    val keyToGet = mutableMapOf<String, AttributeValue>()
    keyToGet[keyName] = AttributeValue.N(keyVal)
    keyToGet["title"] = AttributeValue.S("King Kong")

    val request = GetItemRequest {
        key = keyToGet
        tableName = tableNameVal
    }

    DynamoDbClient { region = "us-east-1" }.use { ddb ->
        val returnedItem = ddb.getItem(request)
        val numbersMap = returnedItem.item
        numbersMap?.forEach { key1 ->
            println(key1.key)
            println(key1.value)
        }
    }
}
```

```
        }
    }
}
```

Full example.

```
suspend fun main(args: Array<String>) {

    val usage = """
        Usage:
            <fileName>

        Where:
            fileName - The path to the moviedata.json you can download from the
            Amazon DynamoDB Developer Guide.
        """

    if (args.size != 1) {
        println(usage)
        exitProcess(1)
    }

    // Get the moviedata.json from the Amazon DynamoDB Developer Guide.
    val tableName = "Movies"
    val fileName = args[0]
    val partitionAlias = "#a"

## Query a DynamoDB table by using batches of PartiQL statements and an AWS SDK

The following code examples show how to:

- Get a batch of items by running multiple SELECT statements.
- Add a batch of items by running multiple INSERT statements.
- Update a batch of items by running multiple UPDATE statements.
- Delete a batch of items by running multiple DELETE statements.

.NET

## AWS SDK for .NET

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Before you run this example, download 'movies.json' from

## JavaScript

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create the DynamoDB service client module using ES6 syntax.
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";
// Set the AWS Region.
export const REGION = "eu-west-1"; // For example, "us-east-1".
// Create an Amazon DynamoDB service client object.
export const ddbClient = new DynamoDBClient({ region: REGION });
```

Create the document client.

```
// Create a service client module using ES6 syntax.
import { DynamoDBDocumentClient } from "@aws-sdk/lib-dynamodb";
import { ddbClient } from "./ddbClient.js";

const marshallOptions = {
```

```
// Whether to automatically convert empty strings, blobs, and sets to `null`.
convertEmptyValues: false, // false, by default.
// Whether to remove undefined values while marshalling.
removeUndefinedValues: false, // false, by default.
// Whether to convert typeof object to map attribute.
convertClassInstanceToMap: false, // false, by default.
};

const unmarshallOptions = {
    // Whether to return numbers as a string instead of converting them to native
    // JavaScript numbers.
    wrapNumbers: false, // false, by default.
};

const translateConfig = { marshallOptions, unmarshallOptions };

// Create the DynamoDB document client.
const ddbDocClient = DynamoDBDocumentClient.from(ddbClient, translateConfig);

export { ddbDocClient };
```

Query items by batch.

```
/*
import fs from "fs";
// A practical functional library used to split the data into segments.
import * as R from "ramda";
import { ddbClient } from "../libs/ddbClient.js";
import { ddbDocClient } from "../libs/ddbDocClient.js";
import { BatchWriteCommand } from "@aws-sdk/lib-dynamodb";
import {
    CreateTableCommand,
    BatchExecuteStatementCommand,
} from "@aws-sdk/client-dynamodb";

## Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a class that can run batches of PartiQL statements.

```
from datetime import datetime
from decimal import Decimal
import logging
from pprint import pprint

import boto3
from botocore.exceptions import ClientError

from scaffold import Scaffold

logger = logging.getLogger(__name__)

class PartiQLBatchWrapper:
    """
    Encapsulates a DynamoDB resource to run PartiQL statements.
    """
    def __init__(self, dyn_resource):
        """
        :param dyn_resource: A Boto3 DynamoDB resource.
        """
        self.dyn_resource = dyn_resource

    def run_partiql(self, statements, param_list):
        """
        Runs a PartiQL statement. A Boto3 resource is used even though
        `execute_statement` is called on the underlying `client` object because the
        resource transforms input and output from plain old Python objects (POPOs)
        to
        the DynamoDB format. If you create the client directly, you must do these
        transforms yourself.

        :param statements: The batch of PartiQL statements.
        :param param_list: The batch of PartiQL parameters that are associated with
                           each statement. This list must be in the same order as
                           the
                           statements.
        :return: The responses returned from running the statements, if any.
        """
        try:
            output = self.dyn_resource.meta.client.batch_execute_statement(
                Statements=[{
                    'Statement': statement, 'Parameters': params
                } for statement, params in zip(statements, param_list)])
        except ClientError as err:
            if err.response['Error']['Code'] == 'ResourceNotFoundException':
                logger.error(
                    "Couldn't execute batch of PartiQL statements because the table"
                    "does not exist.")

## Query a DynamoDB table using PartiQL and an AWS SDK

The following code examples show how to:

- Get an item by running a SELECT statement.
- Add an item by running an INSERT statement.
- Update an item by running an UPDATE statement.
- Delete an item by running a DELETE statement.

.NET

### AWS SDK for .NET

### SDK for Go V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a struct that is a receiver for methods that can run PartiQL statements.

```
// PartiQLRunner encapsulates the Amazon DynamoDB service actions used in the
// PartiQL examples. It contains a DynamoDB service client that is used to act on
// the
// specified table.
type PartiQLRunner struct {
    DynamoDbClient *dynamodb.Client
    TableName       string
}

// AddMovie runs a PartiQL INSERT statement to add a movie to the DynamoDB table.
func (runner PartiQLRunner) AddMovie(movie Movie) error {
    params, err := attributevalue.MarshalList([]interface{}{movie.Title, movie.Year,
    movie.Info})
    if err != nil {
        panic(err)
    }
    _, err = runner.DynamoDbClient.ExecuteStatement(context.TODO(),
    &dynamodb.ExecuteStatementInput{
        Statement: aws.String(
            fmt.Sprintf("INSERT INTO \"%v\" VALUE {'title': ?, 'year': ?, 'info': ?}",
            runner.TableName)),
        Parameters: params,
    })
    if err != nil {
        log.Printf("Couldn't insert an item with PartiQL. Here's why: %v\n", err)
    }
    return err
}

// GetMovie runs a PartiQL SELECT statement to get a movie from the DynamoDB table
// by
// title and year.
func (runner PartiQLRunner) GetMovie(title string, year int) (Movie, error) {
    var movie Movie
    params, err := attributevalue.MarshalList([]interface{}{title, year})
    if err != nil {
        panic(err)
    }
    response, err := runner.DynamoDbClient.ExecuteStatement(context.TODO(),
    &dynamodb.ExecuteStatementInput{
        Statement: aws.String(
            fmt.Sprintf("SELECT * FROM \"%v\" WHERE title=? AND year=?",
            runner.TableName)),
        Parameters: params,
    })
    if err != nil {
        log.Printf("Couldn't get a movie with PartiQL. Here's why: %v\n", err)
    }
    err = attributevalue.Unmarshal(response.Items, &movie)
    if err != nil {
        log.Printf("Error unmarshaling movie: %v\n", err)
    }
    return movie, nil
}
```

```
        runner.TableName)),
    Parameters: params,

    if err != nil {
        log.Printf("Couldn't unmarshal response. Here's why: %v\n", err)
    }
}
return movie, err
}

// UpdateMovie runs a PartiQL UPDATE statement to update the rating of a movie that
// already exists in the DynamoDB table.
func (runner PartiQLRunner) UpdateMovie(movie Movie, rating float64) error {
    params, err := attributevalue.MarshalList([]interface{}{rating, movie.Title,
    movie.Year})
    if err != nil {
        panic(err)
    }
    _, err = runner.DynamoDbClient.ExecuteStatement(context.TODO(),
    &dynamodb.ExecuteStatementInput{
        Statement: aws.String(
            fmt.Sprintf("UPDATE \"%v\" SET info.rating=? WHERE title=? AND year=?",
            runner.TableName)),
        Parameters: params,
    })
    if err != nil {
        log.Printf("Couldn't update movie %v. Here's why: %v\n", movie.Title, err)
    }
    return err
}

// DeleteMovie runs a PartiQL DELETE statement to remove a movie from the DynamoDB
// table.
func (runner PartiQLRunner) DeleteMovie(movie Movie) error {
    params, err := attributevalue.MarshalList([]interface{}{movie.Title, movie.Year})
    if err != nil {
        panic(err)
    }
    _, err = runner.DynamoDbClient.ExecuteStatement(context.TODO(),
    &dynamodb.ExecuteStatementInput{
        Statement: aws.String(
            fmt.Sprintf("DELETE FROM \"%v\" WHERE title=? AND year=?",
            runner.TableName)),
        Parameters: params,
    })
    if err != nil {
        log.Printf("Couldn't delete %v from the table. Here's why: %v\n", movie.Title,
        err)
    }
    return err
}
```

Run a scenario that creates a table and runs PartiQL queries.

```
// RunPartiQLSingleScenario shows you how to use the AWS SDK for Go
// to use PartiQL to query a table that stores data about movies.
//
// * Use PartiQL statements to add, get, update, and delete data for individual
//   movies.
//
// This example creates an Amazon DynamoDB service client from the specified
// sdkConfig so that
// you can replace it with a mocked or stubbed config for unit testing.
//
// This example creates and deletes a DynamoDB table to use during the scenario.
func RunPartiQLSingleScenario(sdkConfig aws.Config, tableName string) {

    $this->dynamoDbClient->executeStatement([
        'Statement' => $statement,
        'Parameters' => $parameters,
    ]);
}
```

- For API details, see [ExecuteStatement](#) in *AWS SDK for PHP API Reference*.

## Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a class that can run PartiQL statements.

```
from datetime import datetime
from decimal import Decimal
import logging
from pprint import pprint

import boto3
from botocore.exceptions import ClientError

from scaffold import Scaffold

logger = logging.getLogger(__name__)

class PartiQLWrapper:
    """
    Encapsulates a DynamoDB resource to run PartiQL statements.
    """
    def __init__(self, dyn_resource):
        """
        :param dyn_resource: A Boto3 DynamoDB resource.
        """
        self.dyn_resource = dyn_resource

    def run_partiql(self, statement, params):
        """
        Runs a PartiQL statement. A Boto3 resource is used even though
        `execute_statement` is called on the underlying `client` object because the
        resource transforms input and output from plain old Python objects (POPOs)
        to
        the DynamoDB format. If you create the client directly, you must do these
        transforms yourself.

        :param statement: The PartiQL statement.
        :param params: The list of PartiQL parameters. These are applied to the
                      statement in the order they are listed.
        :return: The items returned from the statement, if any.
        """

```

```
"""
try:
    output = self.dyn_resource.meta.client.execute_statement(
        Statement=statement, Parameters=params)
except ClientError as err:
    if err.response['Error']['Code'] == 'ResourceNotFoundException':
        logger.error(
            "Couldn't execute PartiQL '%s' because the table does not
exist.", statement)
    else:
        logger.error(
            "Couldn't execute PartiQL '%s'. Here's why: %s: %s", statement,
            err.response['Error']['Code'], err.response['Error']
        ['Message']))
        raise
else:
    return output
```

Run a scenario that creates a table and runs PartiQL queries.

```
def run_scenario(scaffold, wrapper, table_name):
    logging.basicConfig(level=logging.INFO, format='%(levelname)s: %(message)s')

    print('*'*88)
    print("Welcome to the Amazon DynamoDB PartiQL single statement demo.")
    print('*'*88)

    print(f"Creating table '{table_name}' for the demo...")
    scaffold.create_table(table_name)
    print('*'*88)

    title = "24 Hour PartiQL People"
    year = datetime.now().year
    plot = "A group of data developers discover a new query language they can't
stop using."
    rating = Decimal('9.9')

    print(f"Inserting movie '{title}' released in {year}.")
    wrapper.run_partiql(
        f"INSERT INTO \"{table_name}\" VALUE {{'title': ?, 'year': ?, 'info': ?}}",
        [title, year, {'plot': plot, 'rating': rating}])
    print("Success!")
    print('*'*88)

    print(f"Getting data for movie '{title}' released in {year}.")
    output = wrapper.run_partiql(
        f"SELECT * FROM \"{table_name}\" WHERE title=? AND year=?", [title, year])
    for item in output['Items']:
        print(f"\n{item['title']}, {item['year']}")
        pprint(output['Items'])
    print('*'*88)

    rating = Decimal('2.4')
    print(f"Updating movie '{title}' with a rating of {float(rating)}.")
    wrapper.run_partiql(
        f"UPDATE \"{table_name}\" SET info.rating=? WHERE title=? AND year=?",
        [rating, title, year])
    print("Success!")
    print('*'*88)

    print(f"Getting data again to verify our update.")
    output = wrapper.run_partiql(
        f"SELECT * FROM \"{table_name}\" WHERE title=? AND year=?", [title, year])
```

```
for item in output['Items']:
    print(f"\n{item['title']}, {item['year']}")  
    pprint(output['Items'])  
print('*'*88)  
  
print(f"Deleting movie '{title}' released in {year}.")  
wrapper.run_partiql(  
    f"DELETE FROM \'{table_name}\' WHERE title=? AND year=?", [title, year])
print("Success!")
print('*'*88)  
  
print(f"Deleting table '{table_name}'...")
scaffold.delete_table()
print('*'*88)  
  
print("\nThanks for watching!")
print('*'*88)  
  
if __name__ == '__main__':
    try:
        dyn_res = boto3.resource('dynamodb')
        scaffold = Scaffold(dyn_res)
        movies = PartiQLWrapper(dyn_res)
        run_scenario(scaffold, movies, 'doc-example-table-partiql-movies')
    except Exception as e:
        print(f"Something went wrong with the demo! Here's what: {e}")
```

- For API details, see [ExecuteStatement](#) in *AWS SDK for Python (Boto3) API Reference*.

## Cross-service examples for DynamoDB using AWS SDKs

The following code examples show how to use Amazon DynamoDB with AWS SDKs. Each example contains a sample application that works across multiple AWS services.

### Examples

- [Build an application to submit data to a DynamoDB table \(p. 594\)](#)
- [Create an API Gateway REST API to track COVID-19 data \(p. 595\)](#)
- [Create a messenger application with Step Functions \(p. 596\)](#)
- [Create a web application to track DynamoDB data \(p. 597\)](#)
- [Create a websocket chat application with API Gateway \(p. 598\)](#)
- [Detect PPE in images with Amazon Rekognition using an AWS SDK \(p. 599\)](#)
- [Invoke a Lambda function from a browser \(p. 599\)](#)
- [Save EXIF and other image information using an AWS SDK \(p. 600\)](#)
- [Use API Gateway to invoke a Lambda function \(p. 601\)](#)
- [Use Step Functions to invoke Lambda functions \(p. 601\)](#)
- [Use scheduled events to invoke a Lambda function \(p. 602\)](#)

### Build an application to submit data to a DynamoDB table

The following code examples show how to build an application that submits data to an Amazon DynamoDB table and notifies you when a user updates the table.

## Java

### SDK for Java 2.x

Shows how to create a dynamic web application that submits data using the Amazon DynamoDB Java API and sends a text message using the Amazon Simple Notification Service Java API.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- DynamoDB
- Amazon SNS

## JavaScript

### SDK for JavaScript V3

This example shows how to build an app that enables users to submit data to an Amazon DynamoDB table, and send a text message to the administrator using Amazon Simple Notification Service (Amazon SNS).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

This example is also available in the [AWS SDK for JavaScript v3 developer guide](#).

#### Services used in this example

- DynamoDB
- Amazon SNS

## Kotlin

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

Shows how to create a native Android application that submits data using the Amazon DynamoDB Kotlin API and sends a text message using the Amazon SNS Kotlin API.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- DynamoDB
- Amazon SNS

## Create an API Gateway REST API to track COVID-19 data

The following code example shows how to create a REST API that simulates a system to track daily cases of COVID-19 in the United States, using fictional data.

## Python

### SDK for Python (Boto3)

Shows how to use AWS Chalice with the AWS SDK for Python (Boto3) to create a serverless REST API that uses Amazon API Gateway, AWS Lambda, and Amazon DynamoDB. The REST API simulates a system that tracks daily cases of COVID-19 in the United States, using fictional data. Learn how to:

- Use AWS Chalice to define routes in Lambda functions that are called to handle REST requests that come through API Gateway.
- Use Lambda functions to retrieve and store data in a DynamoDB table to serve REST requests.
- Define table structure and security role resources in an AWS CloudFormation template.
- Use AWS Chalice and CloudFormation to package and deploy all necessary resources.
- Use CloudFormation to clean up all created resources.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- API Gateway
- AWS CloudFormation
- DynamoDB
- Lambda

## Create a messenger application with Step Functions

The following code example shows how to create an AWS Step Functions messenger application that retrieves message records from a database table.

## Python

### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) with AWS Step Functions to create a messenger application that retrieves message records from an Amazon DynamoDB table and sends them with Amazon Simple Queue Service (Amazon SQS). The state machine integrates with an AWS Lambda function to scan the database for unsent messages.

- Create a state machine that retrieves and updates message records from an Amazon DynamoDB table.
- Update the state machine definition to also send messages to Amazon Simple Queue Service (Amazon SQS).
- Start and stop state machine runs.
- Connect to Lambda, DynamoDB, and Amazon SQS from a state machine by using service integrations.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- DynamoDB
- Lambda
- Amazon SQS
- Step Functions

## Create a web application to track DynamoDB data

The following code examples show how to create a web application that tracks work items in an Amazon DynamoDB table and uses Amazon Simple Email Service (Amazon SES) to send reports.

.NET

### AWS SDK for .NET

Shows how to use the Amazon DynamoDB .NET API to create a dynamic web application that tracks DynamoDB work data.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- DynamoDB
- Amazon SES

Java

### SDK for Java 2.x

Shows how to use the Amazon DynamoDB API to create a dynamic web application that tracks DynamoDB work data.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- DynamoDB
- Amazon SES

JavaScript

### SDK for JavaScript V3

Shows how to use the Amazon DynamoDB API to create a dynamic web application that tracks DynamoDB work data.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- DynamoDB
- Amazon SES

Kotlin

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

Shows how to use the Amazon DynamoDB API to create a dynamic web application that tracks DynamoDB work data.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- DynamoDB
- Amazon SES

Python

#### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) to create a REST service that tracks work items in Amazon DynamoDB and emails reports by using Amazon Simple Email Service (Amazon SES). This example uses the Flask web framework to handle HTTP routing and integrates with a React webpage to present a fully functional web application.

- Build a Flask REST service that integrates with AWS services.
- Read, write, and update work items that are stored in a DynamoDB table.
- Use Amazon SES to send email reports of work items.

For complete source code and instructions on how to set up and run, see the full example in the [AWS Code Examples Repository](#) on GitHub.

#### Services used in this example

- DynamoDB
- Amazon SES

## Create a websocket chat application with API Gateway

The following code example shows how to create a chat application that is served by a websocket API built on Amazon API Gateway.

Python

#### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) with Amazon API Gateway V2 to create a websocket API that integrates with AWS Lambda and Amazon DynamoDB.

- Create a websocket API served by API Gateway.
- Define a Lambda handler that stores connections in DynamoDB and posts messages to other chat participants.
- Connect to the websocket chat application and send messages with the Websockets package.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- API Gateway
- DynamoDB
- Lambda

## Detect PPE in images with Amazon Rekognition using an AWS SDK

The following code examples show how to build an app that uses Amazon Rekognition to detect Personal Protective Equipment (PPE) in images.

Java

### SDK for Java 2.x

Shows how to create an AWS Lambda function that detects images with Personal Protective Equipment.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- DynamoDB
- Amazon Rekognition
- Amazon S3
- Amazon SES

JavaScript

### SDK for JavaScript V3

Shows how to use Amazon Rekognition with the AWS SDK for JavaScript to create an application to detect personal protective equipment (PPE) in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app saves the results to an Amazon DynamoDB table, and sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

Learn how to:

- Create an unauthenticated user using Amazon Cognito.
- Analyze images for PPE using Amazon Rekognition.
- Verify an email address for Amazon SES.
- Update a DynamoDB table with results.
- Send an email notification using Amazon SES.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- DynamoDB
- Amazon Rekognition
- Amazon S3
- Amazon SES

## Invoke a Lambda function from a browser

The following code example shows how to invoke an AWS Lambda function from a browser.

## JavaScript

### SDK for JavaScript V2

You can create a browser-based application that uses an AWS Lambda function to update an Amazon DynamoDB table with user selections.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- DynamoDB
- Lambda

### SDK for JavaScript V3

You can create a browser-based application that uses an AWS Lambda function to update an Amazon DynamoDB table with user selections. This app uses AWS SDK for JavaScript v3.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- DynamoDB
- Lambda

## Save EXIF and other image information using an AWS SDK

The following code example shows how to:

- Get EXIF information from a a JPG, JPEG, or PNG file.
- Upload the image file to an Amazon Simple Storage Service (Amazon S3) bucket.
- Use Amazon Rekognition (Amazon Rekognition) to identify the three top attributes (labels in Amazon Rekognition) in the file.
- Add the EXIF and label information to a Amazon DynamoDB (DynamoDB) table in the Region.

## Rust

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

Get EXIF information from a JPG, JPEG, or PNG file, upload the image file to an Amazon Simple Storage Service bucket, use Amazon Rekognition to identify the three top attributes (*labels* in Amazon Rekognition) in the file, and add the EXIF and label information to a Amazon DynamoDB table in the Region.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- DynamoDB
- Amazon Rekognition

- Amazon S3

## Use API Gateway to invoke a Lambda function

The following code examples show how to create an AWS Lambda function invoked by Amazon API Gateway.

Java

### SDK for Java 2.x

Shows how to create an AWS Lambda function by using the Lambda Java runtime API. This example invokes different AWS services to perform a specific use case. This example demonstrates how to create a Lambda function invoked by Amazon API Gateway that scans an Amazon DynamoDB table for work anniversaries and uses Amazon Simple Notification Service (Amazon SNS) to send a text message to your employees that congratulates them at their one year anniversary date.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- API Gateway
- DynamoDB
- Lambda
- Amazon SNS

JavaScript

### SDK for JavaScript V3

Shows how to create an AWS Lambda function by using the Lambda JavaScript runtime API. This example invokes different AWS services to perform a specific use case. This example demonstrates how to create a Lambda function invoked by Amazon API Gateway that scans an Amazon DynamoDB table for work anniversaries and uses Amazon Simple Notification Service (Amazon SNS) to send a text message to your employees that congratulates them at their one year anniversary date.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

This example is also available in the [AWS SDK for JavaScript v3 developer guide](#).

### Services used in this example

- API Gateway
- DynamoDB
- Lambda
- Amazon SNS

## Use Step Functions to invoke Lambda functions

The following code examples show how to create an AWS Step Functions state machine that invokes AWS Lambda functions in sequence.

Java

### SDK for Java 2.x

Shows how to create an AWS serverless workflow by using AWS Step Functions and the AWS SDK for Java 2.x. Each workflow step is implemented using an AWS Lambda function.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- DynamoDB
- Lambda
- Amazon SES
- Step Functions

JavaScript

### SDK for JavaScript V3

Shows how to create an AWS serverless workflow by using AWS Step Functions and the AWS SDK for JavaScript. Each workflow step is implemented using an AWS Lambda function.

Lambda is a compute service that enables you to run code without provisioning or managing servers. Step Functions is a serverless orchestration service that lets you combine Lambda functions and other AWS services to build business-critical applications.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

This example is also available in the [AWS SDK for JavaScript v3 developer guide](#).

#### Services used in this example

- DynamoDB
- Lambda
- Amazon SES
- Step Functions

## Use scheduled events to invoke a Lambda function

The following code examples show how to create an AWS Lambda function invoked by an Amazon EventBridge scheduled event.

Java

### SDK for Java 2.x

Shows how to create an Amazon EventBridge scheduled event that invokes an AWS Lambda function. Configure EventBridge to use a cron expression to schedule when the Lambda function is invoked. In this example, you create a Lambda function by using the Lambda Java runtime API. This example invokes different AWS services to perform a specific use case. This example demonstrates how to create an app that sends a mobile text message to your employees that congratulates them at the one year anniversary date.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- DynamoDB
- EventBridge
- Lambda
- Amazon SNS

JavaScript

#### SDK for JavaScript V3

Shows how to create an Amazon EventBridge scheduled event that invokes an AWS Lambda function. Configure EventBridge to use a cron expression to schedule when the Lambda function is invoked. In this example, you create a Lambda function by using the Lambda JavaScript runtime API. This example invokes different AWS services to perform a specific use case. This example demonstrates how to create an app that sends a mobile text message to your employees that congratulates them at the one year anniversary date.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

This example is also available in the [AWS SDK for JavaScript v3 developer guide](#).

### Services used in this example

- DynamoDB
- EventBridge
- Lambda
- Amazon SNS

## Code examples for Amazon EBS using AWS SDKs

The following code examples show how to use Amazon Elastic Block Store with an AWS software development kit (SDK).

### Code examples

- [Actions for Amazon EBS using AWS SDKs \(p. 603\)](#)
  - [Create a Amazon EBS snapshot using an AWS SDK \(p. 604\)](#)
  - [Seal and complete the Amazon EBS snapshot using an AWS SDK \(p. 604\)](#)
  - [Write a block of data to an Amazon EBS snapshot using an AWS SDK \(p. 605\)](#)

## Actions for Amazon EBS using AWS SDKs

The following code examples show how to use Amazon Elastic Block Store with AWS SDKs. Each example calls an individual service function.

### Examples

- [Create a Amazon EBS snapshot using an AWS SDK \(p. 604\)](#)

- [Seal and complete the Amazon EBS snapshot using an AWS SDK \(p. 604\)](#)
- [Write a block of data to an Amazon EBS snapshot using an AWS SDK \(p. 605\)](#)

## Create a Amazon EBS snapshot using an AWS SDK

The following code example shows how to create an Amazon EBS snapshot.

Rust

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn start(client: &Client, description: &str) -> Result<String, Error> {
    let snapshot = client
        .start_snapshot()
        .description(description)
        .encrypted(false)
        .volume_size(1)
        .send()
        .await?;

    Ok(snapshot.snapshot_id.unwrap())
}
```

- For API details, see [StartSnapshot](#) in *AWS SDK for Rust API reference*.

## Seal and complete the Amazon EBS snapshot using an AWS SDK

The following code example shows how to seal and complete an Amazon EBS snapshot.

Rust

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn finish(client: &Client, id: &str) -> Result<(), Error> {
    client
        .complete_snapshot()
        .changed_blocks_count(2)
        .snapshot_id(id)
        .send()
        .await?;
```

```
    println!("Snapshot ID {}", id);
    println!("The state is 'completed' when all of the modified blocks have been
transferred to Amazon S3.");
    println!("Use the get-snapshot-state code example to get the state of the
snapshot.");
}

Ok(())
}
```

- For API details, see [CompleteSnapshot](#) in *AWS SDK for Rust API reference*.

## Write a block of data to an Amazon EBS snapshot using an AWS SDK

The following code example shows how to write a block of data to an Amazon EBS snapshot.

Rust

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
async fn add_block(
    client: &Client,
    id: &str,
    idx: usize,
    block: Vec<u8>,
    checksum: &str,
) -> Result<(), Error> {
    client
        .put_snapshot_block()
        .snapshot_id(id)
        .block_index(idx as i32)
        .block_data(ByteStream::from(block))
        .checksum(checksum)
        .checksum_algorithm(ChecksumAlgorithm::ChecksumAlgorithmSha256)
        .data_length(EBS_BLOCK_SIZE as i32)
        .send()
        .await?;

    Ok(())
}
```

- For API details, see [PutSnapshotBlock](#) in *AWS SDK for Rust API reference*.

## Code examples for Amazon EC2 using AWS SDKs

The following code examples show how to use Amazon Elastic Compute Cloud with an AWS software development kit (SDK).

## Get started

### Hello Amazon EC2

The following code examples show how to get started using Amazon Elastic Compute Cloud (Amazon EC2).

Java

#### SDK for Java 2.x

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void describeEC2SecurityGroups(Ec2Client ec2, String groupId) {
    try {
        DescribeSecurityGroupsRequest request =
DescribeSecurityGroupsRequest.builder()
        .groupIds(groupId)
        .build();

        DescribeSecurityGroupsResponse response =
ec2.describeSecurityGroups(request);
        for(SecurityGroup group : response.securityGroups()) {
            System.out.printf(
                "Found Security Group with id %s, " +
                "vpc id %s " +
                "and description %s",
                group.groupId(),
                group.vpcId(),
                group.description());
        }
    } catch (Ec2Exception e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [DescribeSecurityGroups](#) in *AWS SDK for Java 2.x API Reference*.

Python

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
import boto3

def hello_ec2(ec2_resource):
    """
    Use the AWS SDK for Python (Boto3) to create an Amazon Elastic Compute Cloud
    (Amazon EC2) resource and list the security groups in your account.
    This example uses the default settings specified in your shared credentials
    and config files.

```

```
:param ec2_resource: A Boto3 EC2 ServiceResource object. This object is a high-
level
                           resource that wraps the low-level EC2 service API.
"""
print("Hello, Amazon EC2! Let's list up to 10 of your security groups:")
for sg in ec2_resource.security_groups.limit(10):
    print(f"\t{sg.id}: {sg.group_name}")

if __name__ == '__main__':
    hello_ec2(boto3.resource('ec2'))
```

- For API details, see [DescribeSecurityGroups](#) in *AWS SDK for Python (Boto3) API Reference*.

## Code examples

- [Actions for Amazon EC2 using AWS SDKs \(p. 608\)](#)

## Actions for Amazon EC2 using AWS SDKs

The following code examples show how to use Amazon Elastic Compute Cloud with AWS SDKs. Each example calls an individual service function.

### Examples

- [Allocate an Elastic IP address for Amazon EC2 using an AWS SDK \(p. 608\)](#)
- [Associate an Elastic IP address with an Amazon EC2 instance using an AWS SDK \(p. 610\)](#)
- [Create an Amazon EC2 VPC using an AWS SDK \(p. 612\)](#)
- [Create an Amazon EC2 security group using an AWS SDK \(p. 613\)](#)
- [Create a security key pair for Amazon EC2 using an AWS SDK \(p. 616\)](#)
- [Create and run an Amazon EC2 instance using an AWS SDK \(p. 619\)](#)
- [Delete an Amazon EC2 VPC using an AWS SDK \(p. 622\)](#)
- [Delete an Amazon EC2 security group using an AWS SDK \(p. 623\)](#)
- [Delete an Amazon EC2 security key pair using an AWS SDK \(p. 625\)](#)
- [Delete the Amazon EBS snapshot using an AWS SDK \(p. 628\)](#)
- [Describe the Availability Zones for your account using an AWS SDK \(p. 629\)](#)
- [Describes the Regions for your account using an AWS SDK \(p. 629\)](#)
- [Describes the status of Amazon EC2 instances using an AWS SDK \(p. 630\)](#)
- [Describe Amazon EC2 instances using an AWS SDK \(p. 631\)](#)
- [Describe one or more Amazon EBS snapshots using an AWS SDK \(p. 636\)](#)
- [Disassociate an Elastic IP address from an Amazon EC2 instance using an AWS SDK \(p. 637\)](#)
- [Enables monitoring for a running Amazon EC2 instance using an AWS SDK \(p. 638\)](#)
- [Get data about Amazon Machine Images using an AWS SDK \(p. 640\)](#)
- [Get data about an Amazon EC2 security group using an AWS SDK \(p. 641\)](#)
- [Get data about Amazon EC2 instance types using an AWS SDK \(p. 642\)](#)
- [Get details about Elastic IP addresses using an AWS SDK \(p. 644\)](#)
- [List Amazon EC2 security key pairs using an AWS SDK \(p. 645\)](#)
- [Reboot an Amazon EC2 instance using an AWS SDK \(p. 646\)](#)
- [Release an Elastic IP address using an AWS SDK \(p. 648\)](#)
- [Set inbound rules for an Amazon EC2 security group using an AWS SDK \(p. 650\)](#)
- [Start an Amazon EC2 instance using an AWS SDK \(p. 651\)](#)
- [Stop an Amazon EC2 instance using an AWS SDK \(p. 655\)](#)

## Scenarios for Amazon EC2 using AWS SDKs

The following code examples show how to use Amazon Elastic Compute Cloud with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Get started with Amazon EC2 instances using an AWS SDK \(p. 660\)](#)

## Get started with Amazon EC2 instances using an AWS SDK

The following code examples show how to:

- Create a key pair that is used to secure SSH communication between your computer and an EC2 instance.
- Create a security group that acts as a virtual firewall for your EC2 instances to control incoming and outgoing traffic.
- Find an Amazon Machine Image (AMI) and a compatible instance type.
- Create an instance that is created from the instance type and AMI you select, and is configured to use the security group and key pair created in this example.
- Stop and restart the instance.
- Create an Elastic IP address and associate it as a consistent IP address for your instance.
- Connect to your instance with SSH, using both its public IP address and your Elastic IP address.
- Clean up all of the resources created by this example.

Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/**  
 * Before running this Java (v2) code example, set up your development environment,  
 * including your credentials.  
 */
```

```
* For more information, see the following documentation topic:  
*  
* https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html  
*  
* This Java example performs the following tasks:  
*  
* 1. Creates an RSA key pair and saves the private key data as a .pem file.  
* 2. Lists key pairs.  
* 3. Creates a security group for the default VPC.  
* 4. Displays security group information.  
* 5. Gets a list of Amazon Linux 2 AMIs and selects one.  
* 6. Gets more information about the image.  
* 7. Gets a list of instance types that are compatible with the selected AMI's  
architecture.  
* 8. Creates an instance with the key pair, security group, AMI, and an instance  
type.  
* 9. Displays information about the instance.  
* 10. Stops the instance and waits for it to stop.  
* 11. Starts the instance and waits for it to start.  
* 12. Allocates an Elastic IP address and associates it with the instance.  
* 13. Displays SSH connection info for the instance.  
* 14. Disassociates and deletes the Elastic IP address.  
* 15. Terminates the instance and waits for it to terminate.  
* 16. Deletes the security group.  
* 17. Deletes the key pair.  
*/

## Cross-service examples for Amazon EC2 using AWS SDKs

The following code examples show how to use Amazon Elastic Compute Cloud with AWS SDKs. Each example contains a sample application that works across multiple AWS services.

### Examples

- [Create a long-lived Amazon EMR cluster and run several steps using an AWS SDK \(p. 683\)](#)
- [Create a short-lived Amazon EMR cluster and run a step using an AWS SDK \(p. 684\)](#)

## Create a long-lived Amazon EMR cluster and run several steps using an AWS SDK

The following code example shows how to create a long-lived Amazon EMR cluster and run several steps.

### Python

#### SDK for Python (Boto3)

Create a long-lived Amazon EMR cluster that uses Apache Spark to query historical Amazon review data from the [Amazon Customer Reviews Dataset](#). Run a job that gets data for top-rated products in specific categories that contain keywords in their product titles. Job results are written to an Amazon Simple Storage Service (Amazon S3) bucket.

- Create an Amazon S3 bucket and upload a job script.
- Create AWS Identity and Access Management (IAM) roles.
- Create Amazon Elastic Compute Cloud (Amazon EC2) security groups.
- Create a long-lived cluster and run several job steps.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon EC2
- Amazon EMR
- IAM

- Amazon S3

## Create a short-lived Amazon EMR cluster and run a step using an AWS SDK

The following code example shows how to create a short-lived Amazon EMR cluster that runs a step and automatically terminates after the step completes.

Python

### SDK for Python (Boto3)

Create a short-lived Amazon EMR cluster that estimates the value of pi using Apache Spark to parallelize a large number of calculations. The job writes output to Amazon EMR logs and to an Amazon Simple Storage Service (Amazon S3) bucket. The cluster terminates itself after completing the job.

- Create an Amazon S3 bucket and upload a job script.
- Create AWS Identity and Access Management (IAM) roles.
- Create Amazon Elastic Compute Cloud (Amazon EC2) security groups.
- Create a short-lived cluster and run a single job step.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon EC2
- Amazon EMR
- IAM
- Amazon S3

## Code examples for Amazon EC2 Auto Scaling using AWS SDKs

The following code examples show how to use Amazon EC2 Auto Scaling with an AWS software development kit (SDK).

### Code examples

- [Actions for Amazon EC2 Auto Scaling using AWS SDKs \(p. 685\)](#)
  - [Create an Auto Scaling group using an AWS SDK \(p. 685\)](#)
  - [Delete an Auto Scaling group using an AWS SDK \(p. 689\)](#)
  - [Disable CloudWatch metrics collection for an Auto Scaling group using an AWS SDK \(p. 692\)](#)
  - [Enable CloudWatch metrics collection for an Auto Scaling group using an AWS SDK \(p. 694\)](#)
  - [Get information about Auto Scaling groups using an AWS SDK \(p. 696\)](#)
  - [Get information about Auto Scaling instances using an AWS SDK \(p. 700\)](#)
  - [Get information about Auto Scaling activities using an AWS SDK \(p. 702\)](#)
  - [Set the desired capacity of an Auto Scaling group using an AWS SDK \(p. 705\)](#)
  - [Terminate an instance in an Auto Scaling group using an AWS SDK \(p. 707\)](#)

- Update an Auto Scaling group using an AWS SDK (p. 710)
- Scenarios for Amazon EC2 Auto Scaling using AWS SDKs (p. 713)
  - Manage Auto Scaling groups and instances using an AWS SDK (p. 713)

## Actions for Amazon EC2 Auto Scaling using AWS SDKs

The following code examples show how to use Amazon EC2 Auto Scaling with AWS SDKs. Each example calls an individual service function.

### Examples

- Create an Auto Scaling group using an AWS SDK (p. 685)
- Delete an Auto Scaling group using an AWS SDK (p. 689)
- Disable CloudWatch metrics collection for an Auto Scaling group using an AWS SDK (p. 692)
- Enable CloudWatch metrics collection for an Auto Scaling group using an AWS SDK (p. 694)
- Get information about Auto Scaling groups using an AWS SDK (p. 696)
- Get information about Auto Scaling instances using an AWS SDK (p. 700)
- Get information about Auto Scaling activities using an AWS SDK (p. 702)
- Set the desired capacity of an Auto Scaling group using an AWS SDK (p. 705)
- Terminate an instance in an Auto Scaling group using an AWS SDK (p. 707)
- Update an Auto Scaling group using an AWS SDK (p. 710)

## Create an Auto Scaling group using an AWS SDK

The following code examples show how to create an Auto Scaling group.

## Scenarios for Amazon EC2 Auto Scaling using AWS SDKs

The following code examples show how to use Amazon EC2 Auto Scaling with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Manage Auto Scaling groups and instances using an AWS SDK \(p. 713\)](#)

## Manage Auto Scaling groups and instances using an AWS SDK

The following code examples show how to:

- Create an Amazon EC2 Auto Scaling group and configure it with a launch template and Availability Zones.
- Get information about the group and running instances.
- Enable Amazon CloudWatch metrics collection on the group.
- Update the desired capacity of the group and wait for an instance to start.
- Terminate an instance in the group.
- List scaling activities that occur in response to user requests and capacity changes.
- Get statistics for CloudWatch metrics that are collected during the example.
- Stop collecting metrics, terminate all instances, and delete the group.

Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/**  
 * Before running this SDK for Java (v2) code example, set up your development  
environment, including your credentials.  
*  
* For more information, see the following documentation:  
*  
* https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html  
*  
* In addition, create a launch template. For more information, see the following  
topic:  
*  
* https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ec2-launch-templates.html#create-launch-template  
*  
* This code example performs the following operations:  
* 1. Creates an Auto Scaling group using an AutoScalingWaiter.  
* 2. Gets a specific Auto Scaling group and returns an instance Id value.  
* 3. Describes Auto Scaling with the Id value.  
* 4. Enables metrics collection.  
* 5. Update an Auto Scaling group.  
* 6. Describes Account details.  
* 7. Describe account details"  
* 8. Updates an Auto Scaling group to use an additional instance.  
* 9. Gets the specific Auto Scaling group and gets the number of instances.  
* 10. List the scaling activities that have occurred for the group.  
* 11. Terminates an instance in the Auto Scaling group.  
* 12. Stops the metrics collection.  
* 13. Deletes the Auto Scaling group.

## Run an Amazon EMR job flow using an AWS SDK

The following code example shows how to run an Amazon EMR job flow.

Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
def run_job_flow(
    name, log_uri, keep_alive, applications, job_flow_role, service_role,
    security_groups, steps, emr_client):
    """
    Runs a job flow with the specified steps. A job flow creates a cluster of
    instances and adds steps to be run on the cluster. Steps added to the cluster
    are run as soon as the cluster is ready.

    This example uses the 'emr-5.30.1' release. A list of recent releases can be
    found here:
        https://docs.aws.amazon.com/emr/latest/ReleaseGuide/emr-release-
    components.html.
    """
    # ... (code for creating cluster and adding steps)
```

```

:param name: The name of the cluster.
:param log_uri: The URI where logs are stored. This can be an Amazon S3 bucket
URL,
        such as 's3://my-log-bucket'.
:param keep_alive: When True, the cluster is put into a Waiting state after all
steps are run. When False, the cluster terminates itself
when
        the step queue is empty.
:param applications: The applications to install on each instance in the
cluster,
        such as Hive or Spark.
:param job_flow_role: The IAM role assumed by the cluster.
:param service_role: The IAM role assumed by the service.
:param security_groups: The security groups to assign to the cluster instances.
        Amazon EMR adds all needed rules to these groups, so
        they can be empty if you require only the default
rules.
:param steps: The job flow steps to add to the cluster. These are run in order
        when the cluster is ready.
:param emr_client: The Boto3 EMR client object.
:return: The ID of the newly created cluster.

## Cross-service examples for Amazon EMR using AWS SDKs

The following code examples show how to use Amazon EMR with AWS SDKs. Each example contains a sample application that works across multiple AWS services.

### Examples

- [Create a long-lived Amazon EMR cluster and run several steps using an AWS SDK \(p. 752\)](#)
- [Create a short-lived Amazon EMR cluster and run a step using an AWS SDK \(p. 752\)](#)

## Create a long-lived Amazon EMR cluster and run several steps using an AWS SDK

The following code example shows how to create a long-lived Amazon EMR cluster and run several steps.

### Python

#### SDK for Python (Boto3)

Create a long-lived Amazon EMR cluster that uses Apache Spark to query historical Amazon review data from the [Amazon Customer Reviews Dataset](#). Run a job that gets data for top-rated products in specific categories that contain keywords in their product titles. Job results are written to an Amazon Simple Storage Service (Amazon S3) bucket.

- Create an Amazon S3 bucket and upload a job script.
- Create AWS Identity and Access Management (IAM) roles.
- Create Amazon Elastic Compute Cloud (Amazon EC2) security groups.
- Create a long-lived cluster and run several job steps.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon EC2
- Amazon EMR
- IAM
- Amazon S3

## Create a short-lived Amazon EMR cluster and run a step using an AWS SDK

The following code example shows how to create a short-lived Amazon EMR cluster that runs a step and automatically terminates after the step completes.

### Python

#### SDK for Python (Boto3)

Create a short-lived Amazon EMR cluster that estimates the value of pi using Apache Spark to parallelize a large number of calculations. The job writes output to Amazon EMR logs and

to an Amazon Simple Storage Service (Amazon S3) bucket. The cluster terminates itself after completing the job.

- Create an Amazon S3 bucket and upload a job script.
- Create AWS Identity and Access Management (IAM) roles.
- Create Amazon Elastic Compute Cloud (Amazon EC2) security groups.
- Create a short-lived cluster and run a single job step.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### **Services used in this example**

- Amazon EC2
- Amazon EMR
- IAM
- Amazon S3

## Code examples for EventBridge using AWS SDKs

The following code examples show how to use Amazon EventBridge with an AWS software development kit (SDK).

#### **Code examples**

- [Actions for EventBridge using AWS SDKs \(p. 753\)](#)
  - Add a Lambda function target using an AWS SDK (p. 753)
  - Create an EventBridge scheduled rule using an AWS SDK (p. 756)
  - Delete an EventBridge scheduled rule using an AWS SDK (p. 759)
  - Send EventBridge events using an AWS SDK (p. 760)
- [Scenarios for EventBridge using AWS SDKs \(p. 764\)](#)
  - Create and trigger a rule in Amazon EventBridge using an AWS SDK (p. 764)
- [Cross-service examples for EventBridge using AWS SDKs \(p. 778\)](#)
  - Use scheduled events to invoke a Lambda function (p. 778)

## Actions for EventBridge using AWS SDKs

The following code examples show how to use Amazon EventBridge with AWS SDKs. Each example calls an individual service function.

#### **Examples**

- [Add a Lambda function target using an AWS SDK \(p. 753\)](#)
- [Create an EventBridge scheduled rule using an AWS SDK \(p. 756\)](#)
- [Delete an EventBridge scheduled rule using an AWS SDK \(p. 759\)](#)
- [Send EventBridge events using an AWS SDK \(p. 760\)](#)

## Add a Lambda function target using an AWS SDK

The following code examples show how to add an AWS Lambda function target to an Amazon EventBridge event.

## C++

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Include the required files.

```
#include <aws/core/Aws.h>
#include <aws/events/EventBridgeClient.h>
#include <aws/events/model/PutTargetsRequest.h>
#include <aws/events/model/PutTargetsResult.h>
#include <aws/core/utils/Outcome.h>
#include <iostream>
```

Add the target.

```
Aws::CloudWatchEvents::EventBridgeClient cwe;

Aws::CloudWatchEvents::Model::Target target;
target.SetArn(lambda_arn);
target.SetId(target_id);

Aws::CloudWatchEvents::Model::PutTargetsRequest request;
request.SetRule(rule_name);
request.AddTargets(target);

auto putTargetsOutcome = cwe.PutTargets(request);
if (!putTargetsOutcome.IsSuccess())
{
    std::cout << "Failed to create CloudWatch events target for rule "
        << rule_name << ":" <<
        putTargetsOutcome.GetError().GetMessage() << std::endl;
}
else
{
    std::cout <<
        "Successfully created CloudWatch events target for rule "
        << rule_name << std::endl;
}
```

## JavaScript

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { EventBridgeClient } from "@aws-sdk/client-eventbridge";
// Set the AWS Region.
```

```
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon EventBridge service client object.
export const ebClient = new EventBridgeClient({ region: REGION });
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js.
import { PutTargetsCommand } from "@aws-sdk/client-eventbridge";
import { ebClient } from "./libs/eventBridgeClient.js";

// Set the parameters.
export const params = {
  Rule: "DEMO_EVENT",
  Targets: [
    {
      Arn: "LAMBDA_FUNCTION_ARN", //LAMBDA_FUNCTION_ARN
      Id: "myCloudWatchEventsTarget",
    },
  ],
};

export const run = async () => {
  try {
    const data = await ebClient.send(new PutTargetsCommand(params));
    console.log("Success, target added; requestID: ", data);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
// Uncomment this line to run execution within this file.
// run();
```

- For API details, see [PutTargets](#) in *AWS SDK for JavaScript API Reference*.

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create CloudWatchEvents service object
var ebevents = new AWS.EventBridge({apiVersion: '2015-10-07'});

var params = {
  Rule: 'DEMO_EVENT',
  Targets: [
    {
      Arn: 'LAMBDA_FUNCTION_ARN',
      Id: 'myEventBridgeTarget',
    }
  ]
};
```

```
ebevents.putTargets(params, function(err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data);
  }
});
```

## Send EventBridge events using an AWS SDK

The following code examples show how to send Amazon EventBridge events.

C++

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Include the required files.

```
#include <aws/core/Aws.h>  
#include <aws/events/EventBridgeClient.h>  
#include <aws/events/model/PutEventsRequest.h>  
#include <aws/events/model/PutEventsResult.h>  
#include <aws/core/utils/Outcome.h>  
#include <iostream>
```

Send the event.

```
Aws::CloudWatchEvents::EventBridgeClient cwe;

Aws::CloudWatchEvents::Model::PutEventsRequestEntry event_entry;
event_entry.SetDetail(MakeDetails(event_key, event_value));
event_entry.SetDetailType("sampleSubmitted");
event_entry.AddResources(resource_arn);
event_entry.SetSource("aws-sdk-cpp-cloudwatch-example");

Aws::CloudWatchEvents::Model::PutEventsRequest request;
request.AddEntries(event_entry);

auto outcome = cwe.PutEvents(request);
if (!outcome.IsSuccess())
{
    std::cout << "Failed to post CloudWatch event: " <<
        outcome.GetError().GetMessage() << std::endl;
}
else
{
    std::cout << "Successfully posted CloudWatch event" << std::endl;
}
```

- For API details, see [PutEvents](#) in *AWS SDK for C++ API Reference*.

## Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void putEBEvents(EventBridgeClient eventBrClient, String
resourceArn, String resourceArn2 ) {

    try {
        // Populate a List with the resource ARN values.
        List<String> resources = new ArrayList<>();
        resources.add(resourceArn);
        resources.add(resourceArn2);

        PutEventsRequestEntry reqEntry = PutEventsRequestEntry.builder()
            .resources(resources)
            .source("com.mycompany.myapp")
            .detailType("myDetailType")
            .detail("{ \"key1\": \"value1\", \"key2\": \"value2\" }")
            .build();

        PutEventsRequest eventsRequest = PutEventsRequest.builder()
            .entries(reqEntry)
            .build();

        PutEventsResponse result = eventBrClient.putEvents(eventsRequest);
        for (PutEventsResultEntry resultEntry : result.entries()) {
            if (resultEntry.eventId() != null) {
                System.out.println("Event Id: " + resultEntry.eventId());
            } else {
                System.out.println("Injection failed with Error Code: " +
resultEntry.errorCode());
            }
        }
    }
}
```

```
        } catch (EventBridgeException e) {
            System.err.println(e.awsErrorDetails().errorMessage());
            System.exit(1);
        }
    }

## JavaScript

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { EventBridgeClient } from "@aws-sdk/client-eventbridge";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon EventBridge service client object.
export const ebClient = new EventBridgeClient({ region: REGION });
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js.
import { PutEventsCommand } from "@aws-sdk/client-eventbridge";
import { ebClient } from "./libs/eventBridgeClient.js";

// Set the parameters.
export const params = {
    Entries: [
        {
            Detail: '{ "key1": "value1", "key2": "value2" }',
            DetailType: "appRequestSubmitted",
            Resources: [
                "RESOURCE_ARN", //RESOURCE_ARN
            ],
            Source: "com.company.app",
        },
    ],
};

export const run = async () => {
    try {
        const data = await ebClient.send(new PutEventsCommand(params));
        console.log("Success, event sent; requestID:", data);
        return data; // For unit tests.
    } catch (err) {
        console.log("Error", err);
    }
};
// Uncomment this line to run execution within this file.
// run();
```

## Scenarios for EventBridge using AWS SDKs

The following code examples show how to use Amazon EventBridge with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Create and trigger a rule in Amazon EventBridge using an AWS SDK \(p. 764\)](#)

## Create and trigger a rule in Amazon EventBridge using an AWS SDK

The following code example shows how to create and trigger a rule in Amazon EventBridge.

Ruby

### SDK for Ruby

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Call the functions in the correct order.

```
require "aws-sdk-sns"
require "aws-sdk-iam"
require "aws-sdk-cloudwatchevents"
require "aws-sdk-ec2"
require "aws-sdk-cloudwatch"
require "aws-sdk-cloudwatchlogs"
require "securerandom"
```

Checks whether the specified Amazon Simple Notification Service (Amazon SNS) topic exists among those provided to this function.

```
# Checks whether the specified Amazon SNS
# topic exists among those provided to this function.
# This is a helper function that is called by the topic_exists? function.
#
# @param topics [Array] An array of Aws::SNS::Types::Topic objects.
# @param topic_arn [String] The ARN of the topic to find.
# @return [Boolean] true if the topic ARN was found; otherwise, false.
# @example
#   sns_client = Aws::SNS::Client.new(region: 'us-east-1')
#   response = sns_client.list_topics
#   if topic_found?(response.topics,
#     'arn:aws:sns:us-east-1:111111111111:aws-doc-sdk-examples-topic'
#   )
#     puts 'Topic found.'
#   end
#
def topic_found?(topics, topic_arn)
  topics.each do |topic|
    return true if topic.topic_arn == topic_arn
  end
  return false
end
```

Checks whether the specified topic exists among those available to the caller in Amazon SNS.

```
# Checks whether the specified topic exists among those available to the
# caller in Amazon SNS.
#
# @param sns_client [Aws::SNS::Client] An initialized Amazon SNS client.
# @param topic_arn [String] The ARN of the topic to find.
# @return [Boolean] true if the topic ARN was found; otherwise, false.
# @example
#   exit 1 unless topic_exists?(
#     Aws::SNS::Client.new(region: 'us-east-1'),
#     'arn:aws:sns:us-east-1:111111111111:aws-doc-sdk-examples-topic'
#   )
def topic_exists?(sns_client, topic_arn)
  puts "Searching for topic with ARN '#{topic_arn}'..."
  response = sns_client.list_topics
  if response.topics.count.positive?
    if topic_found?(response.topics, topic_arn)
      puts "Topic found."
      return true
    end
    while response.next_page? do
      response = response.next_page
      if response.topics.count.positive?
        if topic_found?(response.topics, topic_arn)
          puts "Topic found."
          return true
        end
      end
    end
  end
  puts "Topic not found."
  return false
rescue StandardError => e
  puts "Topic not found: #{e.message}"
  return false
end
```

Create a topic in Amazon SNS and then subscribe an email address to receive notifications to that topic.

```
# Creates a topic in Amazon SNS
# and then subscribes an email address to receive notifications to that topic.
#
# @param sns_client [Aws::SNS::Client] An initialized Amazon SNS client.
# @param topic_name [String] The name of the topic to create.
# @param email_address [String] The email address of the recipient to notify.
# @return [String] The ARN of the topic that was created.
# @example
#   puts create_topic(
#     Aws::SNS::Client.new(region: 'us-east-1'),
#     'aws-doc-sdk-examples-topic',
#     'mary@example.com'
#   )
def create_topic(sns_client, topic_name, email_address)
  puts "Creating the topic named '#{topic_name}'..."

## Cross-service examples for EventBridge using AWS SDKs

The following code examples show how to use Amazon EventBridge with AWS SDKs. Each example contains a sample application that works across multiple AWS services.

### Examples

- [Use scheduled events to invoke a Lambda function \(p. 778\)](#)

## Use scheduled events to invoke a Lambda function

The following code examples show how to create an AWS Lambda function invoked by an Amazon EventBridge scheduled event.

Java

### SDK for Java 2.x

Shows how to create an Amazon EventBridge scheduled event that invokes an AWS Lambda function. Configure EventBridge to use a cron expression to schedule when the Lambda function is invoked. In this example, you create a Lambda function by using the Lambda Java runtime API. This example invokes different AWS services to perform a specific use case. This example demonstrates how to create an app that sends a mobile text message to your employees that congratulates them at the one year anniversary date.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- DynamoDB
- EventBridge
- Lambda
- Amazon SNS

## JavaScript

### SDK for JavaScript V3

Shows how to create an Amazon EventBridge scheduled event that invokes an AWS Lambda function. Configure EventBridge to use a cron expression to schedule when the Lambda function is invoked. In this example, you create a Lambda function by using the Lambda JavaScript runtime API. This example invokes different AWS services to perform a specific use case. This example demonstrates how to create an app that sends a mobile text message to your employees that congratulates them at the one year anniversary date.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

This example is also available in the [AWS SDK for JavaScript v3 developer guide](#).

#### Services used in this example

- DynamoDB
- EventBridge
- Lambda
- Amazon SNS

## Python

### SDK for Python (Boto3)

This example shows how to register an AWS Lambda function as the target of a scheduled Amazon EventBridge event. The Lambda handler writes a friendly message and the full event data to Amazon CloudWatch Logs for later retrieval.

- Deploys a Lambda function.
- Creates an EventBridge scheduled event and makes the Lambda function the target.
- Grants permission to let EventBridge invoke the Lambda function.
- Prints the latest data from CloudWatch Logs to show the result of the scheduled invocations.
- Cleans up all resources created during the demo.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- CloudWatch Logs
- EventBridge
- Lambda

# Code examples for AWS Glue using AWS SDKs

The following code examples show how to use AWS Glue with an AWS software development kit (SDK).

## Code examples

- [Actions for AWS Glue using AWS SDKs \(p. 780\)](#)

- [Create an AWS Glue crawler using an AWS SDK \(p. 780\)](#)
- [Create an AWS Glue job definition using an AWS SDK \(p. 785\)](#)
- [Delete an AWS Glue crawler using an AWS SDK \(p. 788\)](#)
- [Delete a database from the AWS Glue Data Catalog using an AWS SDK \(p. 790\)](#)
- [Delete an AWS Glue job definition using an AWS SDK \(p. 792\)](#)
- [Delete a table from an AWS Glue Data Catalog database using an AWS SDK \(p. 794\)](#)
- [Get an AWS Glue crawler using an AWS SDK \(p. 796\)](#)
- [Get a database from the AWS Glue Data Catalog using an AWS SDK \(p. 799\)](#)
- [Get an AWS Glue job run using an AWS SDK \(p. 802\)](#)
- [Get database list from the AWS Glue Data Catalog using an AWS SDK \(p. 804\)](#)
- [Get a job from the AWS Glue Data Catalog using an AWS SDK \(p. 804\)](#)
- [Get runs of an AWS Glue job using an AWS SDK \(p. 805\)](#)
- [Get tables from a database in the AWS Glue Data Catalog using an AWS SDK \(p. 807\)](#)
- [List AWS Glue job definitions using an AWS SDK \(p. 810\)](#)
- [Start an AWS Glue crawler using an AWS SDK \(p. 811\)](#)
- [Start an AWS Glue job run using an AWS SDK \(p. 814\)](#)
- [Scenarios for AWS Glue using AWS SDKs \(p. 817\)](#)
  - [Get started running AWS Glue crawlers and jobs using an AWS SDK \(p. 817\)](#)

## Actions for AWS Glue using AWS SDKs

The following code examples show how to use AWS Glue with AWS SDKs. Each example calls an individual service function.

### Examples

- [Create an AWS Glue crawler using an AWS SDK \(p. 780\)](#)
- [Create an AWS Glue job definition using an AWS SDK \(p. 785\)](#)
- [Delete an AWS Glue crawler using an AWS SDK \(p. 788\)](#)
- [Delete a database from the AWS Glue Data Catalog using an AWS SDK \(p. 790\)](#)
- [Delete an AWS Glue job definition using an AWS SDK \(p. 792\)](#)
- [Delete a table from an AWS Glue Data Catalog database using an AWS SDK \(p. 794\)](#)
- [Get an AWS Glue crawler using an AWS SDK \(p. 796\)](#)
- [Get a database from the AWS Glue Data Catalog using an AWS SDK \(p. 799\)](#)
- [Get an AWS Glue job run using an AWS SDK \(p. 802\)](#)
- [Get database list from the AWS Glue Data Catalog using an AWS SDK \(p. 804\)](#)
- [Get a job from the AWS Glue Data Catalog using an AWS SDK \(p. 804\)](#)
- [Get runs of an AWS Glue job using an AWS SDK \(p. 805\)](#)
- [Get tables from a database in the AWS Glue Data Catalog using an AWS SDK \(p. 807\)](#)
- [List AWS Glue job definitions using an AWS SDK \(p. 810\)](#)
- [Start an AWS Glue crawler using an AWS SDK \(p. 811\)](#)
- [Start an AWS Glue job run using an AWS SDK \(p. 814\)](#)

## Create an AWS Glue crawler using an AWS SDK

The following code examples show how to create an AWS Glue crawler.

.NET

## AWS SDK for .NET

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Creates an AWS Glue crawler.
/// </summary>
/// <param name="glueClient">The initialized AWS Glue client.</param>
/// <param name="iam">The Amazon Resource Name (ARN) of the IAM role
/// that is used by the crawler.</param>
/// <param name="s3Path">The path to the Amazon S3 bucket where
/// data is stored.</param>
/// <param name="cron">The name of the CRON job that runs the crawler.</param>
/// <param name="dbName">The name of the database.</param>

## Scenarios for AWS Glue using AWS SDKs

The following code examples show how to use AWS Glue with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Get started running AWS Glue crawlers and jobs using an AWS SDK \(p. 817\)](#)

## Get started running AWS Glue crawlers and jobs using an AWS SDK

The following code examples show how to:

- Create and run a crawler that crawls a public Amazon Simple Storage Service (Amazon S3) bucket and generates a metadata database that describes the CSV-formatted data it finds.
- List information about databases and tables in your AWS Glue Data Catalog.
- Create and run a job that extracts CSV data from the source Amazon S3 bucket, transforms it by removing and renaming fields, and loads JSON-formatted output into another Amazon S3 bucket.
- List information about job runs and view some of the transformed data.
- Delete all resources created by the demo.

For more information, see [Tutorial: Getting started with AWS Glue Studio](#).

.NET

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a class that wraps AWS Glue functions that are used in the scenario.

```
namespace Glue_Basics
{
```

```

    ///<summary>
    /// Methods for working the AWS Glue by using the AWS SDK for .NET (v3.7).
    /// </summary>
    public static class GlueMethods
    {

        ///<summary>
        /// Creates a database for use by an AWS Glue crawler.
        /// </summary>
        ///<param name="glueClient">The initialized AWS Glue client.</param>
        ///<param name="dbName">The name of the new database.</param>
        ///<param name="locationUri">The location of scripts that will be
        /// used by the AWS Glue crawler.</param>
        ///<returns>A Boolean value indicating whether the AWS Glue database
        /// was created successfully.</returns>
        public static async Task<bool> CreateDatabaseAsync(AmazonGlueClient
glueClient, string dbName, string locationUri)
        {
            try
            {
                var DataBaseInput = new DatabaseInput
                {
                    Description = "Built with the AWS SDK for .NET (v3)",
                    Name = dbName,
                    LocationUri = locationUri,
                };

                var request = new CreateDatabaseRequest
                {
                    DatabaseInput = DataBaseInput,

## JavaScript

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create and run a crawler that crawls a public Amazon Simple Storage Service (Amazon S3) bucket and generates a metadata database that describes the CSV-formatted data it finds.

```
const createCrawler = (name, role, dbName, tablePrefix, s3TargetPath) => {
  const client = new GlueClient({ region: DEFAULT_REGION });

  const command = new CreateCrawlerCommand({
    Name: name,
    Role: role,
    DatabaseName: dbName,
    TablePrefix: tablePrefix,
    Targets: [
      S3Targets: [{ Path: s3TargetPath }],
    ],
  });

  return client.send(command);
};

const getCrawler = (name) => {
  const client = new GlueClient({ region: DEFAULT_REGION });

  const command = new GetCrawlerCommand({
    Name: name,
  });

  return client.send(command);
};

const startCrawler = (name) => {
  const client = new GlueClient({ region: DEFAULT_REGION });

  const command = new StartCrawlerCommand({
    Name: name,
```

```
});

    return client.send(command);
};

const crawlerExists = async ({ getcrawler }, crawlerName) => {
    try {
        await getcrawler(crawlerName);
        return true;
    } catch {
        return false;
    }
};

const makeCreateCrawlerStep = (actions) => async (context) => {
    if (await crawlerExists(actions, process.env.CRAWLER_NAME)) {
        log("Crawler already exists. Skipping creation.");
    } else {
        await actions.createcrawler(
            process.env.CRAWLER_NAME,
            process.env.ROLE_NAME,
            process.env.DATABASE_NAME,
            process.env.TABLE_PREFIX,
            process.env.S3_TARGET_PATH
        );

        log("Crawler created successfully.", { type: "success" });
    }

    return { ...context };
};

const waitForCrawler = async (getcrawler, crawlerName) => {
    const waitTimeInSeconds = 30;
    const { Crawler } = await getcrawler(crawlerName);

    if (!Crawler) {
        throw new Error(`Crawler with name ${crawlerName} not found.`);
    }

    if (Crawler.State === "READY") {
        return;
    }

    log(`Crawler is ${Crawler.State}. Waiting ${waitTimeInSeconds} seconds...`);
    await wait(waitTimeInSeconds);
    return waitForCrawler(getcrawler, crawlerName);
};

const makeStartCrawlerStep =
    ({ startCrawler, getcrawler }) => {
        async (context) => {
            log("Starting crawler.");
            await startCrawler(process.env.CRAWLER_NAME);
            log("Crawler started.", { type: "success" });

            log("Waiting for crawler to finish running. This can take a while.");
            await waitForCrawler(getcrawler, process.env.CRAWLER_NAME);
            log("Crawler ready.", { type: "success" });

            return { ...context };
        };
    };
}
```

---

List information about databases and tables in your AWS Glue Data Catalog.

```

const getDatabase = (name) => {

Kotlin

## SDK for Kotlin

### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun main(args: Array<String>) {

    val usage = """
        Usage:
            <iام> <s3Path> <cron> <dbName> <crawlerName> <jobName> <scriptLocation>
            <locationUri>

        Where:
            iam - The Amazon Resource Name (ARN) of the AWS Identity and Access Management (IAM) role that has AWS Glue and Amazon Simple Storage Service (Amazon S3) permissions.
            s3Path - The Amazon Simple Storage Service (Amazon S3) target that contains data (for example, CSV data).
            cron - A cron expression used to specify the schedule (for example, cron(15 12 * * ? *)).
            dbName - The database name.
            crawlerName - The name of the crawler.
            jobName - The name you assign to this job definition.
            scriptLocation - Specifies the Amazon S3 path to a script that runs a job.
            locationUri - Specifies the location of the database
        """

## JavaScript

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
const REGION = "REGION"; // For example, "us-east-1".
// Create an IAM service client object.
const iamClient = new IAMClient({ region: REGION });
export { iamClient };
```

Attach the policy.

```
// Import required AWS SDK clients and commands for Node.js.
import { iamClient } from "./libs/iamClient.js";
import {
  ListAttachedRolePoliciesCommand,
  AttachRolePolicyCommand,
} from "@aws-sdk/client-iam";

// Set the parameters.
const ROLENAMESPACE = "ROLE_NAME";
const paramsRoleList = { RoleName: ROLENAMESPACE }; //ROLE_NAME
export const params = {
  PolicyArn: "arn:aws:iam::aws:policy/AmazonDynamoDBFullAccess",
  RoleName: ROLENAMESPACE,
};
export const run = async () => {
  try {
    const data = await iamClient.send(
      new ListAttachedRolePoliciesCommand(paramsRoleList)
    );
    const myRolePolicies = data.AttachedPolicies;
    myRolePolicies.forEach(function (_val, index) {
      if (myRolePolicies[index].PolicyName === "AmazonDynamoDBFullAccess") {
        console.log(
          "AmazonDynamoDBFullAccess is already attached to this role."
        );
        process.exit();
      }
    });
    try {
      const data = await iamClient.send(new AttachRolePolicyCommand(params));
      console.log("Role attached successfully");
      return data;
    } catch (err) {
      console.log("Error", err);
    }
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

## JavaScript

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";  
// Set the AWS Region.  
const REGION = "REGION"; // For example, "us-east-1".
```

```
// Create an IAM service client object.  
const iamClient = new IAMClient({ region: REGION });  
export { iamClient };
```

Create the policy.

```
// Import required AWS SDK clients and commands for Node.js.  
import { iamClient } from "./libs/iamClient.js";  
import { CreatePolicyCommand } from "@aws-sdk/client-iam";  
  
// Set the parameters.  
const myManagedPolicy = {  
    Version: "2012-10-17",  
    Statement: [  
        {  
            Effect: "Allow",  
            Action: "logs:CreateLogGroup",  
            Resource: "RESOURCE_ARN", // RESOURCE_ARN  
        },  
        {  
            Effect: "Allow",  
            Action: [  
                "dynamodb>DeleteItem",  
                "dynamodb>GetItem",  
                "dynamodb>PutItem",  
                "dynamodb>Scan",  
                "dynamodb>UpdateItem",  
            ],  
            Resource: "DYNAMODB_POLICY_NAME", // DYNAMODB_POLICY_NAME; For example,  
            "myDynamoDBName".  
        },  
    ],  
};  
export const params = {  
    PolicyDocument: JSON.stringify(myManagedPolicy),

## Scenarios for IAM using AWS SDKs

The following code examples show how to use AWS Identity and Access Management with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Create an IAM user and assume a role with AWS STS using an AWS SDK \(p. 1027\)](#)
- [Create read-only and read-write IAM users using an AWS SDK \(p. 1078\)](#)
- [Manage IAM access keys using an AWS SDK \(p. 1084\)](#)
- [Manage IAM policies using an AWS SDK \(p. 1087\)](#)
- [Manage IAM roles using an AWS SDK \(p. 1090\)](#)
- [Manage your IAM account using an AWS SDK \(p. 1093\)](#)
- [Roll back an IAM policy version using an AWS SDK \(p. 1097\)](#)

## Create an IAM user and assume a role with AWS STS using an AWS SDK

The following code examples show how to:

- Create a user who has no permissions.
- Create a role that grants permission to list Amazon S3 buckets for the account.
- Add a policy to let the user assume the role.
- Assume the role and list Amazon S3 buckets using temporary credentials.
- Delete the policy, role, and user.

.NET
