## Scenarios for Amazon SQS using AWS SDKs

The following code examples show how to use Amazon Simple Queue Service with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Send and receive batches of messages with Amazon SQS using an AWS SDK \(p. 2084\)](#)

## Send and receive batches of messages with Amazon SQS using an AWS SDK

The following code example shows how to:

- Create an Amazon SQS queue.
- Send batches of messages to the queue.
- Receive batches of messages from the queue.
- Delete batches of messages from the queue.

### Python

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create functions to wrap Amazon SQS message functions.

```
import logging
import sys

import boto3
from botocore.exceptions import ClientError

import queue_wrapper

logger = logging.getLogger(__name__)
sqS = boto3.resource('sqS')

def send_messages(queue, messages):
    """
        Send a batch of messages in a single request to an SQS queue.
        This request may return overall success even when some messages were not sent.
        The caller must inspect the Successful and Failed lists in the response and
        resend any failed messages.

        :param queue: The queue to receive the messages.
        :param messages: The messages to send to the queue. These are simplified to
                         contain only the message body and attributes.
        :return: The response from SQS that contains the list of successful and failed
    
```

```

        messages.

"""
try:
    entries = [
        'Id': str(ind),
        'MessageBody': msg['body'],
        'MessageAttributes': msg['attributes']
    } for ind, msg in enumerate(messages)]
    response = queue.send_messages(Entries=entries)
    if 'Successful' in response:
        for msg_meta in response['Successful']:
            logger.info(
                "Message sent: %s: %s",
                msg_meta['MessageId'],
                messages[int(msg_meta['Id'])]['body']
            )
    if 'Failed' in response:
        for msg_meta in response['Failed']:
            logger.warning(
                "Failed to send: %s: %s",
                msg_meta['MessageId'],
                messages[int(msg_meta['Id'])]['body']
            )
except ClientError as error:
    logger.exception("Send messages failed to queue: %s", queue)
    raise error
else:
    return response

def receive_messages(queue, max_number, wait_time):
    """
    Receive a batch of messages in a single request from an SQS queue.

    :param queue: The queue from which to receive messages.
    :param max_number: The maximum number of messages to receive. The actual number
                       of messages received might be less.
    :param wait_time: The maximum time to wait (in seconds) before returning. When
                      this number is greater than zero, long polling is used. This
                      can result in reduced costs and fewer false empty responses.
    :return: The list of Message objects received. These each contain the body
            of the message and metadata and custom attributes.
    """
    try:
        messages = queue.receive_messages(
            MessageAttributeNames=['All'],

## Cross-service examples for Amazon SQS using AWS SDKs

The following code examples show how to use Amazon Simple Queue Service with AWS SDKs. Each example contains a sample application that works across multiple AWS services.

### Examples

- [Create a web application that sends and retrieves messages by using the Amazon Simple Queue Service API \(p. 2087\)](#)
- [Create a messenger application with Step Functions \(p. 2088\)](#)
- [Create an Amazon Textract explorer application \(p. 2089\)](#)
- [Detect people and objects in a video with Amazon Rekognition using an AWS SDK \(p. 2090\)](#)

### Create a web application that sends and retrieves messages by using the Amazon Simple Queue Service API

The following code examples show how to create a messaging application by using the Amazon Simple Queue Service API.

Java

### SDK for Java 2.x

Shows how to use the Amazon Simple Queue Service API to develop a Spring REST API that sends and retrieves messages.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Comprehend
- Amazon SQS

Kotlin

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

Shows how to use the Amazon Simple Queue Service API to develop a Spring REST API that sends and retrieves messages.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Comprehend
- Amazon SQS

## Create a messenger application with Step Functions

The following code example shows how to create an AWS Step Functions messenger application that retrieves message records from a database table.

Python

### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) with AWS Step Functions to create a messenger application that retrieves message records from an Amazon DynamoDB table and sends them with Amazon Simple Queue Service (Amazon SQS). The state machine integrates with an AWS Lambda function to scan the database for unsent messages.

- Create a state machine that retrieves and updates message records from an Amazon DynamoDB table.
- Update the state machine definition to also send messages to Amazon Simple Queue Service (Amazon SQS).
- Start and stop state machine runs.
- Connect to Lambda, DynamoDB, and Amazon SQS from a state machine by using service integrations.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- DynamoDB
- Lambda
- Amazon SQS
- Step Functions

## Create an Amazon Textract explorer application

The following code examples show how to explore Amazon Textract output through an interactive application.

JavaScript

### SDK for JavaScript V3

Shows how to use the AWS SDK for JavaScript to build a React application that uses Amazon Textract to extract data from a document image and display it in an interactive web page. This example runs in a web browser and requires an authenticated Amazon Cognito identity for credentials. It uses Amazon Simple Storage Service (Amazon S3) for storage, and for notifications it polls an Amazon Simple Queue Service (Amazon SQS) queue that is subscribed to an Amazon Simple Notification Service (Amazon SNS) topic.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Cognito Identity
- Amazon S3
- Amazon SNS
- Amazon SQS
- Amazon Textract

Python

### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) with Amazon Textract to detect text, form, and table elements in a document image. The input image and Amazon Textract output are shown in a Tkinter application that lets you explore the detected elements.

- Submit a document image to Amazon Textract and explore the output of detected elements.
- Submit images directly to Amazon Textract or through an Amazon Simple Storage Service (Amazon S3) bucket.
- Use asynchronous APIs to start a job that publishes a notification to an Amazon Simple Notification Service (Amazon SNS) topic when the job completes.
- Poll an Amazon Simple Queue Service (Amazon SQS) queue for a job completion message and display the results.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon S3

- Amazon SNS
- Amazon SQS
- Amazon Textract

## Detect people and objects in a video with Amazon Rekognition using an AWS SDK

The following code examples show how to detect people and objects in a video with Amazon Rekognition.

Python

### SDK for Python (Boto3)

Use Amazon Rekognition to detect faces, objects, and people in videos by starting asynchronous detection jobs. This example also configures Amazon Rekognition to notify an Amazon Simple Notification Service (Amazon SNS) topic when jobs complete and subscribes an Amazon Simple Queue Service (Amazon SQS) queue to the topic. When the queue receives a message about a job, the job is retrieved and the results are output.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Rekognition
- Amazon SNS
- Amazon SQS

## Code examples for AWS STS using AWS SDKs

The following code examples show how to use AWS Security Token Service with an AWS software development kit (SDK).

### Code examples

- [Actions for AWS STS using AWS SDKs \(p. 2090\)](#)
  - [Assume a role with AWS STS using an AWS SDK \(p. 2091\)](#)
  - [Get a session token with AWS STS using an AWS SDK \(p. 2096\)](#)
- [Scenarios for AWS STS using AWS SDKs \(p. 2097\)](#)
  - [Assume an IAM role that requires an MFA token with AWS STS using an AWS SDK \(p. 2097\)](#)
  - [Construct a URL with AWS STS for federated users using an AWS SDK \(p. 2101\)](#)
  - [Get a session token that requires an MFA token with AWS STS using an AWS SDK \(p. 2104\)](#)

## Actions for AWS STS using AWS SDKs

The following code examples show how to use AWS Security Token Service with AWS SDKs. Each example calls an individual service function.

### Examples

- [Assume a role with AWS STS using an AWS SDK \(p. 2091\)](#)

- Get a session token with AWS STS using an AWS SDK (p. 2096)

## Assume a role with AWS STS using an AWS SDK

The following code examples show how to assume a role with AWS STS.

Get a session token by passing an MFA token and use it to list Amazon S3 buckets for the account.

```
def list_buckets_with_session_token_with_mfa(mfa_serial_number, mfa_totp,  
sts_client):  
    """  
    Gets a session token with MFA credentials and uses the temporary session  
    credentials to list Amazon S3 buckets.  
  
    Requires an MFA device serial number and token.  
  
    :param mfa_serial_number: The serial number of the MFA device. For a virtual  
    MFA  
        device, this is an Amazon Resource Name (ARN).  
    :param mfa_totp: A time-based, one-time password issued by the MFA device.  
    :param sts_client: A Boto3 STS instance that has permission to assume the role.  
    """  
    if mfa_serial_number is not None:  
        response = sts_client.get_session_token(  
            SerialNumber=mfa_serial_number, TokenCode=mfa_totp)  
    else:  
        response = sts_client.get_session_token()  
    temp_credentials = response['Credentials']  
  
    s3_resource = boto3.resource(  
        's3',  
        aws_access_key_id=temp_credentials['AccessKeyId'],
```

```
aws_secret_access_key=temp_credentials['SecretAccessKey'],
aws_session_token=temp_credentials['SessionToken'])

print(f"Buckets for the account:")
for bucket in s3_resource.buckets.all():
    print(bucket.name)
```

- For API details, see [GetSessionToken](#) in *AWS SDK for Python (Boto3) API Reference*.

## Scenarios for AWS STS using AWS SDKs

The following code examples show how to use AWS Security Token Service with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Assume an IAM role that requires an MFA token with AWS STS using an AWS SDK \(p. 2097\)](#)
- [Construct a URL with AWS STS for federated users using an AWS SDK \(p. 2101\)](#)
- [Get a session token that requires an MFA token with AWS STS using an AWS SDK \(p. 2104\)](#)

## Assume an IAM role that requires an MFA token with AWS STS using an AWS SDK

The following code example shows how to:

- Create an IAM role that grants permission to list Amazon S3 buckets.
- Create an IAM user that has permission to assume the role only when MFA credentials are provided.
- Register an MFA device for the user.
- Assume the role and use temporary credentials to list S3 buckets.

### Python

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create an IAM user, register an MFA device, and create a role that grants permission to list S3 buckets. The user has rights only to assume the role.

```
def setup(iam_resource):
    """
    Creates a new user with no permissions.
    Creates a new virtual MFA device.
    Displays the QR code to seed the device.
    Asks for two codes from the MFA device.
    Registers the MFA device for the user.
    Creates an access key pair for the user.
    Creates a role with a policy that lets the user assume the role and requires
    MFA.
    Creates a policy that allows listing Amazon S3 buckets.
    Attaches the policy to the role.
    Creates an inline policy for the user that lets the user assume the role.

```

For demonstration purposes, the user is created in the same account as the role,  
but in practice the user would likely be from another account.

Any MFA device that can scan a QR code will work with this demonstration.  
Common choices are mobile apps like LastPass Authenticator,  
Microsoft Authenticator, or Google Authenticator.

```
:param iam_resource: A Boto3 AWS Identity and Access Management (IAM) resource
                    that has permissions to create users, roles, and policies
                    in the account.
:return: The newly created user, user key, virtual MFA device, and role.
"""

## Get a session token that requires an MFA token with AWS STS using an AWS SDK

The following code example shows how to:

- Create an IAM role that grants permission to list Amazon S3 buckets.
- Create an IAM user that has permission to assume the role only when MFA credentials are provided.
- Register an MFA device for the user.
- Provide MFA credentials to get a session token and use temporary credentials to list S3 buckets.

Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create an IAM user, register an MFA device, and create a role that grants permission to let the user list S3 buckets only when MFA credentials are used.

```
def setup(iam_resource):
    """
    Creates a new user with no permissions.
    Creates a new virtual multi-factor authentication (MFA) device.
    Displays the QR code to seed the device.
    Asks for two codes from the MFA device.
    Registers the MFA device for the user.
    Creates an access key pair for the user.
    Creates an inline policy for the user that lets the user list Amazon S3
    buckets,
    but only when MFA credentials are used.

    Any MFA device that can scan a QR code will work with this demonstration.
    Common choices are mobile apps like LastPass Authenticator,
    Microsoft Authenticator, or Google Authenticator.

    :param iam_resource: A Boto3 AWS Identity and Access Management (IAM) resource
        that has permissions to create users, MFA devices, and
        policies in the account.
    :return: The newly created user, user key, and virtual MFA device.
    """
    user = iam_resource.create_user(UserName=unique_name('user'))
    print(f"Created user {user.name}.")

    virtual_mfa_device = iam_resource.create_virtual_mfa_device(
        VirtualMFADeviceName=unique_name('mfa'))
    print(f"Created virtual MFA device {virtual_mfa_device.serial_number}")

    print(f"Showing the QR code for the device. Scan this in the MFA app of your "
          f"choice.")
    with open('qr.png', 'wb') as qr_file:
        qr_file.write(virtual_mfa_device.qr_code_png)
    webbrowser.open(qr_file.name)

    print(f"Enter two consecutive code from your MFA device.")
    mfa_code_1 = input("Enter the first code: ")
    mfa_code_2 = input("Enter the second code: ")
    user.enable_mfa(
        SerialNumber=virtual_mfa_device.serial_number,
        AuthenticationCode1=mfa_code_1,
```

```

        AuthenticationCode2=mfa_code_2)
os.remove(qr_file.name)
print(f"MFA device is registered with the user.")

user_key = user.create_access_key_pair()
print(f"Created access key pair for user.")

print(f"Wait for user to be ready.", end='')

## Scenarios for SageMaker using AWS SDKs

The following code examples show how to use Amazon SageMaker with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Get started with SageMaker models and endpoints using an AWS SDK \(p. 2118\)](#)

## Get started with SageMaker models and endpoints using an AWS SDK

The following code example shows how to:

- Start a training job.
- Create a SageMaker model.
- Create an endpoint configuration.
- Create an endpoint.
- Delete an endpoint.
- Delete an endpoint configuration.
- Delete a model.

## Code examples for Secrets Manager using AWS SDKs

The following code examples show how to use AWS Secrets Manager with an AWS software development kit (SDK).

### Code examples

- [Actions for Secrets Manager using AWS SDKs \(p. 2123\)](#)
  - [Create a Secrets Manager secret using an AWS SDK \(p. 2123\)](#)
  - [Delete a Secrets Manager secret using an AWS SDK \(p. 2126\)](#)
  - [Describe a Secrets Manager secret using an AWS SDK \(p. 2127\)](#)
  - [Get a random password from Secrets Manager using an AWS SDK \(p. 2129\)](#)
  - [Get a Secrets Manager secret value using an AWS SDK \(p. 2130\)](#)
  - [List Secrets Manager secrets using an AWS SDK \(p. 2135\)](#)

- Put a value in a Secrets Manager secret using an AWS SDK (p. 2137)
- Update the stage of a Secrets Manager secret version using an AWS SDK (p. 2139)
- Scenarios for Secrets Manager using AWS SDKs (p. 2140)
  - Create and manage a Secrets Manager secret using an AWS SDK (p. 2140)
- Cross-service examples for Secrets Manager using AWS SDKs (p. 2141)
  - Create a lending library REST API (p. 2141)

## Actions for Secrets Manager using AWS SDKs

The following code examples show how to use AWS Secrets Manager with AWS SDKs. Each example calls an individual service function.

### Examples

- Create a Secrets Manager secret using an AWS SDK (p. 2123)
- Delete a Secrets Manager secret using an AWS SDK (p. 2126)
- Describe a Secrets Manager secret using an AWS SDK (p. 2127)
- Get a random password from Secrets Manager using an AWS SDK (p. 2129)
- Get a Secrets Manager secret value using an AWS SDK (p. 2130)
- List Secrets Manager secrets using an AWS SDK (p. 2135)
- Put a value in a Secrets Manager secret using an AWS SDK (p. 2137)
- Update the stage of a Secrets Manager secret version using an AWS SDK (p. 2139)

## Create a Secrets Manager secret using an AWS SDK

The following code examples show how to create a Secrets Manager secret.

C++

### SDK for C++

#### Note

## Put a value in a Secrets Manager secret using an AWS SDK

The following code examples show how to put a value in a Secrets Manager secret.

Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static void updateMySecret(SecretsManagerClient secretsClient, String
secretName, String secretValue) {

    try {
        UpdateSecretRequest secretRequest = UpdateSecretRequest.builder()
            .secretId(secretName)
            .secretString(secretValue)
```

```
        .build();

        secretsClient.updateSecret(secretRequest);

    } catch (SecretsManagerException e) {
        System.err.println(e.awsErrorDetails().errorMessage());
        System.exit(1);
    }
}
```

- For API details, see [PutSecretValue](#) in *AWS SDK for Java 2.x API Reference*.

## Kotlin

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
suspend fun updateMySecret(secretName: String?, secretValue: String?) {

    val request = UpdateSecretRequest {
        secretId = secretName
        secretString = secretValue
    }

    SecretsManagerClient { region = "us-east-1" }.use { secretsClient ->
        secretsClient.updateSecret(request)
        println("The secret value was updated")
    }
}
```

- For API details, see [PutSecretValue](#) in *AWS SDK for Kotlin API reference*.

## Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
class SecretsManagerSecret:
    """Encapsulates Secrets Manager functions."""
    def __init__(self, secretsmanager_client):

## Scenarios for Secrets Manager using AWS SDKs

The following code examples show how to use AWS Secrets Manager with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Create and manage a Secrets Manager secret using an AWS SDK \(p. 2140\)](#)

## Create and manage a Secrets Manager secret using an AWS SDK

The following code example shows how to:

- Create a Secrets Manager secret.
- Generate a random password and update a secret.
- Get current and previous values of a secret.
- Store binary data in a secret.
- Delete a secret.

### Python

#### SDK for Python (Boto3)

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a secret, update its value and stage, and delete the secret.

```
def create_and_manage_secret_demo():  
    """  
        Shows how to use AWS Secrets Manager to create a secret, update its value and  
        stage, and delete it.  
    """  
    secret = SecretsManagerSecret(boto3.client('secretsmanager'))
```

```
print("Create a secret.")
secret.create("doc-example-secretsmanager-secret", "Shh, don't tell.")
print("Get secret value.")
value = secret.get_value()
print(f"Secret value: {value['SecretString']}")  
print("Get a random password.")
password = secret.get_random_password(20)
print(f"Got password: {password}")
print("Put password as new secret value.")
secret.put_value(password)
print("Get current and previous values.")
current = secret.get_value()
previous = secret.get_value('AWSVIOUS')
print(f"Current: {current['SecretString']}")  
print(f"Previous: {previous['SecretString']}")  
byteval = base64.b64encode("I'm a Base64 string!".encode('utf-8'))
stage = 'CUSTOM_STAGE'
print(f"Put byte value with a custom stage '{stage}'")
secret.put_value(byteval, [stage])
time.sleep(1)
print(f"Get secret value associated with stage '{stage}'")
got_val = secret.get_value(stage)
print(f"Raw bytes value: {got_val['SecretBinary']}")  
print(f"Decoded value:
{base64.b64decode(got_val['SecretBinary']).decode('utf-8')}")
pprint(secret.describe())
print("List 10 secrets for the account.")
for sec in secret.list(10):
    print(f"Name: {sec['Name']}")
print("Delete the secret.")
secret.delete(True)
```

## Cross-service examples for Secrets Manager using AWS SDKs

The following code examples show how to use AWS Secrets Manager with AWS SDKs. Each example contains a sample application that works across multiple AWS services.

### Examples

- [Create a lending library REST API \(p. 2141\)](#)

## Create a lending library REST API

The following code example shows how to create a lending library where patrons can borrow and return books by using a REST API backed by an Amazon Aurora database.

## Python

### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) with the Amazon Relational Database Service (Amazon RDS) API and AWS Chalice to create a REST API backed by an Amazon Aurora database. The web service is fully serverless and represents a simple lending library where patrons can borrow and return books. Learn how to:

- Create and manage a serverless Aurora database cluster.
- Use AWS Secrets Manager to manage database credentials.
- Implement a data storage layer that uses Amazon RDS to move data into and out of the database.
- Use AWS Chalice to deploy a serverless REST API to Amazon API Gateway and AWS Lambda.
- Use the Requests package to send requests to the web service.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- API Gateway
- Lambda
- Amazon RDS
- Secrets Manager

## Code examples for Step Functions using AWS SDKs

The following code examples show how to use AWS Step Functions with an AWS software development kit (SDK).

### Code examples

- [Actions for Step Functions using AWS SDKs \(p. 2142\)](#)
  - Create a Step Functions state machine using an AWS SDK (p. 2143)
  - Delete a Step Functions state machine using an AWS SDK (p. 2145)
  - Describe a Step Functions state machine using an AWS SDK (p. 2147)
  - List Step Functions state machine runs using an AWS SDK (p. 2147)
  - List Step Functions state machines using an AWS SDK (p. 2149)
  - Start a Step Functions state machine run using an AWS SDK (p. 2151)
  - Stop a Step Functions state machine run using an AWS SDK (p. 2154)
  - Update a Step Functions state machine using an AWS SDK (p. 2154)
- [Cross-service examples for Step Functions using AWS SDKs \(p. 2155\)](#)
  - Create a messenger application with Step Functions (p. 2155)
  - Use Step Functions to invoke Lambda functions (p. 2156)

## Actions for Step Functions using AWS SDKs

The following code examples show how to use AWS Step Functions with AWS SDKs. Each example calls an individual service function.

### Examples

- [Create a Step Functions state machine using an AWS SDK \(p. 2143\)](#)

- [Delete a Step Functions state machine using an AWS SDK \(p. 2145\)](#)
- [Describe a Step Functions state machine using an AWS SDK \(p. 2147\)](#)
- [List Step Functions state machine runs using an AWS SDK \(p. 2147\)](#)
- [List Step Functions state machines using an AWS SDK \(p. 2149\)](#)
- [Start a Step Functions state machine run using an AWS SDK \(p. 2151\)](#)
- [Stop a Step Functions state machine run using an AWS SDK \(p. 2154\)](#)
- [Update a Step Functions state machine using an AWS SDK \(p. 2154\)](#)

## Create a Step Functions state machine using an AWS SDK

## Cross-service examples for Step Functions using AWS SDKs

The following code examples show how to use AWS Step Functions with AWS SDKs. Each example contains a sample application that works across multiple AWS services.

### Examples

- [Create a messenger application with Step Functions \(p. 2155\)](#)
- [Use Step Functions to invoke Lambda functions \(p. 2156\)](#)

## Create a messenger application with Step Functions

The following code example shows how to create an AWS Step Functions messenger application that retrieves message records from a database table.

## Python

### SDK for Python (Boto3)

Shows how to use the AWS SDK for Python (Boto3) with AWS Step Functions to create a messenger application that retrieves message records from an Amazon DynamoDB table and sends them with Amazon Simple Queue Service (Amazon SQS). The state machine integrates with an AWS Lambda function to scan the database for unsent messages.

- Create a state machine that retrieves and updates message records from an Amazon DynamoDB table.
- Update the state machine definition to also send messages to Amazon Simple Queue Service (Amazon SQS).
- Start and stop state machine runs.
- Connect to Lambda, DynamoDB, and Amazon SQS from a state machine by using service integrations.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- DynamoDB
- Lambda
- Amazon SQS
- Step Functions

## Use Step Functions to invoke Lambda functions

The following code examples show how to create an AWS Step Functions state machine that invokes AWS Lambda functions in sequence.

### Java

#### SDK for Java 2.x

Shows how to create an AWS serverless workflow by using AWS Step Functions and the AWS SDK for Java 2.x. Each workflow step is implemented using an AWS Lambda function.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- DynamoDB
- Lambda
- Amazon SES
- Step Functions

### JavaScript

#### SDK for JavaScript V3

Shows how to create an AWS serverless workflow by using AWS Step Functions and the AWS SDK for JavaScript. Each workflow step is implemented using an AWS Lambda function.

Lambda is a compute service that enables you to run code without provisioning or managing servers. Step Functions is a serverless orchestration service that lets you combine Lambda functions and other AWS services to build business-critical applications.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

This example is also available in the [AWS SDK for JavaScript v3 developer guide](#).

### Services used in this example

- DynamoDB
- Lambda
- Amazon SES
- Step Functions

## Code examples for AWS Support using AWS SDKs

The following code examples show how to use AWS Support with an AWS software development kit (SDK).

### Get started

#### Hello AWS Support

The following code examples show how to get started using AWS Support.

##### .NET

###### AWS SDK for .NET

###### Note

There's more on [GitHub](#). Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using Amazon AWSSupport;
using Microsoft.Extensions.DependencyInjection;
using Microsoft.Extensions.Hosting;

public static class HelloSupport
{
    static async Task Main(string[] args)
    {
        // Use the AWS .NET Core Setup package to set up dependency injection for
        // the AWS Support service.
        // Use your AWS profile name, or leave it blank to use the default profile.
        // You must have one of the following AWS Support plans: Business,
        Enterprise On-Ramp, or Enterprise. Otherwise, an exception will be thrown.
        using var host = Host.CreateDefaultBuilder(args)
            .ConfigureServices(_ , services) =>
                services.AddAWSService<IAmazonAWSSupport>()
            .Build();

        // Now the client is available for injection.
        var supportClient = host.Services.GetRequiredService<IAmazonAWSSupport>();
```

```
// You can use await and any of the async methods to get a response.  
var response = await supportClient.DescribeServicesAsync();  
Console.WriteLine($"\\tHello AWS Support! There are  
{response.Services.Count} services available.");  
}
```

- For API details, see [DescribeServices](#) in *AWS SDK for .NET API Reference*.

## Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

## Scenarios for AWS Support using AWS SDKs

The following code examples show how to use AWS Support with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Get started with AWS Support cases using an AWS SDK \(p. 2178\)](#)

## Get started with AWS Support cases using an AWS SDK

The following code examples show how to:

- Get and display available services and severity levels for cases.
- Create a support case using a selected service, category, and severity level.
- Get and display a list of open cases for the current day.
- Add an attachment set and a communication to the new case.
- Describe the new attachment and communication for the case.
- Resolve the case.
- Get and display a list of resolved cases for the current day.

### .NET

#### AWS SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Run an interactive scenario at a command prompt.

```
/// <summary>
/// Hello AWS Support example.
/// </summary>
public static class SupportCaseScenario
{
    /*
     Before running this .NET code example, set up your development environment,
     including your credentials.
     To use the AWS Support API, you must have one of the following AWS Support
     plans: Business, Enterprise On-Ramp, or Enterprise.

    This .NET example performs the following tasks:
```

```
1. Get and display services. Select a service from the list.
2. Select a category from the selected service.
3. Get and display severity levels and select a severity level from the list.
4. Create a support case using the selected service, category, and severity
level.
5. Get and display a list of open support cases for the current day.
6. Create an attachment set with a sample text file to add to the case.
7. Add a communication with the attachment to the support case.
8. List the communications of the support case.
9. Describe the attachment set.
10. Resolve the support case.
11. Get a list of resolved cases for the current day.
*/

## Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Run various AWS Support operations.

```
/**
 * Before running this Java (v2) code example, set up your development environment,
 * including your credentials.
 *
 * For more information, see the following documentation topic:
 *
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html
 *
 * In addition, you must have the AWS Business Support Plan to use the AWS Support
 * Java API. For more information, see:
 *
 * https://aws.amazon.com/premiumsupport/plans/
 *
 * This Java example performs the following tasks:
 *
 * 1. Gets and displays available services.
 * 2. Gets and displays severity levels.
 * 3. Creates a support case by using the selected service, category, and severity
 * level.
 * 4. Gets a list of open cases for the current day.
 * 5. Creates an attachment set with a generated file.
 * 6. Adds a communication with the attachment to the support case.
 * 7. Lists the communications of the support case.
 * 8. Describes the attachment set included with the communication.
 * 9. Resolves the support case.
 * 10. Gets a list of resolved cases for the current day.

## Kotlin

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/**  
Before running this Kotlin code example, set up your development environment,  
including your credentials.  
  
For more information, see the following documentation topic:  
  
https://docs.aws.amazon.com/sdk-for-kotlin/latest/developer-guide/setup.html  
In addition, you must have the AWS Business Support Plan to use the AWS Support  
Java API. For more information, see:  
  
https://aws.amazon.com/premiumsupport/plans/  
  
This Kotlin example performs the following tasks:  
1. Gets and displays available services.  
2. Gets and displays severity levels.  
3. Creates a support case by using the selected service, category, and severity  
level.  
4. Gets a list of open cases for the current day.  
5. Creates an attachment set with a generated file.  
6. Adds a communication with the attachment to the support case.  
7. Lists the communications of the support case.  
8. Describes the attachment set included with the communication.  
9. Resolves the support case.  
10. Gets a list of resolved cases for the current day.  
*/

## Detect text in a document using Amazon Textract and an AWS SDK

The following code examples show how to detect text in a document using Amazon Textract.

Java

### SDK for Java 2.x

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Detect text from an input document.

```
public static void detectDocText(TextractClient textractClient, String sourceDoc) {  
  
    try {  
        InputStream sourceStream = new FileInputStream(new File(sourceDoc));  
        SdkBytes sourceBytes = SdkBytes.fromInputStream(sourceStream);  
  
        // Get the input Document object as bytes  
        Document myDoc = Document.builder()  
            .bytes(sourceBytes)  
            .build();  
  
        DetectDocumentTextRequest detectDocumentTextRequest =  
        DetectDocumentTextRequest.builder()  
            .document(myDoc)  
            .build();  
  
        // Invoke the Detect operation  
        DetectDocumentTextResponse textResponse =  
        textractClient.detectDocumentText(detectDocumentTextRequest);  
        List<Block> docInfo = textResponse.blocks();  
        for (Block block : docInfo) {  
            System.out.println("The block type is " +  
                block.blockType().toString());  
        }  
  
        DocumentMetadata documentMetadata = textResponse.documentMetadata();  
        System.out.println("The number of pages in the document is "

## Cross-service examples for Amazon Textract using AWS SDKs

The following code examples show how to use Amazon Textract with AWS SDKs. Each example contains a sample application that works across multiple AWS services.

### Examples

- [Create an Amazon Textract explorer application \(p. 2218\)](#)
- [Detect entities in text extracted from an image using an AWS SDK \(p. 2219\)](#)

## Create an Amazon Textract explorer application

The following code examples show how to explore Amazon Textract output through an interactive application.

JavaScript

### SDK for JavaScript V3

Shows how to use the AWS SDK for JavaScript to build a React application that uses Amazon Textract to extract data from a document image and display it in an interactive web page. This example runs in a web browser and requires an authenticated Amazon Cognito identity for credentials. It uses Amazon Simple Storage Service (Amazon S3) for storage, and for notifications it polls an Amazon Simple Queue Service (Amazon SQS) queue that is subscribed to an Amazon Simple Notification Service (Amazon SNS) topic.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon Cognito Identity
- Amazon S3
- Amazon SNS
- Amazon SQS

- Amazon Textract

Python

#### **SDK for Python (Boto3)**

Shows how to use the AWS SDK for Python (Boto3) with Amazon Textract to detect text, form, and table elements in a document image. The input image and Amazon Textract output are shown in a Tkinter application that lets you explore the detected elements.

- Submit a document image to Amazon Textract and explore the output of detected elements.
- Submit images directly to Amazon Textract or through an Amazon Simple Storage Service (Amazon S3) bucket.
- Use asynchronous APIs to start a job that publishes a notification to an Amazon Simple Notification Service (Amazon SNS) topic when the job completes.
- Poll an Amazon Simple Queue Service (Amazon SQS) queue for a job completion message and display the results.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### **Services used in this example**

- Amazon S3
- Amazon SNS
- Amazon SQS
- Amazon Textract

## Detect entities in text extracted from an image using an AWS SDK

The following code example shows how to use Amazon Comprehend to detect entities in text extracted by Amazon Textract from an image that is stored in Amazon S3.

Python

#### **SDK for Python (Boto3)**

Shows how to use the AWS SDK for Python (Boto3) in a Jupyter notebook to detect entities in text that is extracted from an image. This example uses Amazon Textract to extract text from an image stored in Amazon Simple Storage Service (Amazon S3) and Amazon Comprehend to detect entities in the extracted text.

This example is a Jupyter notebook and must be run in an environment that can host notebooks. For instructions on how to run the example using Amazon SageMaker, see the directions in [TextractAndComprehendNotebook.ipynb](#).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### **Services used in this example**

- Amazon Comprehend
- Amazon S3
- Amazon Textract

# Code examples for Amazon Transcribe using AWS SDKs

The following code examples show how to use Amazon Transcribe with an AWS software development kit (SDK).

## Code examples

- [Actions for Amazon Transcribe using AWS SDKs \(p. 2220\)](#)
  - [Create a custom Amazon Transcribe vocabulary using an AWS SDK \(p. 2221\)](#)
  - [Delete a custom Amazon Transcribe vocabulary using an AWS SDK \(p. 2222\)](#)
  - [Delete a Amazon Transcribe Medical transcription job using an AWS SDK \(p. 2223\)](#)
  - [Delete an Amazon Transcribe transcription job using an AWS SDK \(p. 2224\)](#)
  - [Get a custom Amazon Transcribe vocabulary using an AWS SDK \(p. 2226\)](#)
  - [Get an Amazon Transcribe transcription job using an AWS SDK \(p. 2227\)](#)
  - [List custom Amazon Transcribe vocabularies using an AWS SDK \(p. 2228\)](#)
  - [List Amazon Transcribe Medical transcription jobs using an AWS SDK \(p. 2229\)](#)
  - [List Amazon Transcribe transcription jobs using an AWS SDK \(p. 2231\)](#)
  - [Produce real-time transcriptions with Amazon Transcribe using an AWS SDK \(p. 2233\)](#)
  - [Start an Amazon Transcribe Medical transcription job using an AWS SDK \(p. 2236\)](#)

## Scenarios for Amazon Transcribe using AWS SDKs

The following code examples show how to use Amazon Transcribe with AWS SDKs. Each example shows you how to accomplish a specific task by calling multiple functions within the same service.

### Examples

- [Create and refine an Amazon Transcribe custom vocabulary using an AWS SDK \(p. 2242\)](#)
- [Transcribe audio and get job data with Amazon Transcribe using an AWS SDK \(p. 2247\)](#)

## Create and refine an Amazon Transcribe custom vocabulary using an AWS SDK

The following code example shows how to:

- Upload an audio file to Amazon S3.
- Run an Amazon Transcribe job to transcribe the file and get the results.
- Create and refine a custom vocabulary to improve transcription accuracy.
- Run jobs with custom vocabularies and get the results.

Python

### SDK for Python (Boto3)

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Transcribe an audio file that contains a reading of Jabberwocky by Lewis Carroll. Start by creating functions that wrap Amazon Transcribe actions.

```
def start_job(
    job_name, media_uri, media_format, language_code, transcribe_client,
    vocabulary_name=None):
    """
    Starts a transcription job. This function returns as soon as the job is
    started.
    To get the current status of the job, call get_transcription_job. The job is
    successfully completed when the job status is 'COMPLETED'.

    :param job_name: The name of the transcription job. This must be unique for
        your AWS account.
    :param media_uri: The URI where the audio file is stored. This is typically
        in an Amazon S3 bucket.
    :param media_format: The format of the audio file. For example, mp3 or wav.
    :param language_code: The language code of the audio file.
        For example, en-US or ja-JP
    :param transcribe_client: The Boto3 Transcribe client.
    :param vocabulary_name: The name of a custom vocabulary to use when
        transcribing
        the audio file.
    :return: Data about the job.
    """
    try:
        job_args = {
            'TranscriptionJobName': job_name,
            'Media': {'MediaFileUri': media_uri},
            'MediaFormat': media_format,
            'LanguageCode': language_code}
        if vocabulary_name is not None:

## Cross-service examples for Amazon Transcribe using AWS SDKs

The following code examples show how to use Amazon Transcribe with AWS SDKs. Each example contains a sample application that works across multiple AWS services.

### Examples

- [Build an Amazon Transcribe app \(p. 2248\)](#)
- [Build an Amazon Transcribe streaming app \(p. 2249\)](#)
- [Convert text to speech and back to text using an AWS SDK \(p. 2249\)](#)

## Build an Amazon Transcribe app

The following code example shows how to use Amazon Transcribe to transcribe and display voice recordings in the browser.

JavaScript

### SDK for JavaScript V3

Create an app that uses Amazon Transcribe to transcribe and display voice recordings in the browser. The app uses two Amazon Simple Storage Service (Amazon S3) buckets, one to host the application code, and another to store transcriptions. The app uses an Amazon Cognito user pool to authenticate your users. Authenticated users have AWS Identity and Access Management (IAM) permissions to access the required AWS services.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

This example is also available in the [AWS SDK for JavaScript v3 developer guide](#).

#### Services used in this example

- Amazon Cognito Identity
- Amazon S3
- Amazon Transcribe

## Build an Amazon Transcribe streaming app

The following code example shows how to build an app that records, transcribes, and translates live audio in real-time, and emails the results.

JavaScript

### SDK for JavaScript V3

Shows how to use Amazon Transcribe to build an app that records, transcribes, and translates live audio in real-time, and emails the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Comprehend
- Amazon SES
- Amazon Transcribe
- Amazon Translate

## Convert text to speech and back to text using an AWS SDK

The following code example shows how to:

- Use Amazon Polly to synthesize a plain text (UTF-8) input file to an audio file.
- Upload the audio file to an Amazon Simple Storage Service (Amazon S3) bucket.
- Use Amazon Transcribe to convert the audio file to text.
- Display the text.

Rust

### SDK for Rust

#### Note

This documentation is for an SDK in preview release. The SDK is subject to change and should not be used in production.

Use Amazon Polly to synthesize a plain text (UTF-8) input file to an audio file, upload the audio file to an Amazon Simple Storage Service bucket, use Amazon Transcribe to convert that audio file to text, and display the text.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Polly
- Amazon S3
- Amazon Transcribe

## Code examples for Amazon Translate using AWS SDKs

The following code examples show how to use Amazon Translate with an AWS software development kit (SDK).

## Cross-service examples for Amazon Translate using AWS SDKs

The following code examples show how to use Amazon Translate with AWS SDKs. Each example contains a sample application that works across multiple AWS services.

### Examples

- [Build an Amazon Transcribe streaming app \(p. 2263\)](#)
- [Create an Amazon Lex Chatbot within a web application to engage your web site visitors \(p. 2264\)](#)
- [Build a publish and subscription application that translates messages \(p. 2265\)](#)

## Build an Amazon Transcribe streaming app

The following code example shows how to build an app that records, transcribes, and translates live audio in real-time, and emails the results.

JavaScript

### SDK for JavaScript V3

Shows how to use Amazon Transcribe to build an app that records, transcribes, and translates live audio in real-time, and emails the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Comprehend
- Amazon SES
- Amazon Transcribe
- Amazon Translate

## Create an Amazon Lex Chatbot within a web application to engage your web site visitors

The following code examples show how to create a Chatbot to engage your web site visitors.

Java

### SDK for Java 2.x

Shows how to use the Amazon Lex API to create a Chatbot within a web application to engage your web site visitors.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Comprehend
- Amazon Lex
- Amazon Translate

JavaScript

### SDK for JavaScript V3

Shows how to use the Amazon Lex API to create a Chatbot within a web application to engage your web site visitors.

For complete source code and instructions on how to set up and run, see the full example [Building an Amazon Lex chatbot](#) in the AWS SDK for JavaScript developer guide.

#### Services used in this example

- Amazon Comprehend
- Amazon Lex
- Amazon Translate

## Build a publish and subscription application that translates messages

The following code examples show how to create an application that has subscription and publish functionality and translates messages.

.NET

### AWS SDK for .NET

Shows how to use the Amazon Simple Notification Service .NET API to create a web application that has subscription and publish functionality. In addition, this example application also translates messages.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon SNS
- Amazon Translate

Java

### SDK for Java 2.x

Shows how to use the Amazon Simple Notification Service Java API to create a web application that has subscription and publish functionality. In addition, this example application also translates messages.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

For complete source code and instructions on how to set up and run the example that uses the Java Async API, see the full example on [GitHub](#).

#### Services used in this example

- Amazon SNS
- Amazon Translate

Kotlin

### SDK for Kotlin

#### Note

This is prerelease documentation for a feature in preview release. It is subject to change.

Shows how to use the Amazon SNS Kotlin API to create an application that has subscription and publish functionality. In addition, this example application also translates messages.

For complete source code and instructions on how to create a web app, see the full example on [GitHub](#).

For complete source code and instructions on how to create a native Android app, see the full example on [GitHub](#).

**Services used in this example**

- Amazon SNS
- Amazon Translate

# Code examples by SDK using AWS SDKs

The following code examples show how to use AWS services with an AWS software development kit (SDK).

## Code examples

- [Code examples for AWS SDK for .NET \(p. 2267\)](#)
- [Code examples for SDK for C++ \(p. 2608\)](#)
- [Code examples for SDK for Go V2 \(p. 2715\)](#)
- [Code examples for SDK for JavaScript V2 \(p. 2801\)](#)
- [Code examples for SDK for JavaScript V3 \(p. 2909\)](#)
- [Code examples for SDK for Java 2.x \(p. 3156\)](#)
- [Code examples for SDK for Kotlin \(p. 3499\)](#)
- [Code examples for SDK for PHP \(p. 3665\)](#)

- [Code examples for SDK for Ruby \(p. 4310\)](#)
- [Code examples for SDK for Rust \(p. 4391\)](#)
- [Code examples for SDK for SAP ABAP \(p. 4482\)](#)
- [Code examples for SDK for Swift \(p. 4557\)](#)

## Code examples for AWS SDK for .NET

The code examples in this topic show you how to use the AWS SDK for .NET with AWS.

### Examples

- [Single-service actions and scenarios using AWS SDK for .NET \(p. 2267\)](#)
- [Cross-service examples using AWS SDK for .NET \(p. 2606\)](#)

## Single-service actions and scenarios using AWS SDK for .NET

The following code examples show how to perform actions and implement common scenarios by using the AWS SDK for .NET with AWS services.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Services

## Actions

### Describe a certificate

The following code example shows how to describe ACM certificates.

## AWS SDK for .NET

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using Amazon;
using Amazon.CertificateManager;
using Amazon.CertificateManager.Model;
using System;
using System.Threading.Tasks;

namespace DescribeCertificate
{
    class DescribeCertificate
    {
        // The following example retrieves and displays the metadata for a
        // certificate using the AWS Certificate Manager (ACM) service. It
        // was created using AWS SDK for .NET 3.5 and .NET 5.0.

        // Specify your AWS Region (an example Region is shown).
        private static readonly RegionEndpoint ACMRegion = RegionEndpoint.USEast1;
        private static AmazonCertificateManagerClient _client;

        static void Main(string[] args)
        {
            var _client = new
                Amazon.CertificateManager.AmazonCertificateManagerClient(ACMRegion);

            var describeCertificateReq = new DescribeCertificateRequest();
            // The ARN used here is just an example. Replace it with the ARN of
            // a certificate that exists on your account.
            describeCertificateReq.CertificateArn =
                "arn:aws:acm:us-
east-1:123456789012:certificate/8cf7daa-9b6a-2d07-92bc-1c309EXAMPLE";

            var certificateDetailResp =
                DescribeCertificateResponseAsync(client: _client, request:
describeCertificateReq);
            var certificateDetail = certificateDetailResp.Result.Certificate;

            if (certificateDetail is not null)
            {
                DisplayCertificateDetails(certificateDetail);
            }
        }

        ///<summary>
        /// Displays detailed metadata about a certificate retrieved
        /// using the ACM service.
        ///</summary>
        ///<param name="certificateDetail">The object that contains details
        /// returned from the call to DescribeCertificateAsync.</param>

## Describe alarm history

The following code example shows how to describe Amazon CloudWatch alarm history.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Get a list of CloudWatch alarms, then retrieve the history for each alarm.

```
using System;  
using System.Threading.Tasks;  
using Amazon.CloudWatch;  
using Amazon.CloudWatch.Model;  
  
    /// <summary>  
    /// This example retrieves a list of Amazon CloudWatch alarms and, for  
    /// each one, displays its history. The example was created using the  
    /// AWS SDK for .NET 3.7 and .NET Core 5.0.  
    /// </summary>  
public class DescribeAlarmHistories  
{  
    /// <summary>  
    /// Retrieves a list of alarms and then passes each name to the  
    /// DescribeAlarmHistoriesAsync method to retrieve its history.  
    /// </summary>  
    public static async Task Main()  
    {  
        IAmazonCloudWatch cwClient = new AmazonCloudWatchClient();  
        var response = await cwClient.DescribeAlarmsAsync();  
  
        foreach (var alarm in response.MetricAlarms)  
        {  
            await DescribeAlarmHistoriesAsync(cwClient, alarm.AlarmName);  
        }  
    }  
  
    /// <summary>  
    /// Retrieves the CloudWatch alarm history for the alarm name passed  
    /// to the method.  
    /// </summary>
```

```
    ///<param name="client">An initialized CloudWatch client object.</param>
    ///<param name="alarmName">The CloudWatch alarm for which to retrieve
    /// history information.</param>
    public static async Task DescribeAlarmHistoriesAsync(IAmazonCloudWatch client,
string alarmName)
{
    var request = new DescribeAlarmHistoryRequest
    {
        AlarmName = alarmName,
        EndDateUtc = DateTime.Today,
        HistoryItemType = HistoryItemType.Action,
        MaxRecords = 1,
        StartDateUtc = DateTime.Today.Subtract(TimeSpan.FromDays(30)),
    };

    var response = new DescribeAlarmHistoryResponse();

    do
    {
        response = await client.DescribeAlarmHistoryAsync(request);

        foreach (var item in response.AlarmHistoryItems)
        {
            Console.WriteLine(item.AlarmName);
            Console.WriteLine(item.HistorySummary);
            Console.WriteLine();
        }

        request.NextToken = response.NextToken;
    }
    while (!string.IsNullOrEmpty(response.NextToken));
}
}
```

## Actions

### Associate a key with a log group

The following code example shows how to associate an AWS KMS key with an existing CloudWatch Logs log group.

#### AWS SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.Threading.Tasks;
using Amazon.CloudWatchLogs;
using Amazon.CloudWatchLogs.Model;

/// <summary>
/// Shows how to associate an AWS Key Management Service (AWS KMS) key with
/// an Amazon CloudWatch Logs log group. The example was created using the
/// AWS SDK for .NET version 3.7 and .NET Core 5.0.
/// </summary>
public class AssociateKmsKey
```

```
{  
    public static async Task Main()  
    {  
        // This client object will be associated with the same AWS Region  
        // as the default user on this system. If you need to use a  
        // different AWS Region, pass it as a parameter to the client  
        // constructor.  
        var client = new AmazonCloudWatchLogsClient();  
  
        string kmsKeyId = "arn:aws:kms:us-west-2:<account-  
number>:key/7c9ecc2-38cb-4c4f-9db3-766ee8dd3ad4";  
        string groupName = "cloudwatchlogs-example-loggroup";  
  
        var request = new AssociateKmsKeyRequest  
        {  
            KmsKeyId = kmsKeyId,  
            LogGroupName = groupName,  
        };  
  
        var response = await client.AssociateKmsKeyAsync(request);  
  
        if (response.HttpStatusCode == System.Net.HttpStatusCode.OK)  
        {  
            Console.WriteLine($"Successfully associated KMS key ID: {kmsKeyId} with  
log group: {groupName}.");  
        }  
        else  
        {  
            Console.WriteLine("Could not make the association between: {kmsKeyId}  
and {groupName}.");  
        }  
    }  
}
```

- For API details, see [AssociateKmsKey](#) in *AWS SDK for .NET API Reference*.

## Cancel an export task

## Verify an MFA application with a user

The following code example shows how to verify an MFA application with an Amazon Cognito user.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
    /// <summary>
    /// Verifies that the user has supplied the correct one-time password
    /// and registers for multi-factor authentication (MFA).
    /// </summary>
    /// <param name="identityProviderClient">The Amazon Cognito client object.</
param>
    /// <param name="session">The session for which the user will be
    /// authenticated.</param>
    /// <param name="code">The code provided by the user.</param>
    /// <returns>A Boolean value that indicates the success of the
    /// authentication.</returns>
    public static async Task<bool> VerifyTOTP(
```

```
        AmazonCognitoIdentityProviderClient identityProviderClient,
        string session,
        string code)
    {
        var tokenRequest = new VerifySoftwareTokenRequest
        {
            UserCode = code,
            Session = session,
        };

        var response = await
identityProviderClient.VerifySoftwareTokenAsync(tokenRequest);

        Console.WriteLine($"The status of the token is {response.Status}");

        return response.Status == VerifySoftwareTokenResponseType.SUCCESS;
    }
}
```

- For API details, see [VerifySoftwareToken](#) in *AWS SDK for .NET API Reference*.

## Scenarios

### Sign up a user with a user pool that requires MFA

The following code example shows how to:

- Sign up a user with a user name, password, and email address.
- Confirm the user from a code sent in email.
- Set up multi-factor authentication by associating an MFA application with the user.
- Sign in by using a password and an MFA code.

#### AWS SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
global using Amazon;
global using Amazon.CognitoIdentityProvider;
global using Amazon.CognitoIdentityProvider.Model;
global using Cognito_MVP;

// Before running this AWS SDK for .NET (v3) code example, set up your development
// environment, including your credentials.
// For more information, see the following documentation:
// https://docs.aws.amazon.com/sdk-for-net/v3/developer-guide/net-dg-setup.html
// TIP: To set up the required user pool, run the AWS Cloud Development Kit (AWS CDK)
// script provided in this GitHub repo at:
// resources/cdk/cognito_scenario_user_pool_with_mfa.
// This code example performs the following operations:
// 1. Invokes the signUp method to sign up a user.
// 2. Invokes the adminGetUser method to get the user's confirmation status.
// 3. Invokes the ResendConfirmationCode method if the user requested another code.
// 4. Invokes the confirmSignUp method.
// 5. Invokes the initiateAuth to sign in. This results in being prompted to set up
// TOTP (time-based one-time password). (The response is "ChallengeName": "MFA_SETUP").
```

```
// 6. Invokes the AssociateSoftwareToken method to generate a TOTP MFA private key.  
// This can be used with Google Authenticator.  
// 7. Invokes the VerifySoftwareToken method to verify the TOTP and register for MFA.  
// 8. Invokes the AdminInitiateAuth to sign in again. This results in being prompted to  
// submit a TOTP (Response: "ChallengeName": "SOFTWARE_TOKEN_MFA").  
// 9. Invokes the AdminRespondToAuthChallenge to get back a token.  
  
// Set the following variables:

## DynamoDB examples using AWS SDK for .NET

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for .NET with Amazon DynamoDB.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2305\)](#)
- [Scenarios \(p. 2320\)](#)

## Actions

### Create a table

The following code example shows how to create a DynamoDB table.

#### AWS SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
///<summary>
/// Creates a new Amazon DynamoDB table and then waits for the new
/// table to become active.
///</summary>
///<param name="client">An initialized Amazon DynamoDB client object.</param>
///<param name="tableName">The name of the table to create.</param>
///<returns>A Boolean value indicating the success of the operation.</returns>
public static async Task<bool> CreateMovieTableAsync(AmazonDynamoDBClient
client, string tableName)
{
    var response = await client.CreateTableAsync(new CreateTableRequest
    {
        TableName = tableName,
        AttributeDefinitions = new List<AttributeDefinition>()
        {
            new AttributeDefinition
            {
                AttributeName = "title",
                AttributeType = "S",
            },
            new AttributeDefinition
            {
                AttributeName = "year",
                AttributeType = "N",
            },
        },
        KeySchema = new List<KeySchemaElement>()
        {
            new KeySchemaElement
            {
                AttributeName = "year",
                KeyType = "HASH",
            }
        }
    });
    return response.TableStatus == CreateTableResponse.TableStatus.SUCCEEDED;
}
```

```
        },
        new KeySchemaElement
        {
            AttributeName = "title",
            KeyType = "RANGE",
        },
    },
    ProvisionedThroughput = new ProvisionedThroughput
    {
        ReadCapacityUnits = 5,
        WriteCapacityUnits = 5,
    },
);

// Wait until the table is ACTIVE and then report success.
Console.WriteLine("Waiting for table to become active...");

var request = new DescribeTableRequest
{
    TableName = response.TableDescription.TableName,
};

TableStatus status;

int sleepDuration = 2000;

do
{
    System.Threading.Thread.Sleep(sleepDuration);

    var describeTableResponse = await client.DescribeTableAsync(request);
    status = describeTableResponse.Table.TableStatus;

    Console.WriteLine(".");
}
while (status != "ACTIVE");

return status == TableStatus.ACTIVE;
}
```

- For API details, see [CreateTable](#) in *AWS SDK for .NET API Reference*.

## Delete a table

The following code example shows how to delete a DynamoDB table.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static async Task<bool> DeleteTableAsync(AmazonDynamoDBClient client,
string tableName)
{
    var request = new DeleteTableRequest
    {
        TableName = tableName,
    };
}
```

```
        var response = await client.DeleteTableAsync(request);
        if (response.HttpStatusCode == System.Net.HttpStatusCode.OK)
        {
            Console.WriteLine($"Table {response.TableDescription.TableName}
successfully deleted.");
            return true;
        }
        else
        {
            Console.WriteLine("Could not delete table.");
            return false;
        }
    }
```

- For API details, see [DeleteTable](#) in *AWS SDK for .NET API Reference*.

## Delete an item from a table

The following code example shows how to delete an item from a DynamoDB table.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Deletes a single item from a DynamoDB table.
/// </summary>
/// <param name="client">The initialized DynamoDB client object.</param>
/// <param name="tableName">The name of the table from which the item
/// will be deleted.</param>
/// <param name="movieToDelete">A movie object containing the title and
/// year of the movie to delete.</param>
/// <returns>A Boolean value indicating the success or failure of the
/// delete operation.</returns>
public static async Task<bool> DeleteItemAsync(
    AmazonDynamoDBClient client,
    string tableName,
    Movie movieToDelete)
{
    var key = new Dictionary<string, AttributeValue>
    {
        ["title"] = new AttributeValue { S = movieToDelete.Title },
        ["year"] = new AttributeValue { N = movieToDelete.Year.ToString() },
    };

    var request = new DeleteItemRequest
    {
        TableName = tableName,
        Key = key,
    };

    var response = await client.DeleteItemAsync(request);
    return response.HttpStatusCode == System.Net.HttpStatusCode.OK;
}
```

- For API details, see [DeleteItem](#) in *AWS SDK for .NET API Reference*.

## Get a batch of items

The following code example shows how to get a batch of DynamoDB items.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Gets information about an existing movie from the table.
/// </summary>
/// <param name="client">An initialized Amazon DynamoDB client object.</param>
/// <param name="newMovie">A Movie object containing information about
/// the movie to retrieve.</param>
/// <param name="tableName">The name of the table containing the movie.</param>
/// <returns>A Dictionary object containing information about the item
/// retrieved.</returns>
public static async Task<Dictionary<string, AttributeValue>>
GetItemAsync(AmazonDynamoDBClient client, Movie newMovie, string tableName)
{
    var key = new Dictionary<string, AttributeValue>
    {
        ["title"] = new AttributeValue { S = newMovie.Title },
        ["year"] = new AttributeValue { N = newMovie.Year.ToString() },
    };

    var request = new GetItemRequest
    {
        Key = key,
        TableName = tableName,
    };

    var response = await client.GetItemAsync(request);
    return response.Item;
}
```

- For API details, see [BatchGetItem](#) in *AWS SDK for .NET API Reference*.

## Put an item in a table

The following code example shows how to put an item in a DynamoDB table.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Adds a new item to the table.
/// </summary>
```

```
    ///<param name="client">An initialized Amazon DynamoDB client object.</param>
    ///<param name="newMovie">A Movie object containing information for
    ///the movie to add to the table.</param>
    ///<param name="tableName">The name of the table where the item will be
    added.</param>
    ///<returns>A Boolean value that indicates the results of adding the item.</returns>
    public static async Task<bool> PutItemAsync(AmazonDynamoDBClient client, Movie
    newMovie, string tableName)
    {
        var item = new Dictionary<string, AttributeValue>
        {
            ["title"] = new AttributeValue { S = newMovie.Title },
            ["year"] = new AttributeValue { N = newMovie.Year.ToString() },
        };

        var request = new PutItemRequest
        {
            TableName = tableName,
            Item = item,
        };

        var response = await client.PutItemAsync(request);
        return response.HttpStatusCode == System.Net HttpStatusCode.OK;
    }
```

- For API details, see [PutItem](#) in *AWS SDK for .NET API Reference*.

## Query a table

The following code example shows how to query a DynamoDB table.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
    ///<summary>
    /// Queries the table for movies released in a particular year and
    /// then displays the information for the movies returned.
    ///</summary>
    ///<param name="client">The initialized DynamoDB client object.</param>
    ///<param name="tableName">The name of the table to query.</param>
    ///<param name="year">The release year for which we want to
    ///view movies.</param>
    ///<returns>The number of movies that match the query.</returns>
    public static async Task<int> QueryMoviesAsync(AmazonDynamoDBClient client,
    string tableName, int year)
    {
        var movieTable = Table.LoadTable(client, tableName);
        var filter = new QueryFilter("year", QueryOperator.Equal, year);

        Console.WriteLine("\nFind movies released in: {year}:");

        var config = new QueryOperationConfig()
        {
            Limit = 10, // 10 items per page.
            Select = SelectValues.SpecificAttributes,
```

```
        AttributesToGet = new List<string>
    {
        "title",
        "year",
    },
    ConsistentRead = true,
    Filter = filter,
};

// Value used to track how many movies match the
// supplied criteria.
var moviesFound = 0;

Search search = movieTable.Query(config);
do
{
    var movieList = await search.GetNextSetAsync();
    moviesFound += movieList.Count;

    foreach (var movie in movieList)
    {
        DisplayDocument(movie);
    }
}
while (!search.IsDone);

return moviesFound;
}
```

- For API details, see [Query in AWS SDK for .NET API Reference](#).

## Run a PartiQL statement

The following code example shows how to run a PartiQL statement on a DynamoDB table.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Use an INSERT statement to add an item.

```
/// <summary>
/// Inserts a single movie into the movies table.
/// </summary>
/// <param name="tableName">The name of the table.</param>
/// <param name="movieTitle">The title of the movie to insert.</param>
/// <param name="year">The year that the movie was released.</param>
/// <returns>A Boolean value that indicates the success or failure of
/// the INSERT operation.</returns>
public static async Task<bool> InsertSingleMovie(string tableName, string
movieTitle, int year)
{
    string insertBatch = $"INSERT INTO {tableName} VALUE {{'title': ?, 'year': ?}}";
    var response = await Client.ExecuteStatementAsync(new
ExecuteStatementRequest
{
```

```
        Statement = insertBatch,
        Parameters = new List<AttributeValue>
        {
            new AttributeValue { S = movieTitle },
            new AttributeValue { N = year.ToString() },
        },
    });

    return response.StatusCode == System.Net.HttpStatusCode.OK;
}
```

Use a SELECT statement to get an item.

```
/// <summary>
/// Uses a PartiQL SELECT statement to retrieve a single movie from the
/// movie database.
/// </summary>
/// <param name="tableName">The name of the movie table.</param>
/// <param name="movieTitle">The title of the movie to retrieve.</param>
/// <returns>A list of movie data. If no movie matches the supplied
/// title, the list is empty.</returns>
public static async Task<List<Dictionary<string, AttributeValue>>>
GetSingleMovie(string tableName, string movieTitle)
{
    string selectSingle = $"SELECT * FROM {tableName} WHERE title = ?";
    var parameters = new List<AttributeValue>
    {
        new AttributeValue { S = movieTitle },
    };

    var response = await Client.ExecuteStatementAsync(new
ExecuteStatementRequest
{
    Statement = selectSingle,
    Parameters = parameters,
});

    return response.Items;
}
```

Use a SELECT statement to get a list of items.

```
/// <summary>
/// Retrieve multiple movies by year using a SELECT statement.
/// </summary>
/// <param name="tableName">The name of the movie table.</param>
/// <param name="year">The year the movies were released.</param>
/// <returns></returns>
public static async Task<List<Dictionary<string, AttributeValue>>>
GetMovies(string tableName, int year)
{
    string selectSingle = $"SELECT * FROM {tableName} WHERE year = ?";
    var parameters = new List<AttributeValue>
    {
        new AttributeValue { N = year.ToString() },
    };
}
```

```
        var response = await Client.ExecuteStatementAsync(new
ExecuteStatementRequest
{
    Statement = selectSingle,
    Parameters = parameters,
});

return response.Items;
}
```

Use an UPDATE statement to update an item.

```
/// <summary>
/// Updates a single movie in the table, adding information for the
/// producer.
/// </summary>
/// <param name="tableName">the name of the table.</param>
/// <param name="producer">The name of the producer.</param>
/// <param name="movieTitle">The movie title.</param>
/// <param name="year">The year the movie was released.</param>
/// <returns>A Boolean value that indicates the success of the
/// UPDATE operation.</returns>
public static async Task<bool> UpdateSingleMovie(string tableName, string
producer, string movieTitle, int year)
{
    string insertSingle = $"UPDATE {tableName} SET Producer=? WHERE title = ?
AND year = ?";

    var response = await Client.ExecuteStatementAsync(new
ExecuteStatementRequest
{
    Statement = insertSingle,
    Parameters = new List<AttributeValue>
    {
        new AttributeValue { S = producer },
        new AttributeValue { S = movieTitle },
        new AttributeValue { N = year.ToString() },
    },
});
    return response.StatusCode == System.Net.HttpStatusCode.OK;
}
```

Use a DELETE statement to delete a single movie.

```
/// <summary>
/// Deletes a single movie from the table.
/// </summary>
/// <param name="tableName">The name of the table.</param>
/// <param name="movieTitle">The title of the movie to delete.</param>
/// <param name="year">The year that the movie was released.</param>
/// <returns>A Boolean value that indicates the success of the
/// DELETE operation.</returns>
public static async Task<bool> DeleteSingleMovie(string tableName, string
movieTitle, int year)
{
    var deleteSingle = $"DELETE FROM {tableName} WHERE title = ? AND year = ?";
```

```
        var response = await Client.ExecuteStatementAsync(new
ExecuteStatementRequest
{
    Statement = deleteSingle,
    Parameters = new List<AttributeValue>
    {
        new AttributeValue { S = movieTitle },
        new AttributeValue { N = year.ToString() },
    },
});
return response.HttpStatusCode == System.Net.HttpStatusCode.OK;
}
```

- For API details, see [ExecuteStatement](#) in *AWS SDK for .NET API Reference*.

## Run batches of PartiQL statements

The following code example shows how to run batches of PartiQL statements on a DynamoDB table.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Use batches of INSERT statements to add items.

```
///<summary>
///
///</summary>
///<param name="tableName"></param>
///<param name="title1"></param>
///<param name="title2"></param>
///<param name="year1"></param>
///<param name="year2"></param>
///<returns></returns>
public static async Task<bool> GetBatch(
    string tableName,
    string title1,
    string title2,
    int year1,
    int year2)
{
    var getBatch = $"SELECT FROM {tableName} WHERE title = ? AND year = ?";
    var statements = new List<BatchStatementRequest>
    {
        new BatchStatementRequest
        {
            Statement = getBatch,
            Parameters = new List<AttributeValue>
            {
                new AttributeValue { S = title1 },
                new AttributeValue { N = year1.ToString() },
            },
            new BatchStatementRequest
            {
                Statement = getBatch,
                Parameters = new List<AttributeValue>
                {
                    new AttributeValue { S = title2 },
                    new AttributeValue { N = year2.ToString() },
                },
            }
        }
    };
    return await Client.BatchWriteItemAsync(tableName, statements);
}
```

```
    Parameters = new List<AttributeValue>
    {
        new AttributeValue { S = title2 },
        new AttributeValue { N = year2.ToString() },
    },
};

var response = await Client.BatchExecuteStatementAsync(new
BatchExecuteStatementRequest
{
    Statements = statements,
});

if (response.Responses.Count > 0)
{
    response.Responses.ForEach(r =>
    {
        Console.WriteLine($"{r.Item["title"]}\t{r.Item["year"]}");
    });
    return true;
}
else
{
    Console.WriteLine($"Couldn't find either {title1} or {title2}.");
    return false;
}

}
```

Use batches of SELECT statements to get items.

```
/// <summary>
/// Inserts movies imported from a JSON file into the movie table by
/// using an Amazon DynamoDB PartiQL INSERT statement.

## Scan a table

The following code example shows how to scan a DynamoDB table.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static async Task<int> ScanTableAsync(
    AmazonDynamoDBClient client,
    string tableName,
    int startYear,
    int endYear)
{
    var request = new ScanRequest
    {
        TableName = tableName,
        ExpressionAttributeNames = new Dictionary<string, string>
        {
            { "#yr", "year" },
        },
        ExpressionAttributeValues = new Dictionary<string, AttributeValue>
        {
            { ":y_a", new AttributeValue { N = startYear.ToString() } },
            { ":y_z", new AttributeValue { N = endYear.ToString() } },
        },
        FilterExpression = "#yr between :y_a and :y_z",
        ProjectionExpression = "#yr, title, info.actors[0], info.directors,
info.running_time_secs",
    };

    // Keep track of how many movies were found.
    int foundCount = 0;

    var response = new ScanResponse();
    do
    {
        response = await client.ScanAsync(request);
        foundCount += response.Items.Count;
        response.Items.ForEach(i => DisplayItem(i));
    }
    while (response.LastEvaluatedKey.Count > 1);
    return foundCount;
}
```

## Write a batch of items

The following code example shows how to write a batch of DynamoDB items.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Writes a batch of items to the movie table.

```
/// <summary>
/// Loads the contents of a JSON file into a list of movies to be
/// added to the DynamoDB table.
/// </summary>
/// <param name="movieFileName">The full path to the JSON file.</param>
/// <returns>A generic list of movie objects.</returns>
public static List<Movie> ImportMovies(string movieFileName)
{
    if (!File.Exists(movieFileName))
    {
        return null;
    }

    using var sr = new StreamReader(movieFileName);
    string json = sr.ReadToEnd();
    var allMovies = JsonConvert.DeserializeObject<List<Movie>>(json);

    // Now return the first 250 entries.
    return allMovies.GetRange(0, 250);
}

/// <summary>
/// Writes 250 items to the movie table.
/// </summary>
/// <param name="client">The initialized DynamoDB client object.</param>
/// <param name="movieFileName">A string containing the full path to
/// the JSON file containing movie data.</param>
/// <returns>A long integer value representing the number of movies
/// imported from the JSON file.</returns>
public static async Task<long> BatchWriteItemsAsync(
    AmazonDynamoDBClient client,
    string movieFileName)
{
    var movies = ImportMovies(movieFileName);
    if (movies is null)
    {
        Console.WriteLine("Couldn't find the JSON file with movie data.");
        return 0;
    }

    var context = new DynamoDBContext(client);

    var bookBatch = context.CreateBatchWrite<Movie>();
    bookBatch.AddPutItems(movies);

    Console.WriteLine("Adding imported movies to the table.");
    await bookBatch.ExecuteAsync();

    return movies.Count;
}
```

- For API details, see [BatchWriteItem in AWS SDK for .NET API Reference](#).

## Scenarios

### Get started using tables, items, and queries

The following code example shows how to:

- Create a table that can hold movie data.
- Put, get, and update a single movie in the table.
- Write movie data to the table from a sample JSON file.
- Query for movies that were released in a given year.
- Scan for movies that were released in a range of years.
- Delete a movie from the table.
- Delete the table.

## AWS SDK for .NET

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// This example application performs the following basic Amazon DynamoDB
// functions:
//
// CreateTableAsync
// PutItemAsync
// UpdateItemAsync
// BatchWriteItemAsync
// GetItemAsync
// DeleteItemAsync
// Query
// Scan
// DeleteItemAsync
//
// The code in this example uses the AWS SDK for .NET version 3.7 and .NET 5.
// Before you run this example, download 'movies.json' from
// https://github.com/awsdocs/aws-doc-sdk-examples/tree/main/resources/sample_files,
// and put it in the same folder as the example.

### Query a table by using batches of PartiQL statements

The following code example shows how to:

- Get a batch of items by running multiple SELECT statements.
- Add a batch of items by running multiple INSERT statements.
- Update a batch of items by running multiple UPDATE statements.
- Delete a batch of items by running multiple DELETE statements.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Before you run this example, download 'movies.json' from
// https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/
GettingStarted.Js.02.html,
// and put it in the same folder as the example.

## Amazon EC2 examples using AWS SDK for .NET

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for .NET with Amazon Elastic Compute Cloud.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2344\)](#)

## Actions

### Create a VPC

The following code example shows how to create an Amazon EC2 VPC.

## AWS SDK for .NET

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.Threading.Tasks;
using Amazon.EC2;
using Amazon.EC2.Model;

/// <summary>
/// Shows how to create an Amazon Elastic Compute Cloud (Amazon EC2) VPC
/// using the AWS SDK for .NET and .NET Core 5.0.
/// </summary>
public class CreateVPC
{
    /// <summary>
    /// Initializes the Amazon EC2 client object and then calls the
    /// CreateVpcAsync method to create the VPC.
    /// </summary>
    public static async Task Main()
    {
        // If you do not want to create the VPC in the same AWS Region as
        // the default users on your system, you need to supply the AWS
        // Region as a parameter to the client constructor.
        var client = new AmazonEC2Client();

        var response = await client.CreateVpcAsync(new CreateVpcRequest
        {
            CidrBlock = "10.0.0.0/16",
        });

        Vpc vpc = response.Vpc;

        if (vpc is not null)
        {
            Console.WriteLine($"Created VPC with ID: {vpc.VpcId}.");
        }
    }
}
```

- For API details, see [CreateVpc](#) in *AWS SDK for .NET API Reference*.

## Create a security group

The following code example shows how to create an Amazon EC2 security group.

## AWS SDK for .NET

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.Threading.Tasks;
using Amazon.EC2;
using Amazon.EC2.Model;
```

```
/// <summary>
/// Shows how to create a security group for an Amazon Elastic Compute
/// Cloud (Amazon EC2) VPC using the AWS SDK for .NET version 3.7 and
/// .NET Core 5.0.
/// </summary>
public class CreateSecurityGroup
{
    /// <summary>
    /// Initializes the Amazon EC2 client object and uses the
    /// CreateSecurityGroupAsync method to create the security group.
    /// </summary>
    public static async Task Main()
    {
        string vpcId = "vpc-1234567890abcdefa";
        string vpcDescription = "Sample security group";
        string groupName = "sample-security-group";

        var client = new AmazonEC2Client();
        var response = await client.CreateSecurityGroupAsync(new
CreateSecurityGroupRequest
        {
            Description = vpcDescription,
           GroupName = groupName,
            VpcId = vpcId,
        });

        string groupId = response.GroupId;

        Console.WriteLine($"Successfully created security group: {groupName} with
ID: {groupId}");
    }
}
```

## Amazon EC2 Auto Scaling examples using AWS SDK for .NET

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for .NET with Amazon EC2 Auto Scaling.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2355\)](#)
- [Scenarios \(p. 2363\)](#)

## Actions

### Create a group

The following code example shows how to create an Auto Scaling group.

#### AWS SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Creates a new Amazon EC2 Auto Scaling group.
/// </summary>
/// <param name="client">The initialized Amazon EC2 Auto Scaling
/// client object.</param>
/// <param name="groupName">The name to use for the new Auto Scaling
/// group.</param>
/// <param name="launchTemplateName">The name of the Amazon EC2 launch template
/// to use to create instances in the group.</param>
/// <param name="serviceLinkedRoleARN">The AWS Identity and Access
/// Management (IAM) service-linked role that provides the permissions
/// to use with the Auto Scaling group.</param>
/// <returns>A Boolean value that indicates the success or failure of
/// the operation.</returns>
public static async Task<bool> CreateAutoScalingGroup(
    AmazonAutoScalingClient client,
    string groupName,
    string launchTemplateName,
    string serviceLinkedRoleARN)
{
    var templateSpecification = new LaunchTemplateSpecification
    {
        LaunchTemplateName = launchTemplateName,
    };

    var zoneList = new List<string>
    {
        "us-east-2a",
    };
}
```

```
var request = new CreateAutoScalingGroupRequest
{
    AutoScalingGroupName = groupName,
    AvailabilityZones = zoneList,
    LaunchTemplate = templateSpecification,
    MaxSize = 1,
    MinSize = 1,
    ServiceLinkedRoleARN = serviceLinkedRoleARN,
};

var response = await client.CreateAutoScalingGroupAsync(request);
Console.WriteLine(groupName + " Auto Scaling Group created");
return response.HttpStatusCode == System.Net.HttpStatusCode.OK;
}
```

- For API details, see [CreateAutoScalingGroup](#) in *AWS SDK for .NET API Reference*.

## Delete a group

The following code example shows how to delete an Auto Scaling group.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Deletes an Auto Scaling group.
/// </summary>
/// <param name="autoScalingClient">The initialized Amazon EC2 Auto Scaling
/// client object.</param>
/// <param name="groupName">The name of the Auto Scaling group.</param>
/// <returns>A Boolean value that indicates the success or failure of
/// the operation.</returns>
public static async Task<bool> DeleteAutoScalingGroupAsync(
    AmazonAutoScalingClient autoScalingClient,
    string groupName)
{

    var response = await client.SetDesiredCapacityAsync(capacityRequest);
    Console.WriteLine($"You have set the DesiredCapacity to
{desiredCapacity}.");

    return response.HttpStatusCode == System.Net.HttpStatusCode.OK;
}
```

- For API details, see [SetDesiredCapacity](#) in *AWS SDK for .NET API Reference*.

## Terminate an instance in a group

The following code example shows how to terminate an instance in an Auto Scaling group.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
///> <summary>
///> Terminates all instances in the Auto Scaling group in preparation for
///> deleting the group.
///> </summary>
///> <param name="client">The initialized Amazon EC2 Auto Scaling
///> client object.</param>
///> <param name="instanceId">The instance Id of the instance to terminate.</
param>
///> <returns>A Boolean value that indicates the success or failure of
///> the operation.</returns>
public static async Task<bool> TerminateInstanceInAutoScalingGroupAsync(
    AmazonAutoScalingClient client,
    string instanceId)
{
    var request = new TerminateInstanceInAutoScalingGroupRequest
    {
        InstanceId = instanceId,
        ShouldDecrementDesiredCapacity = false,
    };

    var response = await
client.TerminateInstanceInAutoScalingGroupAsync(request);

    if (response.HttpStatusCode == System.Net.HttpStatusCode.OK)
    {
        Console.WriteLine($"You have terminated the instance {instanceId}");
    }
}
```

```
        return true;
    }

    Console.WriteLine($"Could not terminate {instanceId}");
    return false;
}
```

- For API details, see [TerminateInstanceInAutoScalingGroup](#) in *AWS SDK for .NET API Reference*.

## Update a group

The following code example shows how to update the configuration for an Auto Scaling group.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Updates the capacity of an Auto Scaling group.
/// </summary>
/// <param name="client">The initialized Amazon EC2 Auto Scaling
/// client object.</param>
/// <param name="groupName">The name of the Auto Scaling group.</param>
/// <param name="launchTemplateName">The name of the EC2 launch template.</
param>
/// <param name="serviceLinkedRoleARN">The Amazon Resource Name (ARN)
/// of the AWS Identity and Access Management (IAM) service-linked role.</
param>
/// <param name="maxSize">The maximum number of instances that can be
/// created for the Auto Scaling group.</param>
/// <returns>A Boolean value that indicates the success or failure of
/// the update operation.</returns>
public static async Task<bool> UpdateAutoScalingGroupAsync(
    AmazonAutoScalingClient client,
    string groupName,
    string launchTemplateName,

    int maxSize)
{
    var templateSpecification = new LaunchTemplateSpecification
    {
        LaunchTemplateName = launchTemplateName,
    };

    var groupRequest = new UpdateAutoScalingGroupRequest
    {
        MaxSize = maxSize,
        ServiceLinkedRoleARN = serviceLinkedRoleARN,
        AutoScalingGroupName = groupName,
        LaunchTemplate = templateSpecification,
    };

    var response = await client.UpdateAutoScalingGroupAsync(groupRequest);
    if (response.HttpStatusCode == System.Net.HttpStatusCode.OK)
    {
        Console.WriteLine($"You successfully updated the Auto Scaling group
{groupName}.");
    }
}
```

```
        return true;
    }
    else
    {
        return false;
    }
}
```

- For API details, see [UpdateAutoScalingGroup](#) in *AWS SDK for .NET API Reference*.

## Scenarios

### Manage groups and instances

The following code example shows how to:

- Create an Amazon EC2 Auto Scaling group and configure it with a launch template and Availability Zones.
- Get information about the group and running instances.
- Enable Amazon CloudWatch metrics collection on the group.
- Update the desired capacity of the group and wait for an instance to start.
- Terminate an instance in the group.
- List scaling activities that occur in response to user requests and capacity changes.
- Get statistics for CloudWatch metrics that are collected during the example.
- Stop collecting metrics, terminate all instances, and delete the group.

## AWS Glue examples using AWS SDK for .NET

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for .NET with AWS Glue.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2370\)](#)
- [Scenarios \(p. 2379\)](#)

## Actions

### Create a crawler

The following code example shows how to create an AWS Glue crawler.

#### AWS SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Creates an AWS Glue crawler.
/// </summary>
/// <param name="glueClient">The initialized AWS Glue client.</param>
/// <param name="iam">The Amazon Resource Name (ARN) of the IAM role
/// that is used by the crawler.</param>
/// <param name="s3Path">The path to the Amazon S3 bucket where
/// data is stored.</param>
/// <param name="cron">The name of the CRON job that runs the crawler.</param>
/// <param name="dbName">The name of the database.</param>
/// <param name="crawlerName">The name of the AWS Glue crawler.</param>
/// <returns>A Boolean value indicating whether the AWS Glue crawler was
/// created successfully.</returns>
public static async Task<bool> CreateGlueCrawlerAsync(
    AmazonGlueClient glueClient,
    string iam,
    string s3Path,
    string cron,
    string dbName,
```

```
        string crawlerName)
{
    var s3Target = new S3Target
    {
        Path = s3Path,
    };

    var targetList = new List<S3Target>
    {
        s3Target,
    };

## Get runs of a job

The following code example shows how to get runs of an AWS Glue job.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Retrieves information about an AWS Glue job.
/// </summary>
/// <param name="glueClient">The initialized AWS Glue client.</param>
/// <param name="jobName">The AWS Glue object for which to retrieve run
/// information.</param>
/// <returns>A Boolean value indicating whether information about
/// the AWS Glue job runs was retrieved successfully.</returns>
public static async Task<bool> GetJobRunsAsync(AmazonGlueClient glueClient,
string jobName)
{
    var runsRequest = new GetJobRunsRequest
    {
        JobName = jobName,
        MaxResults = 20,
    };

    var response = await glueClient.GetJobRunsAsync(runsRequest);
    var jobRuns = response.JobRuns;

    if (jobRuns.Count > 0)
    {
        foreach (JobRun jobRun in jobRuns)
        {
            Console.WriteLine($"Job run state is {jobRun.JobRunState}");
            Console.WriteLine($"Job run Id is {jobRun.Id}");
            Console.WriteLine($"The Glue version is {jobRun.GlueVersion}");
        }

        return true;
    }
    else
    {
        Console.WriteLine("No jobs found.");
        return false;
    }
}
```

- For API details, see [GetJobRuns](#) in *AWS SDK for .NET API Reference*.

## Get tables from a database

The following code example shows how to get tables from a database in the AWS Glue Data Catalog.

## AWS SDK for .NET

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Gets the tables used by the database for an AWS Glue crawler.
/// </summary>
/// <param name="glueClient">The initialized AWS Glue client.</param>
/// <param name="dbName">The name of the database.</param>
/// <returns>A Boolean value indicating whether information about
/// the AWS Glue tables was retrieved successfully.</returns>
public static async Task<bool> GetGlueTablesAsync(
    AmazonGlueClient glueClient,
    string dbName)
{
    var tableRequest = new GetTablesRequest
    {
        DatabaseName = dbName,
    };

    // Get the list of AWS Glue databases.
    var response = await glueClient.GetTablesAsync(tableRequest);
    var tables = response.TableList;

    if (tables.Count > 0)
    {
        // Displays the list of table names.
        tables.ForEach(table => { Console.WriteLine($"Table name is: {table.Name}"); });
        return true;
    }
    else
    {
        Console.WriteLine("No tables found.");
        return false;
    }
}
```

- For API details, see [GetTables](#) in [AWS SDK for .NET API Reference](#).

## Start a crawler

The following code example shows how to start an AWS Glue crawler.

## AWS SDK for .NET

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Starts the named AWS Glue crawler.
/// </summary>
/// <param name="glueClient">The initialized AWS Glue client.</param>
/// <param name="crawlerName">The name of the crawler to start.</param>
```

```
    /// <returns>A Boolean value indicating whether the AWS Glue crawler  
    /// was started successfully.</returns>  
    public static async Task<bool> StartSpecificCrawlerAsync(AmazonGlueClient  
glueClient, string crawlerName)  
    {  
        var crawlerRequest = new StartCrawlerRequest  
        {  
            Name = crawlerName,  
        };  
  
        var response = await glueClient.StartCrawlerAsync(crawlerRequest);  
  
        if (response.HttpStatusCode == System.Net.HttpStatusCode.OK)  
        {  
            Console.WriteLine($"'{crawlerName}' was successfully started!");  
            return true;  
        }  
  
        Console.WriteLine($"Could not start AWS Glue crawler, '{crawlerName}'.");  
        return false;  
    }
```

- For API details, see [StartCrawler](#) in [AWS SDK for .NET API Reference](#).

## Start a job run

The following code example shows how to start an AWS Glue job run.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
    /// <summary>  
    /// Starts an AWS Glue job.  
    /// </summary>  
    /// <param name="glueClient">The initialized Glue client.</param>  
    /// <param name="jobName">The name of the AWS Glue job to start.</param>  
    /// <returns>A Boolean value indicating whether the AWS Glue job  
    /// was started successfully.</returns>  
    public static async Task<bool> StartJobAsync(AmazonGlueClient glueClient,  
string jobName)  
    {  
        var runRequest = new StartJobRunRequest  
        {  
            WorkerType = WorkerType.G1X,  
            NumberOfWorkers = 10,  
            JobName = jobName,  
        };  
  
        var response = await glueClient.StartJobRunAsync(runRequest);  
        if (response.HttpStatusCode == System.Net.HttpStatusCode.OK)  
        {  
            Console.WriteLine($"{jobName} successfully started. The job run id is  
{response.JobRunId}.");  
            return true;  
        }  
  
        Console.WriteLine($"Could not start {jobName}.");
```

```
        return false;
    }
```

- For API details, see [StartJobRun](#) in [AWS SDK for .NET API Reference](#).

## Scenarios

### Get started running crawlers and jobs

The following code example shows how to:

- Create and run a crawler that crawls a public Amazon Simple Storage Service (Amazon S3) bucket and generates a metadata database that describes the CSV-formatted data it finds.
- List information about databases and tables in your AWS Glue Data Catalog.
- Create and run a job that extracts CSV data from the source Amazon S3 bucket, transforms it by removing and renaming fields, and loads JSON-formatted output into another Amazon S3 bucket.
- List information about job runs and view some of the transformed data.
- Delete all resources created by the demo.

For more information, see [Tutorial: Getting started with AWS Glue Studio](#).

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a class that wraps AWS Glue functions that are used in the scenario.

```
namespace Glue_Basics
{
    /// <summary>
    /// Methods for working the AWS Glue by using the AWS SDK for .NET (v3.7).
    /// </summary>
    public static class GlueMethods
    {

        /// <summary>
        /// Creates a database for use by an AWS Glue crawler.
        /// </summary>
        /// <param name="glueClient">The initialized AWS Glue client.</param>
        /// <param name="dbName">The name of the new database.</param>
        /// <param name="locationUri">The location of scripts that will be
        /// used by the AWS Glue crawler.</param>
        /// <returns>A Boolean value indicating whether the AWS Glue database
        /// was created successfully.</returns>
        public static async Task<bool> CreateDatabaseAsync(AmazonGlueClient glueClient,
string dbName, string locationUri)
        {
            try
            {
                var DataBaseInput = new DatabaseInput
                {
                    Description = "Built with the AWS SDK for .NET (v3)",
                    Name = dbName,
                    LocationUri = locationUri,
                };
            }
        }
    }
}
```

```
        var request = new CreateDatabaseRequest

## IAM examples using AWS SDK for .NET

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for .NET with AWS Identity and Access Management.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2388\)](#)
- [Scenarios \(p. 2402\)](#)

## Actions

### Attach a policy to a role

The following code example shows how to attach an IAM policy to a role.

## AWS SDK for .NET

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Attach the policy to the role so that the user can assume it.
/// </summary>
/// <param name="client">The initialized IAM client object.</param>
/// <param name="policyArn">The ARN of the policy to attach.</param>
/// <param name="roleName">The name of the role to attach the policy to.</param>
public static async Task AttachRoleAsync(
    AmazonIdentityManagementServiceClient client,
    string policyArn,
    string roleName)
{
    var request = new AttachRolePolicyRequest
    {
        PolicyArn = policyArn,
        RoleName = roleName,
    };

    var response = await client.AttachRolePolicyAsync(request);

    if (response.HttpStatusCode == System.Net.HttpStatusCode.OK)
    {
        Console.WriteLine("Successfully attached the policy to the role.");
    }
    else
    {
        Console.WriteLine("Could not attach the policy.");
    }
}
```

- For API details, see [AttachRolePolicy](#) in *AWS SDK for .NET API Reference*.

## Create a policy

The following code example shows how to create an IAM policy.

## AWS SDK for .NET

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Create a policy to allow a user to list the buckets in an account.
/// </summary>
/// <param name="client">The initialized IAM client object.</param>
/// <param name="policyName">The name of the policy to create.</param>
/// <param name="policyDocument">The permissions policy document.</param>
/// <returns>The newly created ManagedPolicy object.</returns>
public static async Task<ManagedPolicy> CreatePolicyAsync(
    AmazonIdentityManagementServiceClient client,
```

```
        string policyName,
        string policyDocument)
{
    var request = new CreatePolicyRequest
    {
        PolicyName = policyName,
        PolicyDocument = policyDocument,
    };

    var response = await client.CreatePolicyAsync(request);

    return response.Policy;
}
```

- For API details, see [CreatePolicy](#) in *AWS SDK for .NET API Reference*.

## Create a role

The following code example shows how to create an IAM role.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Create a new IAM role which we can attach to a user.
/// </summary>
/// <param name="client">The initialized IAM client object.</param>
/// <param name="roleName">The name of the IAM role to create.</param>
/// <param name="rolePermissions">The permissions which the role will have.</param>
/// <returns>A Role object representing the newly created role.</returns>
public static async Task<Role> CreateRoleAsync(
    AmazonIdentityManagementServiceClient client,
    string roleName,
    string rolePermissions)
{
    var request = new CreateRoleRequest
    {
        RoleName = roleName,
        AssumeRolePolicyDocument = rolePermissions,
    };

    var response = await client.CreateRoleAsync(request);

    return response.Role;
}
```

- For API details, see [CreateRole](#) in *AWS SDK for .NET API Reference*.

## Create a user

The following code example shows how to create an IAM user.

## AWS SDK for .NET

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Create a new IAM user.
/// </summary>
/// <param name="client">The initialized IAM client object.</param>
/// <param name="userName">A string representing the user name of the
/// new user.</param>
/// <returns>The newly created user.</returns>
public static async Task<User> CreateUserAsync(
    AmazonIdentityManagementServiceClient client,
    string userName)
{
    var request = new CreateUserRequest
    {
        UserName = userName,
    };

    var response = await client.CreateUserAsync(request);

    return response.User;
}
```

- For API details, see [CreateUser](#) in *AWS SDK for .NET API Reference*.

## Create an access key

The following code example shows how to create an IAM access key.

## AWS SDK for .NET

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Create a new AccessKey for the user.
/// </summary>
/// <param name="client">The initialized IAM client object.</param>
/// <param name="userName">The name of the user for whom to create the key.</param>
/// <returns>A new IAM access key for the user.</returns>
public static async Task<AccessKey> CreateAccessKeyAsync(
    AmazonIdentityManagementServiceClient client,
    string userName)
{
    var request = new CreateAccessKeyRequest
    {
        UserName = userName,
    };

    var response = await client.CreateAccessKeyAsync(request);
```

```
        if (response.AccessKey is not null)
    {
        Console.WriteLine($"Successfully created Access Key for {userName}.");
    }

    return response.AccessKey;
}
```

- For API details, see [CreateAccessKey](#) in *AWS SDK for .NET API Reference*.

## Delete a role policy

The following code example shows how to delete an IAM role policy.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.Threading.Tasks;
using Amazon.IdentityManagement;
using Amazon.IdentityManagement.Model;

public class DeleteRolePolicy
{
    ///<summary>
    /// Initializes the IAM client object and then calls DeleteRolePolicyAsync
    /// to delete the Policy attached to the Role.
    ///</summary>
    public static async Task Main()
    {
        var client = new AmazonIdentityManagementServiceClient();
        var response = await client.DeleteRolePolicyAsync(new
DeleteRolePolicyRequest
        {
            PolicyName = "ExamplePolicy",
            RoleName = "Test-Role",
        });

        if (response.HttpStatusCode == System.Net.HttpStatusCode.OK)
        {
            Console.WriteLine("Policy successfully deleted.");
        }
        else
        {
            Console.WriteLine("Could not delete policy.");
        }
    }
}
```

## Get a policy

The following code example shows how to get an IAM policy.

## AWS SDK for .NET

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using Amazon.IdentityManagement;
using Amazon.IdentityManagement.Model;

var client = new AmazonIdentityManagementServiceClient();
var request = new GetPolicyRequest
{
    PolicyArn = "POLICY_ARN",
};

var response = await client.GetPolicyAsync(request);

Console.WriteLine($"{{response.Policy.PolicyName}} was created on ");
Console.WriteLine($"{{response.Policy.CreateDate}}");
```

- For API details, see [GetPolicy](#) in *AWS SDK for .NET API Reference*.

## Get a role

The following code example shows how to get an IAM role.

## AWS SDK for .NET

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using Amazon.IdentityManagement;
using Amazon.IdentityManagement.Model;

var client = new AmazonIdentityManagementServiceClient();

var response = await client.GetRoleAsync(new GetRoleRequest
{
    RoleName = "LambdaS3Role",
});

if (response.Role != null)
{
    Console.WriteLine($"{{response.Role.RoleName}} with ARN: {{response.Role.Arn}}");
    Console.WriteLine($"{{response.Role.Description}}");
    Console.WriteLine($"Created: {{response.Role.CreateDate}} Last used on:
{{response.Role.RoleLastUsed}}");
}
```

- For API details, see [GetRole](#) in *AWS SDK for .NET API Reference*.

## Get the account password policy

The following code example shows how to get the IAM account password policy.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using Amazon.IdentityManagement;
using Amazon.IdentityManagement.Model;

var client = new AmazonIdentityManagementServiceClient();

try
{
    var request = new GetAccountPasswordPolicyRequest();
    var response = await client.GetAccountPasswordPolicyAsync(request);

    Console.WriteLine($"{response.PasswordPolicy}");
}
catch (NoSuchEntityException ex)
{
    Console.WriteLine($"Error: {ex.Message}");
}
```

- For API details, see [GetAccountPasswordPolicy](#) in *AWS SDK for .NET API Reference*.

## List SAML providers

The following code example shows how to list SAML providers for IAM.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using Amazon.IdentityManagement;
using Amazon.IdentityManagement.Model;

var client = new AmazonIdentityManagementServiceClient();

var response = await client.ListSAMLProvidersAsync(new ListSAMLProvidersRequest());

response.SAMLProviderList.ForEach(samlProvider =>
{
    Console.WriteLine($"{samlProvider.Arn} created on: {samlProvider.CreateDate}");
});
```

- For API details, see [ListSAMLProviders](#) in *AWS SDK for .NET API Reference*.

## List groups

The following code example shows how to list IAM groups.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using Amazon.IdentityManagement;
using Amazon.IdentityManagement.Model;

var client = new AmazonIdentityManagementServiceClient();

var request = new ListGroupsRequest
{
    MaxItems = 10,
};

var response = await client.ListGroupsAsync(request);

do
{
    response.Groups.ForEach(group =>
    {
        Console.WriteLine($"{group.GroupName} created on: {group.CreateDate}");
    });

    if (response.IsTruncated)
    {
        request.Marker = response.Marker;
        response = await client.ListGroupsAsync(request);
    }
} while (response.IsTruncated);
```

- For API details, see [ListGroups](#) in *AWS SDK for .NET API Reference*.

## List inline policies for a role

The following code example shows how to list inline policies for an IAM role.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using Amazon.IdentityManagement;
using Amazon.IdentityManagement.Model;
using System;

var client = new AmazonIdentityManagementServiceClient();
var request = new ListRolePoliciesRequest
{
    RoleName = "LambdaS3Role",
};
```

```
var response = new ListRolePoliciesResponse();

do
{
    response = await client.ListRolePoliciesAsync(request);

    if (response.PolicyNames.Count > 0)
    {
        response.PolicyNames.ForEach(policyName =>
        {
            Console.WriteLine($"{policyName}");
        });
    }

    // As long as response.IsTruncated is true, set request.Marker equal
    // to response.Marker and call ListRolesAsync again.
    if (response.IsTruncated)
    {
        request.Marker = response.Marker;
    }
} while (response.IsTruncated);
```

- For API details, see [ListRolePolicies in AWS SDK for .NET API Reference](#).

## List policies

The following code example shows how to list IAM policies.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using Amazon.IdentityManagement;
using Amazon.IdentityManagement.Model;
using System;

var client = new AmazonIdentityManagementServiceClient();

var request = new ListPoliciesRequest
{
    MaxItems = 10,
};

var response = new ListPoliciesResponse();

do
{
    response = await client.ListPoliciesAsync(request);
    response.Policies.ForEach(policy =>
    {
        Console.Write($"{policy.PolicyName} ");
        Console.Write($"with ID: {policy.PolicyId} ");
        Console.Write($"and ARN: {policy.Arn}. ");
        Console.WriteLine($"It was created on {policy.CreateDate}.");
    });
}

if (response.IsTruncated)
```

```
{  
    request.Marker = response.Marker;  
}  
} while (response.IsTruncated);
```

- For API details, see [ListPolicies](#) in *AWS SDK for .NET API Reference*.

### List policies attached to a role

The following code example shows how to list policies attached to an IAM role.

#### AWS SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;  
using Amazon.IdentityManagement;  
using Amazon.IdentityManagement.Model;  
  
var client = new AmazonIdentityManagementServiceClient();  
var request = new ListAttachedRolePoliciesRequest  
{  
    MaxItems = 10,  
    RoleName = "testAssumeRole",  
};  
  
var response = await client.ListAttachedRolePoliciesAsync(request);  
  
do  
{  
    response.AttachedPolicies.ForEach(policy =>  
    {  
        Console.WriteLine($"{policy.PolicyName} with ARN: {policy.PolicyArn}");  
    });  
  
    if (response.IsTruncated)  
    {  
        request.Marker = response.Marker;  
        response = await client.ListAttachedRolePoliciesAsync(request);  
    }  
}  
} while (response.IsTruncated);
```

- For API details, see [ListAttachedRolePolicies](#) in *AWS SDK for .NET API Reference*.

### List roles

The following code example shows how to list IAM roles.

#### AWS SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using Amazon.IdentityManagement;
using Amazon.IdentityManagement.Model;

var client = new AmazonIdentityManagementServiceClient();

// Without the MaxItems value, the ListRolesAsync method will
// return information for up to 100 roles. If there are more
// than the MaxItems value or more than 100 roles, the response
// value IsTruncated will be true.
var request = new ListRolesRequest
{
    MaxItems = 10,
};

var response = new ListRolesResponse();

do
{
    response = await client.ListRolesAsync(request);
    response.Roles.ForEach(role =>
    {
        Console.WriteLine($"{role.RoleName} - ARN {role.Arn}");
    });

    // As long as response.IsTruncated is true, set request.Marker equal
    // to response.Marker and call ListRolesAsync again.
    if (response.IsTruncated)
    {
        request.Marker = response.Marker;
    }
} while (response.IsTruncated);
```

- For API details, see [ListRoles](#) in [AWS SDK for .NET API Reference](#).

## List users

The following code example shows how to list IAM users.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using Amazon.IdentityManagement;
using Amazon.IdentityManagement.Model;

var client = new AmazonIdentityManagementServiceClient();
var request = new ListUsersRequest
{
    MaxItems = 10,
};
var response = await client.ListUsersAsync(request);

do
```

```
{  
    response.Users.ForEach(user =>  
    {  
        Console.WriteLine($"'{user.UserName}' created on {user.CreateDate}.");  
        Console.WriteLine($"ARN: {user.Arn}\n");  
    });  
  
    request.Marker = response.Marker;  
    response = await client.ListUsersAsync(request);  
} while (response.IsTruncated);
```

- For API details, see [ListUsers](#) in *AWS SDK for .NET API Reference*.

## Scenarios

### Create a user and assume a role

The following code example shows how to:

- Create a user who has no permissions.
- Create a role that grants permission to list Amazon S3 buckets for the account.
- Add a policy to let the user assume the role.
- Assume the role and list Amazon S3 buckets using temporary credentials.
- Delete the policy, role, and user.

### AWS SDK for .NET

## AWS KMS examples using AWS SDK for .NET

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for .NET with AWS Key Management Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2409\)](#)

## Actions

### Create a grant for a key

The following code example shows how to create a grant for a KMS key.

#### AWS SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

This examples grants a user permission to use a key for encryption and decryption.

```
public static async Task Main()
{
    var client = new AmazonKeyManagementServiceClient();

    // The identity that is given permission to perform the operations
    // specified in the grant.
    var grantee = "arn:aws:iam::111122223333:role/ExampleRole";

    // The identifier of the AWS KMS key to which the grant applies. You
    // can use the key ID or the Amazon Resource Name (ARN) of the KMS key.
    var keyId = "7c9ecc2-38cb-4c4f-9db3-766ee8dd3ad4";
```

```
var request = new CreateGrantRequest
{
    GranteePrincipal = grantee,
    KeyId = keyId,

    // A list of operations that the grant allows.
    Operations = new List<string>
    {
        "Encrypt",
        "Decrypt",
    },
};

var response = await client.CreateGrantAsync(request);

string grantId = response.GrantId; // The unique identifier of the grant.
string grantToken = response.GrantToken; // The grant token.

Console.WriteLine($"Id: {grantId}, Token: {grantToken}");
}
```

- For API details, see [CreateGrant](#) in *AWS SDK for .NET API Reference*.

## Create a key

The following code example shows how to create an AWS KMS key.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.Threading.Tasks;
using Amazon.KeyManagementService;
using Amazon.KeyManagementService.Model;

public class CreateKey
{
    public static async Task Main()
    {
        // Note that if you need to create a Key in an AWS Region
        // other than the Region defined for the default user, you need to
        // pass the Region to the client constructor.
        var client = new AmazonKeyManagementServiceClient();

        // The call to CreateKeyAsync will create a symmetrical AWS KMS
        // key. For more information about symmetrical and asymmetrical
        // keys, see:
        //
        // https://docs.aws.amazon.com/kms/latest/developerguide/symm-asymm-
choose.html
        var response = await client.CreateKeyAsync(new CreateKeyRequest());

        // The KeyMetadata object contains information about the new AWS KMS key.
        KeyMetadata keyMetadata = response.KeyMetadata;
```

```
        if (keyMetadata is not null)
    {
        Console.WriteLine($"KMS Key: {keyMetadata.KeyId} was successfully
created.");
    }
    else
    {
        Console.WriteLine("Could not create KMS Key.");
    }
}

}
```

- For API details, see [CreateKey](#) in *AWS SDK for .NET API Reference*.

## Create an alias for a key

The following code example shows how to create an alias for a KMS key key.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.Threading.Tasks;
using Amazon.KeyManagementService;
using Amazon.KeyManagementService.Model;

public class CreateAlias
{
    public static async Task Main()
    {
        var client = new AmazonKeyManagementServiceClient();

        // The alias name must start with alias/ and can be
        // up to 256 alphanumeric characters long.
        var aliasName = "alias/ExampleAlias";

        // The value supplied as the TargetKeyId can be either
        // the key ID or key Amazon Resource Name (ARN) of the
        // AWS KMS key.
        var keyId = "1234abcd-12ab-34cd-56ef-1234567890ab";

        var request = new CreateAliasRequest
        {
            AliasName = aliasName,
            TargetKeyId = keyId,
        };

        var response = await client.CreateAliasAsync(request);

        if (response.HttpStatusCode == System.Net.HttpStatusCode.OK)
        {
            Console.WriteLine($"Alias, {aliasName}, successfully created.");
        }
        else
        {
            Console.WriteLine($"Could not create alias.");
        }
    }
}
```

```
        }  
    }  
}
```

- For API details, see [CreateAlias](#) in *AWS SDK for .NET API Reference*.

## Describe a key

The following code example shows how to describe a KMS key.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;  
using System.Threading.Tasks;  
using Amazon.KeyManagementService;  
using Amazon.KeyManagementService.Model;  
  
public class DescribeKey  
{  
    public static async Task Main()  
    {  
        var keyId = "7c9ecc2-38cb-4c4f-9db3-766ee8dd3ad4";  
        var request = new DescribeKeyRequest  
        {  
            KeyId = keyId,  
        };  
  
        var client = new AmazonKeyManagementServiceClient();  
  
        var response = await client.DescribeKeyAsync(request);  
        var metadata = response.KeyMetadata;  
  
        Console.WriteLine($"{{metadata.KeyId}} created on: {{metadata.CreationDate}}");  
        Console.WriteLine($"State: {{metadata.KeyState}}");  
        Console.WriteLine($"{{metadata.Description}}");  
    }  
}
```

- For API details, see [DescribeKey](#) in *AWS SDK for .NET API Reference*.

## Disable a key

The following code example shows how to disable a KMS key.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
```

```
using System.Threading.Tasks;
using Amazon.KeyManagementService;
using Amazon.KeyManagementService.Model;

public class DisableKey
{
    public static async Task Main()
    {
        var client = new AmazonKeyManagementServiceClient();

        // The identifier of the AWS KMS key to disable. You can use the
        // key Id or the Amazon Resource Name (ARN) of the AWS KMS key.
        var keyId = "1234abcd-12ab-34cd-56ef-1234567890ab";

        var request = new DisableKeyRequest
        {
            KeyId = keyId,
        };

        var response = await client.DisableKeyAsync(request);

        if (response.HttpStatusCode == System.Net.HttpStatusCode.OK)
        {
            // Retrieve information about the key to show that it has now
            // been disabled.
            var describeResponse = await client.DescribeKeyAsync(new
DescribeKeyRequest
{
    KeyId = keyId,
});
            Console.WriteLine($"{describeResponse.KeyMetadata.KeyId} - state:
{describeResponse.KeyMetadata.KeyState}");
        }
    }
}
```

- For API details, see [DisableKey](#) in *AWS SDK for .NET API Reference*.

## Enable a key

The following code example shows how to enable a KMS key.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.Threading.Tasks;
using Amazon.KeyManagementService;
using Amazon.KeyManagementService.Model;

public class EnableKey
{
    public static async Task Main()
    {
        var client = new AmazonKeyManagementServiceClient();

        // The identifier of the AWS KMS key to enable. You can use the
```

```
// key Id or the Amazon Resource Name (ARN) of the AWS KMS key.  
var keyId = "1234abcd-12ab-34cd-56ef-1234567890ab";  
  
var request = new EnableKeyRequest  
{  
    KeyId = keyId,  
};  
  
var response = await client.EnableKeyAsync(request);  
if (response.HttpStatusCode == System.Net.HttpStatusCode.OK)  
{  
    // Retrieve information about the key to show that it has now  
    // been enabled.  
    var describeResponse = await client.DescribeKeyAsync(new  
DescribeKeyRequest  
{  
    KeyId = keyId,  
});  
    Console.WriteLine($"{describeResponse.KeyMetadata.KeyId} - state:  
{describeResponse.KeyMetadata.KeyState}");  
}  
}  
}
```

- For API details, see [EnableKey](#) in *AWS SDK for .NET API Reference*.

## List aliases for a key

The following code example shows how to list aliases for a KMS key.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;  
using System.Threading.Tasks;  
using Amazon.KeyManagementService;  
using Amazon.KeyManagementService.Model;  
  
public class ListAliases  
{  
    public static async Task Main()  
    {  
        var client = new AmazonKeyManagementServiceClient();  
        var request = new ListAliasesRequest();  
        var response = new ListAliasesResponse();  
  
        do  
        {  
            response = await client.ListAliasesAsync(request);  
  
            responseAliases.ForEach(alias =>  
            {  
                Console.WriteLine($"Created: {alias.CreationDate} Last Update:  
{alias.LastUpdatedDate} Name: {alias.AliasName}");  
            });  
  
            request.Marker = response.NextMarker;  
        } while (response.NextMarker != null);  
    }  
}
```

```
        }
        while (response.Truncated);
    }
}
```

- For API details, see [ListAliases](#) in *AWS SDK for .NET API Reference*.

## List grants for a key

The following code example shows how to list grants for a KMS key.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.Threading.Tasks;
using Amazon.KeyManagementService;
using Amazon.KeyManagementService.Model;

public class ListGrants
{
    public static async Task Main()
    {
        // The identifier of the AWS KMS key to disable. You can use the
        // key Id or the Amazon Resource Name (ARN) of the AWS KMS key.
        var keyId = "1234abcd-12ab-34cd-56ef-1234567890ab";
        var client = new AmazonKeyManagementServiceClient();
        var request = new ListGrantsRequest
        {
            KeyId = keyId,
        };

        var response = new ListGrantsResponse();

        do
        {
            response = await client.ListGrantsAsync(request);

            response.Grants.ForEach(grant =>
            {
                Console.WriteLine($"{grant.GrantId}");
            });

            request.Marker = response.NextMarker;
        }
        while (response.Truncated);
    }
}
```

## Update function configuration

The following code example shows how to update Lambda function configuration.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public async Task<bool> UpdateFunctionConfigurationAsync(
    AmazonLambdaClient client,
    string functionName,
    string functionHandler,
    Dictionary<string, string> environmentVariables)
{
    var request = new UpdateFunctionConfigurationRequest
    {
        Handler = functionHandler,
        FunctionName = functionName,
        Environment = new Amazon.Lambda.Model.Environment { Variables =
environmentVariables },
    };

    var response = await client.UpdateFunctionConfigurationAsync(request);

    Console.WriteLine(response.LastModified);

    return response.HttpStatusCode == System.Net.HttpStatusCode.OK;
}
```

- For API details, see [UpdateFunctionConfiguration](#) in *AWS SDK for .NET API Reference*.

## Scenarios

### Get started with functions

The following code example shows how to:

- Create an AWS Identity and Access Management (IAM) role that grants Lambda permission to write to logs.
- Create a Lambda function and upload handler code.

- Invoke the function with a single parameter and get results.
- Update the function code and configure its Lambda environment with an environment variable.
- Invoke the function with new parameters and get results. Display the execution log that's returned from the invocation.
- List the functions for your account.
- Delete the IAM role and the Lambda function.

For more information, see [Create a Lambda function with the console](#).

```

Define a Lambda handler that increments a number.

```
using Amazon.Lambda.Core;

// Assembly attribute to enable the Lambda function's JSON input to be converted into
// a .NET class.
[assembly:
LambdaSerializer(typeof(Amazon.Lambda.Serialization.SystemTextJson.DefaultLambdaJsonSerializer))]

namespace LambdaIncrement;

public class Function
{

    /// <summary>
    /// A simple function increments the integer parameter.
    /// </summary>
    /// <param name="input">A JSON string containing an action, which must be
    /// "increment" and a string representing the value to increment.</param>
    /// <param name="context">The context object passed by Lambda containing
    /// information about invocation, function, and execution environment.</param>
    /// <returns>A string representing the incremented value of the parameter.</returns>
    public int FunctionHandler(Dictionary<string, string> input, ILambdaContext
context)
    {
        if (input["action"] == "increment")
        {
            int inputValue = Convert.ToInt32(input["x"]);
            return inputValue + 1;
        }
        else
        {
            return 0;
        }
    }
}
```

Define a second Lambda handler that performs arithmetic operations.

```
using Amazon.Lambda.Core;
using System.Diagnostics;

// Assembly attribute to enable the Lambda function's JSON input to be converted into
// a .NET class.
[assembly:
LambdaSerializer(typeof(Amazon.Lambda.Serialization.SystemTextJson.DefaultLambdaJsonSerializer))]

namespace LambdaCalculator;

public class Function
{

    /// <summary>
    /// A simple function that takes two number in string format and performs
    /// the requested arithmetic function.
    /// </summary>
    /// <param name="input">JSON data containing an action, and x and y values.
    /// Valid actions include: add, subtract, multiply, and divide.</param>
    /// <param name="context">The context object passed by Lambda containing
    /// information about invocation, function, and execution environment.</param>
    /// <returns>A string representing the results of the calculation.</returns>
    public int FunctionHandler(Dictionary<string, string> input, ILambdaContext
context)
{
    var action = input["action"];
    int x = Convert.ToInt32(input["x"]);
    int y = Convert.ToInt32(input["y"]);
    int result;
    switch (action)
    {
        case "add":
            result = x + y;
            break;
        case "subtract":
            result = x - y;
            break;
        case "multiply":
            result = x * y;
            break;
        case "divide":
            if (y == 0)
            {
                Console.Error.WriteLine("Divide by zero error.");
                result = 0;
            }
            else
                result = x / y;
            break;
        default:
            Console.Error.WriteLine($"{action} is not a valid operation.");
            result = 0;
            break;
    }
    return result;
}
}

## Organizations examples using AWS SDK for .NET

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for .NET with AWS Organizations.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2439\)](#)

## Actions

### Attach a policy to a target

The following code example shows how to attach an Organizations policy to a target.

#### AWS SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.Threading.Tasks;
using Amazon.Organizations;
using Amazon.Organizations.Model;

///<summary>
/// Shows how to attach an AWS Organizations policy to an organization,
/// an organizational unit, or an account.
///</summary>
public class AttachPolicy
{
    ///<summary>
    /// Initializes the Organizations client object and then calls the
    /// AttachPolicyAsync method to attach the policy to the root
    /// organization.
    ///</summary>
    public static async Task Main()
    {
        IAmazonOrganizations client = new AmazonOrganizationsClient();
        var policyId = "p-00000000";
        var targetId = "r-0000";

        var request = new AttachPolicyRequest
```

```
{  
    PolicyId = policyId,  
    TargetId = targetId,  
};  
  
var response = await client.AttachPolicyAsync(request);  
  
if (response.HttpStatusCode == System.Net.HttpStatusCode.OK)  
{  
    Console.WriteLine($"Successfully attached Policy ID {policyId} to  
Target ID: {targetId}.");  
}  
else  
{  
    Console.WriteLine("Was not successful in attaching the policy.");  
}  
}  
}
```

## Amazon Polly examples using AWS SDK for .NET

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for .NET with Amazon Polly.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2451\)](#)

## Actions

### Delete a lexicon

The following code example shows how to delete an Amazon Polly lexicon.

#### AWS SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.Threading.Tasks;
using Amazon.Polly;
using Amazon.Polly.Model;

public class DeleteLexicon
{
    public static async Task Main()
    {
        string lexiconName = "SampleLexicon";

        var client = new AmazonPollyClient();

        var success = await DeletePollyLexiconAsync(client, lexiconName);

        if (success)
        {
            Console.WriteLine($"Successfully deleted {lexiconName}.");
        }
        else
        {
            Console.WriteLine($"Could not delete {lexiconName}.");
        }
    }

    ///<summary>
    /// Deletes the named Amazon Polly lexicon.
    ///</summary>
    ///<param name="client">The initialized Amazon Polly client object.</param>
    ///<param name="lexiconName">The name of the Amazon Polly lexicon to
    /// delete.</param>
    ///<returns>A Boolean value indicating the success of the operation.</returns>
    public static async Task<bool> DeletePollyLexiconAsync(
        AmazonPollyClient client,
        string lexiconName)
    {
        var deleteLexiconRequest = new DeleteLexiconRequest()
        {
            Name = lexiconName,
        };

        var response = await client.DeleteLexiconAsync(deleteLexiconRequest);

        return response.HttpStatusCode == System.Net.HttpStatusCode.OK;
    }
}
```

```
    }
```

- For API details, see [DeleteLexicon](#) in *AWS SDK for .NET API Reference*.

## Get a lexicon

The following code example shows how to get an Amazon Polly lexicon.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.Threading.Tasks;
using Amazon.Polly;
using Amazon.Polly.Model;

public class GetLexicon
{
    public static async Task Main(string[] args)
    {
        string lexiconName = "SampleLexicon";

        var client = new AmazonPollyClient();

        await GetPollyLexiconAsync(client, lexiconName);
    }

    public static async Task GetPollyLexiconAsync(AmazonPollyClient client, string lexiconName)
    {
        var getLexiconRequest = new GetLexiconRequest()
        {
            Name = lexiconName,
        };

        try
        {
            var response = await client.GetLexiconAsync(getLexiconRequest);
            Console.WriteLine($"Lexicon:\n Name: {response.Lexicon.Name}");
            Console.WriteLine($"Content: {response.Lexicon.Content}");
        }
        catch (Exception ex)
        {
            Console.WriteLine("Error: " + ex.Message);
        }
    }
}
```

- For API details, see [GetLexicon](#) in *AWS SDK for .NET API Reference*.

## Get voices available for synthesis

The following code example shows how to get Amazon Polly voices available for synthesis.

## AWS SDK for .NET

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.Threading.Tasks;
using Amazon.Polly;
using Amazon.Polly.Model;

public class DescribeVoices

        {
            Console.WriteLine("Exception caught: " + ex.Message);
        }
    }

    public static void DisplayVoiceInfo(Voice voice)
    {
```

```
        Console.WriteLine($" Name: {voice.Name}\tGender: {voice.Gender}\tLanguageName: {voice.LanguageName}");
    }
}
```

- For API details, see [DescribeVoices](#) in *AWS SDK for .NET API Reference*.

## List pronunciation lexicons

The following code example shows how to list Amazon Polly pronunciation lexicons.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.Threading.Tasks;
using Amazon.Polly;
using Amazon.Polly.Model;

public class ListLexicons
{
    public static async Task Main()
    {
        var client = new AmazonPollyClient();
        var request = new ListLexiconsRequest();

        try
        {
            Console.WriteLine("All voices: ");

            do
            {
                var response = await client.ListLexiconsAsync(request);
                request.NextToken = response.NextToken;

                response.Lexicons.ForEach(lexicon =>
                {
                    var attributes = lexicon.Attributes;
                    Console.WriteLine($"Name: {lexicon.Name}");
                    Console.WriteLine($" \tAlphabet: {attributes.Alphabet}");
                    Console.WriteLine($" \tLanguageCode: {attributes.LanguageCode}");
                    Console.WriteLine($" \tLastModified: {attributes.LastModified}");
                    Console.WriteLine($" \tLexemesCount: {attributes.LexemesCount}");
                    Console.WriteLine($" \tLexiconArn: {attributes.LexiconArn}");
                    Console.WriteLine($" \tSize: {attributes.Size}");
                });
            }
            while (request.NextToken is not null);
        }
        catch (Exception ex)
        {
            Console.WriteLine($"Error: {ex.Message}");
        }
    }
}
```

```
}
```

- For API details, see [ListLexicons](#) in *AWS SDK for .NET API Reference*.

## Store a pronunciation lexicon

The following code example shows how to store an Amazon Polly pronunciation lexicon.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.Threading.Tasks;
using Amazon.Polly;
using Amazon.Polly.Model;

public class PutLexicon
{
    public static async Task Main()
    {
        string lexiconContent = "<?xml version=\"1.0\" encoding=\"UTF-8\"?>" +
            "<lexicon version=\"1.0\" xmlns=\"http://www.w3.org/2005/01/" +
            "pronunciation-lexicon\" xmlns:xsi=\"http://www.w3.org/2001/XMLSchema-instance\" " +
            "xsi:schemaLocation=\"http://www.w3.org/2005/01/pronunciation-lexicon" +
            "http://www.w3.org/TR/2007/CR-pronunciation-lexicon-20071212/pls.xsd\" " +
            "alphabet=\"ipa\" xml:lang=\"en-US\">" +
            "<lexeme><grapheme>test1</grapheme><alias>test2</alias></lexeme>" +
            "</lexicon>";
        string lexiconName = "SampleLexicon";

        var client = new AmazonPollyClient();
        var putLexiconRequest = new PutLexiconRequest()
        {
            Name = lexiconName,
            Content = lexiconContent,
        };

        try
        {
            var response = await client.PutLexiconAsync(putLexiconRequest);
            if (response.HttpStatusCode == System.Net.HttpStatusCode.OK)
            {
                Console.WriteLine($"Successfully created Lexicon: {lexiconName}.");
            }
            else
            {
                Console.WriteLine($"Could not create Lexicon: {lexiconName}.");
            }
        }
        catch (Exception ex)

            Console.WriteLine("Exception caught: " + ex.Message);
        }
    }
}
```

- For API details, see [PutLexicon](#) in *AWS SDK for .NET API Reference*.

## Synthesize speech from text

The following code example shows how to synthesize speech from text with Amazon Polly.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.IO;
using System.Threading.Tasks;
using Amazon.Polly;
using Amazon.Polly.Model;

public class SynthesizeSpeech
{
    public static async Task Main()
    {
        string outputFileName = "speech.mp3";
        string text = "Twas brillig, and the slithy toves did gyre and gimbal in
the wabe";

        var client = new AmazonPollyClient();
        var response = await PollySynthesizeSpeech(client, text);

        WriteSpeechToStream(response.AudioStream, outputFileName);
    }

    ///<summary>
    /// Calls the Amazon Polly SynthesizeSpeechAsync method to convert text
    /// to speech.
    ///</summary>
    ///<param name="client">The Amazon Polly client object used to connect
    /// to the Amazon Polly service.</param>
    ///<param name="text">The text to convert to speech.</param>
    ///<returns>A SynthesizeSpeechResponse object that includes an AudioStream
    /// object with the converted text.</returns>
    private static async Task<SynthesizeSpeechResponse>
PollySynthesizeSpeech(IAmazonPolly client, string text)
    {
        var synthesizeSpeechRequest = new SynthesizeSpeechRequest()
        {
            OutputFormat = OutputFormat.Mp3,
            VoiceId = VoiceId.Joanna,
            Text = text,
        };

        var synthesizeSpeechResponse =
            await client.SynthesizeSpeechAsync(synthesizeSpeechRequest);

        return synthesizeSpeechResponse;
    }

    ///<summary>
    /// Writes the AudioStream returned from the call to
    /// SynthesizeSpeechAsync to a file in MP3 format.
    ///</summary>
    ///<param name="audioStream">The AudioStream returned from the
    /// call to the SynthesizeSpeechAsync method.</param>
```

```
    /// <param name="outputFileName">The full path to the file in which to
    /// save the audio stream.</param>
    private static void WriteSpeechToStream(Stream audioStream, string
outputFileName)
    {
        var outputStream = new FileStream(
            outputFileName,
            FileMode.Create,
            FileAccess.Write);
        byte[] buffer = new byte[2 * 1024];
        int readBytes;

        while ((readBytes = audioStream.Read(buffer, 0, 2 * 1024)) > 0)
        {
            outputStream.Write(buffer, 0, readBytes);
        }

        // Flushes the buffer to avoid losing the last second or so of
        // the synthesized text.
        outputStream.Flush();
        Console.WriteLine($"Saved {outputFileName} to disk.");
    }
}
```

Synthesize speech from text using speech marks with Amazon Polly using an AWS SDK.

```
using System;
using System.Collections.Generic;
using System.IO;
using System.Threading.Tasks;
using Amazon.Polly;
using Amazon.Polly.Model;

public class SynthesizeSpeechMarks
{
    public static async Task Main()
    {
        var client = new AmazonPollyClient();
        string outputFileName = "speechMarks.json";

        var synthesizeSpeechRequest = new SynthesizeSpeechRequest()
        {
            OutputFormat = OutputFormat.Json,
            SpeechMarkTypes = new List<string>
            {
                SpeechMarkType.Viseme,
                SpeechMarkType.Word,
            },
            VoiceId = VoiceId.Joanna,
            Text = "This is a sample text to be synthesized.",
        };

        try
        {
            using (var outputStream = new FileStream(outputFileName,
FileMode.Create, FileAccess.Write))
            {
                var synthesizeSpeechResponse = await
client.SynthesizeSpeechAsync(synthesizeSpeechRequest);
                var buffer = new byte[2 * 1024];
                int readBytes;

                var inputStream = synthesizeSpeechResponse.AudioStream;
```

```
        while ((readBytes = inputStream.Read(buffer, 0, 2 * 1024)) > 0)
        {
            outputStream.Write(buffer, 0, readBytes);
        }
    }
catch (Exception ex)
{
    Console.WriteLine($"Error: {ex.Message}");
}
}
```

- For API details, see [SynthesizeSpeech](#) in *AWS SDK for .NET API Reference*.

## Amazon RDS examples using AWS SDK for .NET

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for .NET with Amazon Relational Database Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2458\)](#)
- [Scenarios \(p. 2465\)](#)

## Actions

### Create a DB instance

The following code example shows how to create an Amazon RDS DB instance and wait for it to become available.

#### AWS SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Create an RDS DB instance with a particular set of properties. Use the action
DescribeDBInstancesAsync
/// to determine when the DB instance is ready to use.
/// </summary>
/// <param name="dBName">Name for the DB instance.</param>
/// <param name="dBInstanceIdentifier">DB instance identifier.</param>
/// <param name="parameterGroupName">DB parameter group to associate with the
instance.</param>
/// <param name="dBEngine">The engine for the DB instance.</param>
/// <param name="dBEngineVersion">Version for the DB instance.</param>
/// <param name="instanceClass">Class for the DB instance.</param>
/// <param name="allocatedStorage">The amount of storage in gibibytes (GiB) to
allocate to the DB instance.</param>
/// <param name="adminName">Admin user name.</param>
```

```
/// <param name="adminPassword">Admin user password.</param>
/// <returns>DB instance object.</returns>
public async Task<DBInstance> CreateDBInstance(string dbName, string
dbInstanceIdentifier,
    string parameterGroupName, string dbEngine, string dbEngineVersion,
    string instanceClass, int allocatedStorage, string adminName, string
adminPassword)
{
    var response = await _amazonRDS.CreateDBInstanceAsync(
        new CreateDBInstanceRequest()
    {
        DBName = dbName,
        DBInstanceIdentifier = dbInstanceIdentifier,
        DBParameterGroupName = parameterGroupName,
        Engine = dbEngine,
        EngineVersion = dbEngineVersion,
        DBInstanceClass = instanceClass,
        AllocatedStorage = allocatedStorage,
        MasterUsername = adminName,
        MasterUserPassword = adminPassword
    });

    return response.DBInstance;
}
```

- For API details, see [CreateDBInstance](#) in *AWS SDK for .NET API Reference*.

## Create a DB parameter group

The following code example shows how to create an Amazon RDS DB parameter group.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Create a new DB parameter group. Use the action DescribeDBParameterGroupsAsync
/// to determine when the DB parameter group is ready to use.
/// </summary>
/// <param name="name">Name of the DB parameter group.</param>
/// <param name="family">Family of the DB parameter group.</param>
/// <param name="description">Description of the DB parameter group.</param>
/// <returns>The new DB parameter group.</returns>
public async Task<DBParameterGroup> CreateDBParameterGroup(
    string name, string family, string description)
{
    var response = await _amazonRDS.CreateDBParameterGroupAsync(
        new CreateDBParameterGroupRequest()
    {
        DBParameterGroupName = name,
        DBParameterGroupFamily = family,
        Description = description
    });
    return response.DBParameterGroup;
}
```

- For API details, see [CreateDBParameterGroup](#) in *AWS SDK for .NET API Reference*.

## Create a snapshot of a DB instance

The following code example shows how to create a snapshot of an Amazon RDS DB instance.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Create a snapshot of a DB instance.
/// </summary>
/// <param name="dbInstanceIdentifier">DB instance identifier.</param>
/// <param name="snapshotIdentifier">Identifier for the snapshot.</param>
/// <returns>DB snapshot object.</returns>
public async Task<DBSnapshot> CreateDBSnapshot(string dbInstanceIdentifier, string
snapshotIdentifier)
{
    var response = await _amazonRDS.CreateDBSnapshotAsync(
        new CreateDBSnapshotRequest()
    {
        DBSnapshotIdentifier = snapshotIdentifier,
        DBInstanceIdentifier = dbInstanceIdentifier
    });

    return response.DBSnapshot;
}
```

- For API details, see [CreateDBSnapshot](#) in *AWS SDK for .NET API Reference*.

## Delete a DB instance

The following code example shows how to delete an Amazon RDS DB instance.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Delete a particular DB instance.
/// </summary>
/// <param name="dbInstanceIdentifier">DB instance identifier.</param>
/// <returns>DB instance object.</returns>
public async Task<DBInstance> DeleteDBInstance(string dbInstanceIdentifier)
{
    var response = await _amazonRDS.DeleteDBInstanceAsync(
        new DeleteDBInstanceRequest()
    {
        DBInstanceIdentifier = dbInstanceIdentifier,
        SkipFinalSnapshot = true,
        DeleteAutomatedBackups = true
    });
}
```

```
        });

        return response.DBInstance;
    }
}
```

- For API details, see [DeleteDBInstance](#) in *AWS SDK for .NET API Reference*.

## Delete a DB parameter group

The following code example shows how to delete an Amazon RDS DB parameter group.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Delete a DB parameter group. The group cannot be a default DB parameter group
/// or be associated with any DB instances.
/// </summary>
/// <param name="name">Name of the DB parameter group.</param>
/// <returns>True if successful.</returns>
public async Task<bool> DeleteDBParameterGroup(string name)
{
    var response = await _amazonRDS.DeleteDBParameterGroupAsync(
        new DeleteDBParameterGroupRequest()
    {
        DBParameterGroupName = name,
    });
    return response.HttpStatusCode == HttpStatusCode.OK;
}
```

- For API details, see [DeleteDBParameterGroup](#) in *AWS SDK for .NET API Reference*.

## Describe DB instances

The following code example shows how to describe Amazon RDS DB instances.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Returns a list of DB instances.
/// </summary>
/// <param name="dbInstanceIdentifier">Optional name of a specific DB instance.</param>
/// <returns>List of DB instances.</returns>
public async Task<List<DBInstance>> DescribeDBInstances(string dbInstanceIdentifier
= null)
{
}
```

```
var results = new List<DBInstance>();
var instancesPaginator = _amazonRDS.Paginator.DescribeDBInstances(
    new DescribeDBInstancesRequest
    {
        DBInstanceIdentifier = dbInstanceIdentifier
    });
// Get the entire list using the paginator.
await foreach (var instances in instancesPaginator.DBInstances)
{
    results.Add(instances);
}
return results;
}
```

- For API details, see [DescribeDBInstances](#) in *AWS SDK for .NET API Reference*.

## Describe DB parameter groups

The following code example shows how to describe Amazon RDS DB parameter groups.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Get descriptions of DB parameter groups.
/// </summary>
/// <param name="name">Optional name of the DB parameter group to describe.</param>
/// <returns>The list of DB parameter group descriptions.</returns>
public async Task<List<DBParameterGroup>> DescribeDBParameterGroups(string name =
null)
{
    var response = await _amazonRDS.DescribeDBParameterGroupsAsync(
        new DescribeDBParameterGroupsRequest()
    {
        DBParameterGroupName = name
    });
    return response.DBParameterGroups;
}
```

- For API details, see [DescribeDBParameterGroups](#) in *AWS SDK for .NET API Reference*.

## Describe database engine versions

The following code example shows how to describe Amazon RDS database engine versions.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Get a list of DB engine versions for a particular DB engine.
/// </summary>
/// <param name="engine">Name of the engine.</param>
/// <param name="dbParameterGroupFamily">Optional parameter group family name.</param>
/// <returns>List of DBEngineVersions.</returns>
public async Task<List<DBEngineVersion>> DescribeDBEngineVersions(string engine,
    string dbParameterGroupFamily = null)
{
    var response = await _amazonRDS.DescribeDBEngineVersionsAsync(
        new DescribeDBEngineVersionsRequest()
    {
        Engine = engine,
        DBParameterGroupFamily = dbParameterGroupFamily
    });
    return response.DBEngineVersions;
}
```

- For API details, see [DescribeDBEngineVersions](#) in *AWS SDK for .NET API Reference*.

## Describe options for DB instances

The following code example shows how to describe options for Amazon RDS DB instances.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Get a list of orderable DB instance options for a specific
/// engine and engine version.
/// </summary>
/// <param name="engine">Name of the engine.</param>
/// <param name="engineVersion">Version of the engine.</param>
/// <returns>List of OrderableDBInstanceOptions.</returns>
public async Task<List<OrderableDBInstanceOption>>
DescribeOrderableDBInstanceOptions(string engine, string engineVersion)
{
    // Use a paginator to get a list of DB instance options.
    var results = new List<OrderableDBInstanceOption>();
    var paginateInstanceOptions =
_amazonRDS.Paginator.DescribeOrderableDBInstanceOptions(
    new DescribeOrderableDBInstanceOptionsRequest()
    {
        Engine = engine,
        EngineVersion = engineVersion,
    });
    // Get the entire list using the paginator.
    await foreach (var instanceOptions in
paginateInstanceOptions.OrderableDBInstanceOptions)
    {
        results.Add(instanceOptions);
    }
    return results;
}
```

- For API details, see [DescribeOrderableDBInstanceOptions](#) in *AWS SDK for .NET API Reference*.

## Describe parameters in a DB parameter group

The following code example shows how to describe parameters in an Amazon RDS DB parameter group.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
///<summary>
/// Get a list of DB parameters from a specific parameter group.
///</summary>
///<param name="dbParameterGroupName">Name of a specific DB parameter group.</param>
///<param name="source">Optional source for selecting parameters.</param>
///<returns>List of parameter values.</returns>
public async Task<List<Parameter>> DescribeDBParameters(string dbParameterGroupName, string source = null)
{
    var results = new List<Parameter>();
    var paginateParameters = _amazonRDS.Paginator.DescribeDBParameters(
        new DescribeDBParametersRequest()
    {
        DBParameterGroupName = dbParameterGroupName,
        Source = source
    });
    // Get the entire list using the paginator.
    await foreach (var parameters in paginateParameters.Parameters)
    {
        results.Add(parameters);
    }
    return results;
}
```

- For API details, see [DescribeDBParameters](#) in *AWS SDK for .NET API Reference*.

## Describe snapshots of DB instances

The following code example shows how to describe snapshots of Amazon RDS DB instances.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
///<summary>
/// Return a list of DB snapshots for a particular DB instance.
///</summary>
///<param name="dbInstanceIdentifier">DB instance identifier.</param>
///<returns>List of DB snapshots.</returns>
```

```
public async Task<List<DBSnapshot>> DescribeDBSnapshots(string dbInstanceIdentifier)
{
    var results = new List<DBSnapshot>();
    var snapshotsPaginator = _amazonRDS.Paginator.DescribeDBSnapshots(
        new DescribeDBSnapshotsRequest()
    {
        DBInstanceIdentifier = dbInstanceIdentifier
    });

    // Get the entire list using the paginator.
    await foreach (var snapshots in snapshotsPaginator.DBSnapshots)
    {
        results.Add(snapshots);
    }
    return results;
}
```

- For API details, see [DescribeDBSnapshots](#) in *AWS SDK for .NET API Reference*.

## Update parameters in a DB parameter group

The following code example shows how to update parameters in an Amazon RDS DB parameter group.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
///<summary>
/// Update a DB parameter group. Use the action DescribeDBParameterGroupsAsync
/// to determine when the DB parameter group is ready to use.
///</summary>
///<param name="name">Name of the DB parameter group.</param>
///<param name="parameters">List of parameters. Maximum of 20 per request.</param>
///<returns>The updated DB parameter group name.</returns>
public async Task<string> ModifyDBParameterGroup(
    string name, List<Parameter> parameters)
{
    var response = await _amazonRDS.ModifyDBParameterGroupAsync(
        new ModifyDBParameterGroupRequest()
    {
        DBParameterGroupName = name,
        Parameters = parameters,
    });
    return response.DBParameterGroupName;
}
```

- For API details, see [ModifyDBParameterGroup](#) in *AWS SDK for .NET API Reference*.

## Scenarios

### Get started with DB instances

The following code example shows how to:

- Create a custom DB parameter group and set parameter values.
- Create a DB instance that's configured to use the parameter group. The DB instance also contains a database.
- Take a snapshot of the instance.
- Delete the instance and parameter group.

## AWS SDK for .NET

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Run an interactive scenario at a command prompt.

```
/// <summary>
/// Scenario for RDS DB instance example.
/// </summary>
public class RDSDInstanceScenario
{
    /*
        Before running this .NET code example, set up your development environment,
        including your credentials.

        This .NET example performs the following tasks:
        1. Returns a list of the available DB engine families using the
        DescribeDBEngineVersionsAsync method.
        2. Selects an engine family and creates a custom DB parameter group using the
        CreateDBParameterGroupAsync method.
        3. Gets the parameter groups using the DescribeDBParameterGroupsAsync method.
        4. Gets parameters in the group using the DescribeDBParameters method.
        5. Parses and displays parameters in the group.
        6. Modifies both the auto_increment_offset and auto_increment_increment parameters
        using the ModifyDBParameterGroupAsync method.
        7. Gets and displays the updated parameters using the DescribeDBParameters method
        with a source of "user".
        8. Gets a list of allowed engine versions using the DescribeDBEngineVersionsAsync
        method.
        9. Displays and selects from a list of micro instance classes available for the
        selected engine and version.
        10. Creates an RDS DB instance that contains a MySql database and uses the
        parameter group
            using the CreateDBInstanceAsync method.
        11. Waits for DB instance to be ready using the DescribeDBInstancesAsync method.
        12. Prints out the connection endpoint string for the new DB instance.
        13. Creates a snapshot of the DB instance using the CreateDBSnapshotAsync method.
        14. Waits for DB snapshot to be ready using the DescribeDBSnapshots method.
        15. Deletes the DB instance using the DeleteDBInstanceAsync method.
        16. Waits for DB instance to be deleted using the DescribeDbInstances method.
        17. Deletes the parameter group using the DeleteDBParameterGroupAsync.

## Amazon Rekognition examples using AWS SDK for .NET

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for .NET with Amazon Rekognition.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2479\)](#)

## Actions

### Compare faces in an image against a reference image

The following code example shows how to compare faces in an image against a reference image with Amazon Rekognition.

For more information, see [Comparing faces in images](#).

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;  
using System.IO;
```

```
using System.Threading.Tasks;
using Amazon.Rekognition;

            },
        };

        var searchFacesByImageRequest = new SearchFacesByImageRequest()
        {
            CollectionId = collectionId,
            Image = image,
            FaceMatchThreshold = 70F,
            MaxFaces = 2,
        };

        SearchFacesByImageResponse searchFacesByImageResponse = await
rekognitionClient.SearchFacesByImageAsync(searchFacesByImageRequest);

        Console.WriteLine("Faces matching largest face in image from " + photo);
        searchFacesByImageResponse.FaceMatches.ForEach(face =>
        {
            Console.WriteLine($"FaceId: {face.Face.FaceId}, Similarity:
{face.Similarity}");
        });
    }
}
```

- For API details, see [SearchFacesByImage](#) in *AWS SDK for .NET API Reference*.

## Route 53 domain registration examples using AWS SDK for .NET

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for .NET with Amazon Route 53 domain registration.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Get started

#### Hello Route 53 domain registration

The following code example shows how to get started using Amazon Route 53 domain registration.

.NET

#### AWS SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
public static class HelloRoute53Domains
{
    static async Task Main(string[] args)
    {
        // Use the AWS .NET Core Setup package to set up dependency injection for
        // the Amazon Route 53 domain registration service.
        // Use your AWS profile name, or leave it blank to use the default profile.
        using var host = Host.CreateDefaultBuilder(args)
            .ConfigureServices((_, services) =>
                services.AddAWSService<IAmazonRoute53Domains>()
            ).Build();

        // Now the client is available for injection.
        var route53Client =
            host.Services.GetRequiredService<IAmazonRoute53Domains>();

        // You can use await and any of the async methods to get a response.
        var response = await route53Client.ListPricesAsync(new ListPricesRequest
        { Tld = "com" });
        Console.WriteLine($"Hello Amazon Route 53 Domains! Following are prices
        for .com domain operations:");
        var comPrices = response.Prices.FirstOrDefault();
        if (comPrices != null)
        {
            Console.WriteLine($"\\tRegistration:
{comPrices.RegistrationPrice?.Price} {comPrices.RegistrationPrice?.Currency}");
            Console.WriteLine($"\\tRenewal: {comPrices.RenewalPrice?.Price}
{comPrices.RenewalPrice?.Currency}");
        }
    }
}
```

- For API details, see [ListPrices](#) in *AWS SDK for .NET API Reference*.

## Topics

- [Actions \(p. 2500\)](#)
- [Scenarios \(p. 2506\)](#)

## Actions

### Check domain availability

The following code example shows how to check the availability of a domain.

#### AWS SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Check the availability of a domain name.
/// </summary>
/// <param name="domain">The domain to check for availability.</param>
/// <returns>An availability result string.</returns>
public async Task<string> CheckDomainAvailability(string domain)
{
    var result = await _amazonRoute53Domains.CheckDomainAvailabilityAsync(
        new CheckDomainAvailabilityRequest
    {
        DomainName = domain
    });
    return result.Availability.Value;
}
```

- For API details, see [CheckDomainAvailability](#) in *AWS SDK for .NET API Reference*.

### Check domain transferability

The following code example shows how to check the transferability of a domain.

#### AWS SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Check the transferability of a domain name.
/// </summary>
/// <param name="domain">The domain to check for transferability.</param>
/// <returns>A transferability result string.</returns>
public async Task<string> CheckDomainTransferability(string domain)
{
    var result = await _amazonRoute53Domains.CheckDomainTransferabilityAsync(
        new CheckDomainTransferabilityRequest
    {
        DomainName = domain
    });
}
```

```
        );
    return result.Transferability.Transferable.Value;
}
```

- For API details, see [CheckDomainTransferability](#) in *AWS SDK for .NET API Reference*.

## Get domain details

The following code example shows how to get the details for a domain.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
///<summary>
/// Get details for a domain.
///</summary>
///<returns>A string with detail information about the domain.</returns>
public async Task<string> GetDomainDetail(string domainName)
{
    try
    {
        var result = await _amazonRoute53Domains.GetDomainDetailAsync(
            new GetDomainDetailRequest()
            {
                DomainName = domainName
            });
        var details = $"\\tDomain {domainName}:\\n" +
                     $"\\tCreated on {result.CreationDate.ToShortDateString()}\\.\\n"
+
                     $"\\tAdmin contact is {result.AdminContact.Email}.\\n" +
                     $"\\tAuto-renew is {result.AutoRenew}.\\n";

        return details;
    }
    catch (InvalidInputException)
    {
        return $"Domain {domainName} was not found in your account.";
    }
}
```

- For API details, see [GetDomainDetail](#) in *AWS SDK for .NET API Reference*.

## Get operation details

The following code example shows how to get details on an operation.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Get details for a domain action operation.
/// </summary>
/// <param name="operationId">The operational Id.</param>
/// <returns>A string describing the operational details.</returns>
public async Task<string> GetOperationDetail(string? operationId)
{
    if (operationId == null)
        return "Unable to get operational details because ID is null.";
    try
    {
        var operationDetails =
            await _amazonRoute53Domains.GetOperationDetailAsync(
                new GetOperationDetailRequest
                {
                    OperationId = operationId
                }
            );

        var details = $"\\tOperation {operationId}:\n" +
                     $"\\tFor domain {operationDetails.DomainName} on\n" +
                     $"{operationDetails.SubmittedDate.ToShortDateString()}.\n" +
                     $"\\tMessage is {operationDetails.Message}.\n" +
                     $"\\tStatus is {operationDetails.Status}.\n";

        return details;
    }
    catch (AmazonRoute53DomainsException ex)
    {
        return $"Unable to get operation details. Here's why: {ex.Message}.";
    }
}
```

- For API details, see [GetOperationDetail](#) in *AWS SDK for .NET API Reference*.

## Get suggested domain names

The following code example shows how to get domain name suggestions.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Get a list of suggestions for a given domain.
/// </summary>
/// <param name="domain">The domain to check for suggestions.</param>
/// <param name="onlyAvailable">If true, only returns available domains.</param>
/// <param name="suggestionCount">The number of suggestions to return. Defaults to
the max of 50.</param>
/// <returns>A collection of domain suggestions.</returns>
public async Task<List<DomainSuggestion>> GetDomainSuggestions(string domain, bool
onlyAvailable, int suggestionCount = 50)
{
    var result = await _amazonRoute53Domains.GetDomainSuggestionsAsync(
        new GetDomainSuggestionsRequest
        {
            DomainName = domain,
            OnlyAvailable = onlyAvailable,
```

```
        SuggestionCount = suggestionCount
    }
}
return result.SuggestionsList;
}
```

- For API details, see [GetDomainSuggestions](#) in *AWS SDK for .NET API Reference*.

## List domain prices

The following code example shows how to list domain prices.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// List prices for domain type operations.
/// </summary>
/// <param name="domainTypes">Domain types to include in the results.</param>
/// <returns>The list of domain prices.</returns>
public async Task<List<DomainPrice>> ListPrices(List<string> domainTypes)
{
    var results = new List<DomainPrice>();
    var paginatePrices = _amazonRoute53Domains.Paginator.ListPrices(new
ListPricesRequest());
    // Get the entire list using the paginator.
    await foreach (var prices in paginatePrices.Prices)
    {
        results.Add(prices);
    }
    return results.Where(p => domainTypes.Contains(p.Name)).ToList();
}
```

- For API details, see [ListPrices](#) in *AWS SDK for .NET API Reference*.

## List domains

The following code example shows how to list the registered domains.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// List the domains for the account.
/// </summary>
/// <returns>A collection of domain summary records.</returns>
public async Task<List<DomainSummary>> ListDomains()
{
    var results = new List<DomainSummary>();
```

```
var paginateDomains = _amazonRoute53Domains.Paginator.ListDomains(  
    new ListDomainsRequest());  
  
// Get the entire list using the paginator.  
await foreach (var domain in paginateDomains.Domains)  
{  
    results.Add(domain);  
}  
return results;  
}
```

- For API details, see [ListDomains](#) in *AWS SDK for .NET API Reference*.

## List operations

The following code example shows how to list operations.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>  
/// List operations for the account that are submitted after a specified date.  
/// </summary>  
/// <returns>A collection of operation summary records.</returns>  
public async Task<List<OperationSummary>> ListOperations(DateTime submittedSince)  
{  
    var results = new List<OperationSummary>();  
    var paginateOperations = _amazonRoute53Domains.Paginator.ListOperations(  
        new ListOperationsRequest()  
    {  
        SubmittedSince = submittedSince  
    });  
  
    // Get the entire list using the paginator.  
    await foreach (var operations in paginateOperations.Operations)  
    {  
        results.Add(operations);  
    }  
    return results;  
}
```

- For API details, see [ListOperations](#) in *AWS SDK for .NET API Reference*.

## Register a domain

The following code example shows how to register a domain.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
    ///<summary>
    ///<summary> Initiate a domain registration request.
    ///</summary>
    ///<param name="contact">Contact details.</param>
    ///<param name="domainName">The domain name to register.</param>
    ///<param name="autoRenew">True if the domain should automatically renew.</param>
    ///<param name="duration">The duration in years for the domain registration.</param>
    ///<returns>The operation Id.</returns>
    public async Task<string?> RegisterDomain(string domainName, bool autoRenew, int duration, ContactDetail contact)
    {
        // This example uses the same contact information for admin, registrant, and tech contacts.
        try
        {
            var result = await _amazonRoute53Domains.RegisterDomainAsync(
                new RegisterDomainRequest()
                {
                    AdminContact = contact,
                    RegistrantContact = contact,
                    TechContact = contact,
                    DomainName = domainName,
                    AutoRenew = autoRenew,
                    DurationInYears = duration,
                    PrivacyProtectAdminContact = false,
                    PrivacyProtectRegistrantContact = false,
                    PrivacyProtectTechContact = false
                }
            );
            return result.OperationId;
        }
        catch (InvalidOperationException)
        {
            _logger.LogInformation($"Unable to request registration for domain {domainName}");
            return null;
        }
    }
}
```

- For API details, see [RegisterDomain in AWS SDK for .NET API Reference](#).

## [View billing](#)

The following code example shows how to view billing records.

### **AWS SDK for .NET**

#### **Note**

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
    ///<summary>
    ///<summary> View billing records for the account between a start and end date.
    ///</summary>
    ///<param name="startDate">The start date for billing results.</param>
    ///<param name="endDate">The end date for billing results.</param>
    ///<returns>A collection of billing records.</returns>
    public async Task<List<BillingRecord>> ViewBilling(DateTime startDate, DateTime endDate)
    {
```

```
var results = new List<BillingRecord>();
var paginateBilling = _amazonRoute53Domains.Paginator.ViewBilling(
    new ViewBillingRequest()
{
    Start = startDate,
    End = endDate
});

// Get the entire list using the paginator.
await foreach (var billingRecords in paginateBilling.BillingRecords)
{
    results.Add(billingRecords);
}
return results;
}
```

- For API details, see [ViewBilling](#) in *AWS SDK for .NET API Reference*.

## Scenarios

### Get started with domains

The following code example shows how to:

- List current domains.
- List operations in the past year.
- View billing for the account in the past year.
- View prices for domain types.
- Get domain suggestions.
- Check domain availability.
- Check domain transferability.
- Optionally, request a domain registration.
- Get an operation detail.
- Optionally, get a domain detail.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Run an interactive scenario at a command prompt.

```
public static class Route53DomainScenario
{
    /*
        Before running this .NET code example, set up your development environment,
        including your credentials.

        This .NET example performs the following tasks:
        1. List current domains.
        2. List operations in the past year.
        3. View billing for the account in the past year.
        4. View prices for domain types.
        5. Get domain suggestions.
        6. Check domain availability.
    */
}
```

```
    7. Check domain transferability.
    8. Optionally, request a domain registration.
    9. Get an operation detail.
   10. Optionally, get a domain detail.
*/

## Amazon S3 examples using AWS SDK for .NET

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for .NET with Amazon Simple Storage Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2516\)](#)
- [Scenarios \(p. 2522\)](#)

## Actions

### Copy an object from one bucket to another

The following code example shows how to copy an S3 object from one bucket to another.

#### AWS SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Copies an object in an Amazon S3 bucket to a folder within the
/// same bucket.
/// </summary>
/// <param name="client">An initialized Amazon S3 client object.</param>
/// <param name="bucketName">The name of the Amazon S3 bucket where the
/// object to copy is located.</param>
/// <param name="objectName">The object to be copied.</param>
/// <param name="folderName">The folder to which the object will
/// be copied.</param>
/// <returns>A boolean value that indicates the success or failure of
/// the copy operation.</returns>
public static async Task<bool> CopyObjectInBucketAsync(
    IAmazonS3 client,
    string bucketName,
    string objectName,
    string folderName)
{
    try
    {
        var request = new CopyObjectRequest
```

```
        {
            SourceBucket = bucketName,
            SourceKey = objectName,
            DestinationBucket = bucketName,
            DestinationKey = $"{folderName}\\{objectName}",
        };
        var response = await client.CopyObjectAsync(request);
        return response.HttpStatusCode == System.Net.HttpStatusCode.OK;
    }
    catch (AmazonS3Exception ex)
    {
        Console.WriteLine($"Error copying object: '{ex.Message}'");
        return false;
    }
}
```

    return response.HttpStatusCode == System.Net.HttpStatusCode.OK;
}
```

- For API details, see [DeleteBucket](#) in *AWS SDK for .NET API Reference*.

## Delete multiple objects

The following code example shows how to delete multiple objects from an S3 bucket.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Delete all objects in an S3 bucket.

```
/// <summary>
/// Delete all of the objects stored in an existing Amazon S3 bucket.
/// </summary>
/// <param name="client">An initialized Amazon S3 client object.</param>
/// <param name="bucketName">The name of the bucket from which the
/// contents will be deleted.</param>
/// <returns>A boolean value that represents the success or failure of
/// deleting all of the objects in the bucket.</returns>
public static async Task<bool> DeleteBucketContentsAsync(IAmazonS3 client,
string bucketName)
{
    // Iterate over the contents of the bucket and delete all objects.
```

```
var request = new ListObjectsV2Request
{
    BucketName = bucketName,
};

try
{
    var response = await client.ListObjectsV2Async(request);

    do
    {
        response.S3Objects
            .ForEach(async obj => await
client.DeleteObjectAsync(bucketName, obj.Key));

        // If the response is truncated, set the request ContinuationToken
        // from the NextContinuationToken property of the response.
        request.ContinuationToken = response.NextContinuationToken;
    }
    while (response.IsTruncated);

    return true;
}
catch (AmazonS3Exception ex)
{
    Console.WriteLine($"Error deleting objects: {ex.Message}");
    return false;
}
}
```

- For API details, see [DeleteObjects](#) in *AWS SDK for .NET API Reference*.

## Get an object from a bucket

The following code example shows how to read data from an object in an S3 bucket.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Shows how to download an object from an Amazon S3 bucket to the
/// local computer.
/// </summary>
/// <param name="client">An initialized Amazon S3 client object.</param>
/// <param name="bucketName">The name of the bucket where the object is
/// currently stored.</param>
/// <param name="objectName">The name of the object to download.</param>
/// <param name="filePath">The path, including filename, where the
/// downloaded object will be stored.</param>
/// <returns>A boolean value indicating the success or failure of the
/// download process.</returns>

## Scenarios

### Get started with buckets and objects

The following code example shows how to:

- Create a bucket.
- Upload a file to the bucket.
- Download an object from a bucket.
- Copy an object to a subfolder in a bucket.
- List the objects in a bucket.
- Delete the objects in a bucket.
- Delete a bucket.

## AWS SDK for .NET

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.IO;
using System.Threading.Tasks;
using Amazon.S3;

public class S3_Basics
{
    public static async Task Main()
    {
        // Create an Amazon S3 client object. The constructor uses the
        // default user installed on the system. To work with Amazon S3
        // features in a different AWS Region, pass the AWS Region as a
        // parameter to the client constructor.
        IAmazonS3 client = new AmazonS3Client();
```

```

## Upload or download large files

The following code example shows how to upload or download large files to and from Amazon S3.

For more information, see [Uploading an object using multipart upload](#).

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Call functions that transfer files to and from an S3 bucket using the Amazon S3 TransferUtility.

```
global using System.Text;
global using Amazon;
global using Amazon.S3;
global using Amazon.S3.Model;
global using Amazon.S3.Transfer;
global using TransferUtilityBasics;

// This Amazon S3 client uses the default user credentials
// defined for this computer.
using Microsoft.Extensions.Configuration;

IAmazonS3 client = new AmazonS3Client();
var transferUtil = new TransferUtility(client);
 IConfiguration _configuration;

_configuration = new ConfigurationBuilder()
    .SetBasePath(Directory.GetCurrentDirectory())
    .AddJsonFile("settings.json") // Load test settings from JSON file.
    .AddJsonFile("settings.local.json",
        true) // Optionally load local settings.
    .Build();

// Edit the values in settings.json to use an S3 bucket and files that
// exist on your AWS account and on the local computer where you
// run this scenario.
var bucketName = _configuration["BucketName"];
var localPath =
    $"{Environment.GetFolderPath(Environment.SpecialFolder.ApplicationData)}\TransferFolder";
```

```
DisplayInstructions();

PressEnter();

Console.WriteLine();

// Upload a single file to an S3 bucket.
DisplayTitle("Upload a single file");

var fileToUpload = _configuration["FileToUpload"];
Console.WriteLine($"Uploading {fileToUpload} to the S3 bucket, {bucketName}.`);

var success = await TransferMethods.UploadSingleFileAsync(transferUtil, bucketName,
    fileToUpload, localPath);
if (success)
{
    Console.WriteLine($"Successfully uploaded the file, {fileToUpload} to
    {bucketName}.");
}

PressEnter();

// Upload a local directory to an S3 bucket.
DisplayTitle("Upload all files from a local directory");
Console.WriteLine("Upload all the files in a local folder to an S3 bucket.");

## S3 Glacier examples using AWS SDK for .NET

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for .NET with Amazon S3 Glacier.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2531\)](#)

## Actions

### Add tags

The following code example shows how to add tags to an Amazon S3 Glacier vault.

## AWS SDK for .NET

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.Collections.Generic;
using System.Threading.Tasks;
using Amazon.Glacier;
using Amazon.Glacier.Model;

public class AddTagsToVault
{
    public static async Task Main(string[] args)
    {
        string vaultName = "example-vault";

        var client = new AmazonGlacierClient();
        var request = new AddTagsToVaultRequest
        {
            Tags = new Dictionary<string, string>
            {
                { "examplekey1", "examplevalue1" },
                { "examplekey2", "examplevalue2" },
            },
            AccountId = "-",
            VaultName = vaultName,
        };

        var response = await client.AddTagsToVaultAsync(request);
    }
}
```

- For API details, see [AddTagsToVault in AWS SDK for .NET API Reference](#).

## Create a vault

The following code example shows how to create an Amazon S3 Glacier vault.

## AWS SDK for .NET

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.Threading.Tasks;
using Amazon.Glacier;
using Amazon.Glacier.Model;

public class CreateVault
{
    static async Task Main(string[] args)
    {
        string vaultName = "example-vault";
        var client = new AmazonGlacierClient();
        var request = new CreateVaultRequest
```

```
{  
    // Setting the AccountId to "-" means that  
    // the account associated with the default  
    // client will be used.  
    AccountId = "-",  
    VaultName = vaultName,  
};  
  
var response = await client.CreateVaultAsync(request);  
  
Console.WriteLine($"Created {vaultName} at: {response.Location}");  
}  
}
```

- For API details, see [CreateVault](#) in *AWS SDK for .NET API Reference*.

## Describe a job

The following code example shows how to describe an Amazon S3 Glacier job.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;  
using System.Threading.Tasks;  
using Amazon.Glacier;  
using Amazon.Glacier.Model;  
  
public class DescribeVault  
{  
    public static async Task Main(string[] args)  
    {  
        string vaultName = "example-vault";  
        var client = new AmazonGlacierClient();  
        var request = new DescribeVaultRequest  
        {  
            AccountId = "-",  
            VaultName = vaultName,  
        };  
  
        var response = await client.DescribeVaultAsync(request);  
  
        // Display the information about the vault.  
        Console.WriteLine($"{response.VaultName}\tARN: {response.VaultARN}");  
        Console.WriteLine($"Created on: {response.CreationDate}\tNumber of  
Archives: {response.NumberOfArchives}\tSize (in bytes): {response.SizeInBytes}");  
        if (response.LastInventoryDate != DateTime.MinValue)  
        {  
            Console.WriteLine($"Last inventory: {response.LastInventoryDate}");  
        }  
    }  
}
```

## Amazon SES examples using AWS SDK for .NET

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for .NET with Amazon Simple Email Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2538\)](#)

## Actions

### Create an email template

The following code example shows how to create an Amazon SES email template.

#### AWS SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
///<summary>
/// Create an email template.
///</summary>
///<param name="name">Name of the template.</param>
///<param name="subject">Email subject.</param>
///<param name="text">Email body text.</param>
///<param name="html">Email HTML body text.</param>
///<returns>True if successful.</returns>
public async Task<bool> CreateEmailTemplateAsync(string name, string subject,
string text,
string html)
{
    var success = false;
    try
    {
        var response = await _amazonSimpleEmailService.CreateTemplateAsync(
            new CreateTemplateRequest
            {
                Template = new Template
                {
                    TemplateName = name,
                    SubjectPart = subject,
                    TextPart = text,
                    HtmlPart = html
                }
            });
        success = response.HttpStatusCode == HttpStatusCode.OK;
    }
    catch (Exception ex)
{
```

```
        Console.WriteLine("CreateEmailTemplateAsync failed with exception: " +
    ex.Message);
}

return success;
}
```

- For API details, see [CreateTemplate in AWS SDK for .NET API Reference](#).

## Delete an email template

The following code example shows how to delete an Amazon SES email template.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Delete an email template.
/// </summary>
/// <param name="templateName">Name of the template.</param>
/// <returns>True if successful.</returns>
public async Task<bool> DeleteEmailTemplateAsync(string templateName)
{
    var success = false;
    try
    {
        var response = await _amazonSimpleEmailService.DeleteTemplateAsync(
            new DeleteTemplateRequest
            {
                TemplateName = templateName
            });
        success = response.HttpStatusCode == HttpStatusCode.OK;
    }
    catch (Exception ex)
    {
        Console.WriteLine("DeleteEmailTemplateAsync failed with exception: " +
    ex.Message);
    }

    return success;
}
```

- For API details, see [DeleteTemplate in AWS SDK for .NET API Reference](#).

## Delete an identity

The following code example shows how to delete an Amazon SES identity.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Delete an email identity.
/// </summary>
/// <param name="identityEmail">The identity email to delete.</param>
/// <returns>True if successful.</returns>

## Actions

### Check whether a phone number is opted out

The following code example shows how to check whether a phone number is opted out of receiving Amazon SNS messages.

#### AWS SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.Threading.Tasks;
using Amazon.SimpleNotificationService;
using Amazon.SimpleNotificationService.Model;

///<summary>
/// This example shows how to use the Amazon Simple Notification Service
/// (Amazon SNS) to check whether a phone number has been opted out. The
/// example was created using the AWS SDK for .NET version 3.7 and
/// .NET Core 5.0.
///</summary>
public class IsPhoneNumOptedOut
{
    public static async Task Main()
    {
        string phoneNumber = "+15551112222";

        IAmazonSimpleNotificationService client = new
AmazonSimpleNotificationServiceClient();

        await CheckIfOptedOutAsync(client, phoneNumber);
    }

    ///<summary>
    /// Checks to see if the supplied phone number has been opted out.
    ///</summary>
    ///<param name="client">The initialized Amazon SNS Client object used
    /// to check if the phone number has been opted out.</param>
    ///<param name="phoneNumber">A string representing the phone number
    /// to check.</param>
    public static async Task CheckIfOptedOutAsync(IAmazonSimpleNotificationService
client, string phoneNumber)
    {
        var request = new CheckIfPhoneNumberIsOptedOutRequest
        {
            PhoneNumber = phoneNumber,
        };

        try
        {
            var response = await client.CheckIfPhoneNumberIsOptedOutAsync(request);
        }
    }
}
```

```
        if (response.StatusCode == System.Net.HttpStatusCode.OK)
    {
        string optOutStatus = response.IsOptedOut ? "opted out" : "not
opted out.";
        Console.WriteLine($"The phone number: {phoneNumber} is
{optOutStatus}");
    }
    catch (AuthorizationErrorException ex)
    {
        Console.WriteLine($"{ex.Message}");
    }
}
```

## Delete a message from a queue

The following code example shows how to delete a message from an Amazon SQS queue.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using System;
using System.Collections.Generic;
using System.Threading.Tasks;
using Amazon.SQS;
using Amazon.SQS.Model;

public class DeleteMessage
{
    /// <summary>
    /// Initializes the Amazon SQS client object. It then calls the
    /// ReceiveMessageAsync method to retrieve information about the
    /// available methods before deleting them.
    /// </summary>
    public static async Task Main()
    {
        string queueUrl = "https://sqs.us-east-2.amazonaws.com/0123456789ab/
Example_Queue";
        var attributeNames = new List<string>() { "All" };
        int maxNumberOfMessages = 5;
        var visibilityTimeout = (int)TimeSpan.FromMinutes(10).TotalSeconds;
```

```
var waitTimeSeconds = (int)TimeSpan.FromSeconds(5).TotalSeconds;

// If the Amazon SQS message queue is not in the same AWS Region as your
// default user, you need to provide the AWS Region as a parameter to the
// client constructor.
var client = new AmazonSQSClient();

var request = new ReceiveMessageRequest
{
    QueueUrl = queueUrl,
    AttributeNames = attributeNames,
    MaxNumberOfMessages = maxNumberOfMessages,
    VisibilityTimeout = visibilityTimeout,
    WaitTimeSeconds = waitTimeSeconds,
};

var response = await client.ReceiveMessageAsync(request);

if (response.Messages.Count > 0)
{
    response.Messages.ForEach(async m =>
    {
        Console.WriteLine($"Message ID: '{m.MessageId}'");

        var delRequest = new DeleteMessageRequest
        {
            QueueUrl = "https://sqs.us-east-1.amazonaws.com/0123456789ab/",
            ReceiptHandle = m.ReceiptHandle,
        };

        var delResponse = await client.DeleteMessageAsync(delRequest);
    });
}
else
{
    Console.WriteLine("No messages to delete.");
}
}
```

Receive a message from an Amazon SQS queue and then delete the message.

```
public static async Task Main()
{
    // If the AWS Region you want to use is different from
    // the AWS Region defined for the default user, supply
    // the specify your AWS Region to the client constructor.
    var client = new AmazonSQSClient();

## AWS STS examples using AWS SDK for .NET

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for .NET with AWS Security Token Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2569\)](#)

## Actions

### Assume a role

The following code example shows how to assume a role with AWS STS.

#### AWS SDK for .NET

##### Note

            var caller = await client.GetCallerIdentityAsync(callerIdRequest);
            Console.WriteLine($"Original Caller: {caller.ArN}");

            // Create the request to use with the AssumeRoleAsync call.
            var assumeRoleReq = new AssumeRoleRequest()
            {
                DurationSeconds = 1600,
                RoleSessionName = "Session1",
                RoleArn = roleArnToAssume
            };

            var assumeRoleRes = await client.AssumeRoleAsync(assumeRoleReq);

            // Now create a new client based on the credentials of the caller assuming
            the role.
        }
    }
}
```

```
        var client2 = new AmazonSecurityTokenServiceClient(credentials:  
assumeRoleRes.Credentials);  
  
        // Get and display information about the caller that has assumed the  
defined role.  
        var caller2 = await client2.GetCallerIdentityAsync(callerIdRequest);  
        Console.WriteLine($"AssumedRole Caller: {caller2.ArN}");  
    }  
}  
}
```

- For API details, see [AssumeRole](#) in [AWS SDK for .NET API Reference](#).

## Secrets Manager examples using AWS SDK for .NET

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for .NET with AWS Secrets Manager.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

## AWS Support examples using AWS SDK for .NET

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for .NET with AWS Support.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Get started

#### Hello AWS Support

The following code examples show how to get started using AWS Support.

.NET

##### AWS SDK for .NET

###### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
using Amazon AWSSupport;
using Microsoft.Extensions.DependencyInjection;
using Microsoft.Extensions.Hosting;

public static class HelloSupport
{
    static async Task Main(string[] args)
```

```
{  
    // Use the AWS .NET Core Setup package to set up dependency injection for  
    // the AWS Support service.  
    // Use your AWS profile name, or leave it blank to use the default profile.  
    // You must have one of the following AWS Support plans: Business,  
    Enterprise On-Ramp, or Enterprise. Otherwise, an exception will be thrown.  
    using var host = Host.CreateDefaultBuilder(args)  
        .ConfigureServices(_=>  
            services.AddAWSService<IAmazonAWSSupport>()  
        ).Build();  
  
    // Now the client is available for injection.  
    var supportClient = host.Services.GetRequiredService<IAmazonAWSSupport>();  
  
    // You can use await and any of the async methods to get a response.  
    var response = await supportClient.DescribeServicesAsync();  
    Console.WriteLine($"\\tHello AWS Support! There are  
{response.Services.Count} services available.");  
}  
}
```

- For API details, see [DescribeServices](#) in *AWS SDK for .NET API Reference*.

## Java

### SDK for Java 2.x

## Actions

### Add a communication to a case

The following code example shows how to add an AWS Support communication with an attachment to a support case.

#### AWS SDK for .NET

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
```

```
    /// Add communication to a case, including optional attachment set ID and CC email
    /// addresses.
    /// </summary>
    /// <param name="caseId">Id for the support case.</param>
    /// <param name="body">Body text of the communication.</param>
    /// <param name="attachmentSetId">Optional Id for an attachment set.</param>
    /// <param name="ccEmailAddresses">Optional list of CC email addresses.</param>
    /// <returns>True if successful.</returns>
    public async Task<bool> AddCommunicationToCase(string caseId, string body,
        string? attachmentSetId = null, List<string>? ccEmailAddresses = null)
    {
        var response = await _amazonSupport.AddCommunicationToCaseAsync(
            new AddCommunicationToCaseRequest()
            {
                CaseId = caseId,
                CommunicationBody = body,
                AttachmentSetId = attachmentSetId,
                CcEmailAddresses = ccEmailAddresses
            });
        return response.Result;
    }
```

- For API details, see [AddCommunicationToCase](#) in *AWS SDK for .NET API Reference*.

## Add an attachment to a set

The following code example shows how to add an AWS Support attachment to an attachment set.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
    /// <summary>
    /// Add an attachment to a set, or create a new attachment set if one does not
    /// exist.
    /// </summary>
    /// <param name="data">The data for the attachment.</param>
    /// <param name="fileName">The file name for the attachment.</param>
    /// <param name="attachmentSetId">Optional setId for the attachment. Creates a new
    /// attachment set if empty.</param>
    /// <returns>The setId of the attachment.</returns>
    public async Task<string> AddAttachmentToSet(MemoryStream data, string fileName,
        string? attachmentSetId = null)
    {
        var response = await _amazonSupport.AddAttachmentsToSetAsync(
            new AddAttachmentsToSetRequest()
            {
                AttachmentSetId = attachmentSetId,
                Attachments = new List<Attachment>()
                {
                    new Attachment
                    {
                        Data = data,
                        FileName = fileName
                    }
                }
            });
    }
```

```
        return response.AttachmentSetId;
    }
```

- For API details, see [AddAttachmentsToSet](#) in *AWS SDK for .NET API Reference*.

## Create a case

The following code example shows how to create a new AWS Support case.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
///<summary>
/// Create a new support case.
///</summary>
///<param name="serviceCode">Service code for the new case.</param>
///<param name="categoryCode">Category for the new case.</param>
///<param name="severityCode">Severity code for the new case.</param>
///<param name="subject">Subject of the new case.</param>
///<param name="body">Body text of the new case.</param>
///<param name="language">Optional language support for your case.
/// Currently "en" (English) and "ja" (Japanese) are supported.</param>
///<param name="attachmentSetId">Optional Id for an attachment set for the new
case.</param>
///<param name="issueType">Optional issue type for the new case. Options are
"customer-service" or "technical".</param>
///<returns>The caseId of the new support case.</returns>
public async Task<string> CreateCase(string serviceCode, string categoryCode,
string severityCode, string subject,
string body, string language = "en", string? attachmentSetId = null, string
issueType = "customer-service")
{
    var response = await _amazonSupport.CreateCaseAsync(
        new CreateCaseRequest()
    {
        ServiceCode = serviceCode,
        CategoryCode = categoryCode,
        SeverityCode = severityCode,
        Subject = subject,
        Language = language,
        AttachmentSetId = attachmentSetId,
        IssueType = issueType,
        CommunicationBody = body
    });
    return response.CaseId;
}
```

## Describe severity levels

The following code example shows how to describe AWS Support severity levels.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Get the descriptions of support severity levels.
/// </summary>
/// <param name="name">Optional language for severity levels.
/// Currently "en" (English) and "ja" (Japanese) are supported.</param>
/// <returns>The list of support severity levels.</returns>
public async Task<List<SeverityLevel>> DescribeSeverityLevels(string language =
"en")
{
    var response = await _amazonSupport.DescribeSeverityLevelsAsync(
        new DescribeSeverityLevelsRequest()
    {
        Language = language
    });
    return response.SeverityLevels;
}
```

- For API details, see [DescribeSeverityLevels](#) in *AWS SDK for .NET API Reference*.

## Resolve case

The following code example shows how to resolve an AWS Support case.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/// <summary>
/// Resolve a support case by caseId.
/// </summary>
/// <param name="caseId">Id for the support case.</param>
/// <returns>The final status of the case after resolving.</returns>
public async Task<string> ResolveCase(string caseId)
{
    var response = await _amazonSupport.ResolveCaseAsync(
        new ResolveCaseRequest()
    {
        CaseId = caseId
    });
    return response.FinalCaseStatus;
}
```

- For API details, see [ResolveCase](#) in *AWS SDK for .NET API Reference*.

## Scenarios

### Get started with cases

The following code example shows how to:

- Get and display available services and severity levels for cases.
- Create a support case using a selected service, category, and severity level.
- Get and display a list of open cases for the current day.
- Add an attachment set and a communication to the new case.
- Describe the new attachment and communication for the case.
- Resolve the case.
- Get and display a list of resolved cases for the current day.

### AWS SDK for .NET

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Run an interactive scenario at a command prompt.

```
/// <summary>
```

```
///> Hello AWS Support example.  
///> </summary>  
public static class SupportCaseScenario  
{  
    /*  
     * Before running this .NET code example, set up your development environment,  
     * including your credentials.  
     * To use the AWS Support API, you must have one of the following AWS Support plans:  
     * Business, Enterprise On-Ramp, or Enterprise.  
  
     * This .NET example performs the following tasks:  
     * 1. Get and display services. Select a service from the list.  
     * 2. Select a category from the selected service.

```

- For API details, see [TranslateText](#) in *AWS SDK for .NET API Reference*.

## Cross-service examples using AWS SDK for .NET

The following sample applications use the AWS SDK for .NET to work across multiple AWS services.

### Examples

- [Build a publish and subscription application that translates messages \(p. 2607\)](#)
- [Create a web application to track DynamoDB data \(p. 2607\)](#)
- [Create an Aurora Serverless work item tracker \(p. 2607\)](#)
- [Detect objects in images with Amazon Rekognition using an AWS SDK \(p. 2608\)](#)

## Build a publish and subscription application that translates messages

### AWS SDK for .NET

Shows how to use the Amazon Simple Notification Service .NET API to create a web application that has subscription and publish functionality. In addition, this example application also translates messages.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Amazon SNS
- Amazon Translate

## Create a web application to track DynamoDB data

### AWS SDK for .NET

Shows how to use the Amazon DynamoDB .NET API to create a dynamic web application that tracks DynamoDB work data.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- DynamoDB
- Amazon SES

## Create an Aurora Serverless work item tracker

### AWS SDK for .NET

Shows how to use the AWS SDK for .NET to create a web application that tracks work items in an Amazon Aurora database and emails reports by using Amazon Simple Email Service (Amazon SES). This example uses a front end built with React.js to interact with a RESTful .NET backend.

- Integrate a React web application with AWS services.
- List, add, update, and delete items in an Aurora table.
- Send an email report of filtered work items using Amazon SES.
- Deploy and manage example resources with the included AWS CloudFormation script.

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

### Services used in this example

- Aurora
- Amazon RDS
- Amazon RDS Data Service
- Amazon SES

## Detect objects in images with Amazon Rekognition using an AWS SDK

### AWS SDK for .NET

Shows how to use Amazon Rekognition .NET API to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on [GitHub](#).

#### Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

## Code examples for SDK for C++

The code examples in this topic show you how to use the AWS SDK for C++ with AWS.

### Examples

- [Single-service actions and scenarios using SDK for C++ \(p. 2608\)](#)
- [Cross-service examples using SDK for C++ \(p. 2714\)](#)

## Single-service actions and scenarios using SDK for C++

The following code examples show how to perform actions and implement common scenarios by using the AWS SDK for C++ with AWS services.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Services

- [CloudWatch examples using SDK for C++ \(p. 2609\)](#)
- [CloudWatch Logs examples using SDK for C++ \(p. 2615\)](#)
- [DynamoDB examples using SDK for C++ \(p. 2618\)](#)
- [EventBridge examples using SDK for C++ \(p. 2655\)](#)
- [IAM examples using SDK for C++ \(p. 2657\)](#)
- [Amazon S3 examples using SDK for C++ \(p. 2681\)](#)
- [Amazon SNS examples using SDK for C++ \(p. 2698\)](#)
- [AWS STS examples using SDK for C++ \(p. 2708\)](#)
- [Secrets Manager examples using SDK for C++ \(p. 2709\)](#)
- [Amazon Transcribe examples using SDK for C++ \(p. 2711\)](#)

## CloudWatch examples using SDK for C++

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for C++ with Amazon CloudWatch.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

## Actions

### Create an alarm that watches a metric

The following code example shows how to create an Amazon CloudWatch alarm that watches a metric.

#### SDK for C++

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Include the required files.

```
#include <aws/core/Aws.h>
#include <aws/monitoring/CloudWatchClient.h>
#include <aws/monitoring/model/PutMetricAlarmRequest.h>
#include <iostream>
```

Create the alarm to watch the metric.

```
Aws::CloudWatch::CloudWatchClient cw;
Aws::CloudWatch::Model::PutMetricAlarmRequest request;
request.SetAlarmName(alarm_name);
request.SetComparisonOperator(
    Aws::CloudWatch::Model::ComparisonOperator::GreaterThanThreshold);
request.SetEvaluationPeriods(1);
request.SetMetricName("CPUUtilization");
request.SetNamespace("AWS/EC2");
request.SetPeriod(60);
request.SetStatistic(Aws::CloudWatch::Model::Statistic::Average);
request.SetThreshold(70.0);
request.SetActionsEnabled(false);
request.SetAlarmDescription("Alarm when server CPU exceeds 70%");
request.SetUnit(Aws::CloudWatch::Model::StandardUnit::Seconds);

Aws::CloudWatch::Model::Dimension dimension;
dimension.SetName("InstanceId");
dimension.SetValue(instanceId);

request.AddDimensions(dimension);

auto outcome = cw.PutMetricAlarm(request);
if (!outcome.IsSuccess())
{
    std::cout << "Failed to create CloudWatch alarm:" <<
        outcome.GetError().GetMessage() << std::endl;
```

```
        }
    else
    {
        std::cout << "Successfully created CloudWatch alarm " << alarm_name
                << std::endl;
    }
}
```

- For API details, see [PutMetricAlarm in AWS SDK for C++ API Reference](#).

## Delete alarms

The following code example shows how to delete Amazon CloudWatch alarms.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Include the required files.

```
#include <aws/core/Aws.h>
#include <aws/monitoring/CloudWatchClient.h>
#include <aws/monitoring/model/DeleteAlarmsRequest.h>
#include <iostream>
```

Delete the alarm.

```
Aws::CloudWatch::CloudWatchClient cw;
Aws::CloudWatch::Model::DeleteAlarmsRequest request;
request.AddAlarmNames(alarm_name);

auto outcome = cw.DeleteAlarms(request);
if (!outcome.IsSuccess())
{
    std::cout << "Failed to delete CloudWatch alarm:" <<
                outcome.GetError().GetMessage() << std::endl;
}
else
{
    std::cout << "Successfully deleted CloudWatch alarm " << alarm_name
                << std::endl;
}
```

- For API details, see [DeleteAlarms in AWS SDK for C++ API Reference](#).

## Describe alarms for a metric

The following code example shows how to describe Amazon CloudWatch alarms for a metric.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Include the required files.

```
#include <aws/core/Aws.h>
#include <aws/monitoring/CloudWatchClient.h>
#include <aws/monitoring/model/DescribeAlarmsRequest.h>
#include <aws/monitoring/model/DescribeAlarmsResult.h>
#include <iomanip>
#include <iostream>
```

Describe the alarms.

```
Aws::CloudWatch::CloudWatchClient cw;
Aws::CloudWatch::Model::DescribeAlarmsRequest request;
request.SetMaxRecords(1);

bool done = false;
bool header = false;
while (!done)
{
    auto outcome = cw.DescribeAlarms(request);
    if (!outcome.IsSuccess())
    {
        std::cout << "Failed to describe CloudWatch alarms:" <<
            outcome.GetError().GetMessage() << std::endl;
        break;
    }

    if (!header)
    {
        std::cout << std::left <<
            std::setw(32) << "Name" <<
            std::setw(64) << "Arn" <<
            std::setw(64) << "Description" <<
            std::setw(20) << "LastUpdated" <<
            std::endl;
        header = true;
    }

    const auto &alarms = outcome.GetResult().GetMetricAlarms();
    for (const auto &alarm : alarms)
    {
        std::cout << std::left <<
            std::setw(32) << alarm.GetAlarmName() <<
            std::setw(64) << alarm.GetAlarmArn() <<
            std::setw(64) << alarm.GetAlarmDescription() <<
            std::setw(20) <<
            alarm.GetAlarmConfigurationUpdatedTimestamp().ToGmtString(
                SIMPLE_DATE_FORMAT_STR) <<
            std::endl;
    }

    const auto &next_token = outcome.GetResult().GetNextToken();
    request.SetNextToken(next_token);
    done = next_token.empty();
}
```

- For API details, see [DescribeAlarmsForMetric](#) in *AWS SDK for C++ API Reference*.

### Disable alarm actions

The following code example shows how to disable Amazon CloudWatch alarm actions.

## SDK for C++

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Include the required files.

```
#include <aws/core/Aws.h>
#include <aws/monitoring/CloudWatchClient.h>
#include <aws/monitoring/model/DisableAlarmActionsRequest.h>
#include <iostream>
```

Disable the alarm actions.

```
Aws::CloudWatch::CloudWatchClient cw;

Aws::CloudWatch::Model::DisableAlarmActionsRequest disableAlarmActionsRequest;
disableAlarmActionsRequest.AddAlarmNames(alarm_name);

auto disableAlarmActionsOutcome =
cw.DisableAlarmActions(disableAlarmActionsRequest);
if (!disableAlarmActionsOutcome.IsSuccess())
{
    std::cout << "Failed to disable actions for alarm " << alarm_name <<
        ":" << disableAlarmActionsOutcome.GetError().GetMessage() <<
        std::endl;
}
else
{
    std::cout << "Successfully disabled actions for alarm " <<
        alarm_name << std::endl;
}
```

- For API details, see [DisableAlarmActions](#) in *AWS SDK for C++ API Reference*.

## Enable alarm actions

The following code example shows how to enable Amazon CloudWatch alarm actions.

## SDK for C++

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Include the required files.

```
#include <aws/core/Aws.h>
#include <aws/monitoring/CloudWatchClient.h>
#include <aws/monitoring/model/EnableAlarmActionsRequest.h>
#include <aws/monitoring/model/PutMetricAlarmRequest.h>
#include <iostream>
```

Enable the alarm actions.

```
Aws::CloudWatch::CloudWatchClient cw;
```

```
Aws::CloudWatch::Model::PutMetricAlarmRequest request;
request.SetAlarmName(alarm_name);
request.SetComparisonOperator(
    Aws::CloudWatch::Model::ComparisonOperator::GreaterThanOrEqualToThreshold);
request.SetEvaluationPeriods(1);
request.SetMetricName("CPUUtilization");
request.SetNamespace("AWS/EC2");
request.SetPeriod(60);
request.SetStatistic(Aws::CloudWatch::Model::Statistic::Average);
request.SetThreshold(70.0);
request.SetActionsEnabled(false);
request.SetAlarmDescription("Alarm when server CPU exceeds 70%");
request.SetUnit(Aws::CloudWatch::Model::StandardUnit::Seconds);
request.AddAlarmActions(actionArn);

Aws::CloudWatch::Model::Dimension dimension;
dimension.SetName("InstanceId");
dimension.SetValue(instanceId);
request.AddDimensions(dimension);

auto outcome = cw.PutMetricAlarm(request);
if (!outcome.IsSuccess())
{
    std::cout << "Failed to create CloudWatch alarm:" <<
        outcome.GetError().GetMessage() << std::endl;
    return;
}

Aws::CloudWatch::Model::EnableAlarmActionsRequest enable_request;
enable_request.AddAlarmNames(alarm_name);

auto enable_outcome = cw.EnableAlarmActions(enable_request);
if (!enable_outcome.IsSuccess())
{
    std::cout << "Failed to enable alarm actions:" <<
        enable_outcome.GetError().GetMessage() << std::endl;
    return;
}

std::cout << "Successfully created alarm " << alarm_name <<
    " and enabled actions on it." << std::endl;
```

- For API details, see [EnableAlarmActions](#) in *AWS SDK for C++ API Reference*.

## List metrics

The following code example shows how to list Amazon CloudWatch metrics.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Include the required files.

```
#include <aws/core/Aws.h>
#include <aws/monitoring/CloudWatchClient.h>
#include <aws/monitoring/model/ListMetricsRequest.h>
#include <aws/monitoring/model/ListMetricsResult.h>
#include <iomanip>
#include <iostream>
```

List the metrics.

```
Aws::CloudWatch::CloudWatchClient cw;
Aws::CloudWatch::Model::ListMetricsRequest request;

if (argc > 1)
{
    request.SetMetricName(argv[1]);
}

if (argc > 2)
{
    request.SetNamespace(argv[2]);
}

bool done = false;
bool header = false;
while (!done)
{
    auto outcome = cw.ListMetrics(request);
    if (!outcome.IsSuccess())
    {
        std::cout << "Failed to list CloudWatch metrics:" <<
                    outcome.GetError().GetMessage() << std::endl;
        break;
    }

    if (!header)
    {
        std::cout << std::left << std::setw(48) << "MetricName" <<
                    std::setw(32) << "Namespace" << "DimensionNameValuePair" <<
                    std::endl;
        header = true;
    }

    const auto &metrics = outcome.GetResult().GetMetrics();
    for (const auto &metric : metrics)
    {
        std::cout << std::left << std::setw(48) <<
                    metric.GetMetricName() << std::setw(32) <<
                    metric.GetNamespace();
        const auto &dimensions = metric.GetDimensions();
        for (auto iter = dimensions.cbegin();  

                iter != dimensions.cend(); ++iter)
        {
            const auto &dimkv = *iter;
            std::cout << dimkv.GetName() << " = " << dimkv.GetValue();
            if (iter + 1 != dimensions.cend())
            {
                std::cout << ", ";
            }
        }
        std::cout << std::endl;
    }

    const auto &next_token = outcome.GetResult().GetNextToken();
    request.SetNextToken(next_token);
    done = next_token.empty();
}
```

- For API details, see [ListMetrics](#) in *AWS SDK for C++ API Reference*.

## Put data into a metric

The following code example shows how to put data into a Amazon CloudWatch metric.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Include the required files.

```
#include <aws/core/Aws.h>
#include <aws/monitoring/CloudWatchClient.h>
#include <aws/monitoring/model/PutMetricDataRequest.h>
#include <iostream>
```

Put data into the metric.

```
Aws::CloudWatch::CloudWatchClient cw;

Aws::CloudWatch::Model::Dimension dimension;
dimension.SetName("UNIQUE_PAGES");
dimension.SetValue("URLS");

Aws::CloudWatch::Model::MetricDatum datum;
datum.SetMetricName("PAGES_VISITED");
datum.SetUnit(Aws::CloudWatch::Model::StandardUnit::None);
datum.SetValue(data_point);
datum.AddDimensions(dimension);

Aws::CloudWatch::Model::PutMetricDataRequest request;
request.SetNamespace("SITE/TRAFFIC");
request.AddMetricData(datum);

auto outcome = cw.PutMetricData(request);
if (!outcome.IsSuccess())
{
    std::cout << "Failed to put sample metric data:" <<
        outcome.GetError().GetMessage() << std::endl;
}
else
{
    std::cout << "Successfully put sample metric data" << std::endl;
}
```

- For API details, see [PutMetricData](#) in *AWS SDK for C++ API Reference*.

## CloudWatch Logs examples using SDK for C++

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for C++ with Amazon CloudWatch Logs.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2616\)](#)

## Actions

### Create a subscription filter

The following code example shows how to create an Amazon CloudWatch Logs subscription filter.

#### SDK for C++

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Include the required files.

```
#include <aws/core/Aws.h>
#include <aws/logs/CloudWatchLogsClient.h>
#include <aws/logs/model/PutSubscriptionFilterRequest.h>
#include <aws/core/utils/Outcome.h>
#include <iostream>
```

Create the subscription filter.

```
Aws::CloudWatchLogs::CloudWatchLogsClient cwl;
Aws::CloudWatchLogs::Model::PutSubscriptionFilterRequest request;
request.SetFilterName(filter_name);
request.SetFilterPattern(filter_pattern);
request.SetLogGroupName(log_group);
request.SetDestinationArn(dest_arn);
auto outcome = cwl.PutSubscriptionFilter(request);
if (!outcome.IsSuccess())
{
    std::cout << "Failed to create CloudWatch logs subscription filter "
        << filter_name << ":" << outcome.GetError().GetMessage() <<
        std::endl;
}
else
{
    std::cout << "Successfully created CloudWatch logs subscription " <<
        "filter " << filter_name << std::endl;
}
```

- For API details, see [PutSubscriptionFilter](#) in [AWS SDK for C++ API Reference](#).

### Delete a subscription filter

The following code example shows how to delete an Amazon CloudWatch Logs subscription filter.

#### SDK for C++

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Include the required files.

```
#include <aws/core/Aws.h>
#include <aws/core/utils/Outcome.h>
#include <aws/logs/CloudWatchLogsClient.h>
#include <aws/logs/model/DeleteSubscriptionFilterRequest.h>
#include <iostream>
```

Delete the subscription filter.

```
Aws::CloudWatchLogs::CloudWatchLogsClient cwl;
Aws::CloudWatchLogs::Model::DeleteSubscriptionFilterRequest request;
request.SetFilterName(filter_name);
request.SetLogGroupName(log_group);

auto outcome = cwl.DeleteSubscriptionFilter(request);
if (!outcome.IsSuccess()) {
    std::cout << "Failed to delete CloudWatch log subscription filter "
        << filter_name << ":" << outcome.GetError().GetMessage() <<
        std::endl;
} else {
    std::cout << "Successfully deleted CloudWatch logs subscription " <<
        "filter " << filter_name << std::endl;
}
```

- For API details, see [DeleteSubscriptionFilter](#) in *AWS SDK for C++ API Reference*.

## Describe existing subscription filters

The following code example shows how to describe Amazon CloudWatch Logs existing subscription filters.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Include the required files.

```
#include <aws/core/Aws.h>

## DynamoDB examples using SDK for C++

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for C++ with Amazon DynamoDB.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2618\)](#)
- [Scenarios \(p. 2632\)](#)

## Actions

### Create a table

The following code example shows how to create a DynamoDB table.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
Aws::Client::ClientConfiguration clientConfig;
if (!region.empty())
```

```
    clientConfig.region = region;
Aws::DynamoDB::DynamoDBClient dynamoClient(clientConfig);

std::cout << "Creating table " << table <<
    " with a simple primary key: \"Name\"" << std::endl;

Aws::DynamoDB::Model::CreateTableRequest req;

Aws::DynamoDB::Model::AttributeDefinition haskKey;
haskKey.SetAttributeName("Name");
haskKey.SetAttributeType(Aws::DynamoDB::Model::ScalarAttributeType::S);
req.AddAttributeDefinitions(haskKey);

Aws::DynamoDB::Model::KeySchemaElement keyselt;

keyselt.WithAttributeName("Name").WithKeyType(Aws::DynamoDB::Model::KeyType::HASH);
req.AddKeySchema(keyselt);

Aws::DynamoDB::Model::ProvisionedThroughput thruput;
thruput.WithReadCapacityUnits(5).WithWriteCapacityUnits(5);
req.SetProvisionedThroughput(thruput);
req.SetTableName(table);

const Aws::DynamoDB::Model::CreateTableOutcome& result =
dynamoClient.CreateTable(req);
if (result.IsSuccess())
{
    std::cout << "Table \\" <<
result.GetResult().GetTableDescription().GetTableName() <<
        " created!" << std::endl;
}
else
{
    std::cout << "Failed to create table: " << result.GetError().GetMessage();
}
```

- For API details, see [CreateTable](#) in *AWS SDK for C++ API Reference*.

## Delete a table

The following code example shows how to delete a DynamoDB table.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
Aws::Client::ClientConfiguration clientConfig;
if (!region.empty())
    clientConfig.region = region;
Aws::DynamoDB::DynamoDBClient dynamoClient(clientConfig);

Aws::DynamoDB::Model::DeleteTableRequest dtr;
dtr.SetTableName(table);

const Aws::DynamoDB::Model::DeleteTableOutcome& result =
dynamoClient.DeleteTable(dtr);
if (result.IsSuccess())
{
    std::cout << "Your Table \\" <<
result.GetResult().GetTableDescription().GetTableName() << " was deleted!\n";
```

```
        }
    else
    {
        std::cout << "Failed to delete table: " << result.GetError().GetMessage();
    }
}
```

- For API details, see [DeleteTable](#) in *AWS SDK for C++ API Reference*.

## Get an item from a table

The following code example shows how to get an item from a DynamoDB table.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
Aws::Client::ClientConfiguration clientConfig;
Aws::DynamoDB::DynamoDBClient dynamoClient(clientConfig);
Aws::DynamoDB::Model::GetItemRequest req;

// Set up the request.
req.SetTableName(table);
Aws::DynamoDB::Model::AttributeValue hashKey;
hashKey.SetS(keyval);
req.AddKey(key, hashKey);

// Retrieve the item's fields and values
const Aws::DynamoDB::Model::GetItemOutcome& result = dynamoClient.GetItem(req);
if (result.IsSuccess())
{
    // Reference the retrieved fields/values.
    const Aws::Map<Aws::String, Aws::DynamoDB::Model::AttributeValue>& item =
result.GetResult().GetItem();
    if (item.size() > 0)
    {
        // Output each retrieved field and its value.
        for (const auto& i : item)
            std::cout << "Values: " << i.first << ":" << i.second.GetS() <<
std::endl;
    }
    else
    {
        std::cout << "No item found with the key " << key << std::endl;
    }
}
else
{
    std::cout << "Failed to get item: " << result.GetError().GetMessage();
}
```

- For API details, see [GetItem](#) in *AWS SDK for C++ API Reference*.

## Get information about a table

The following code example shows how to get information about a DynamoDB table.

## SDK for C++

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
Aws::Client::ClientConfiguration clientConfig;
if (!region.empty())
    clientConfig.region = region;
Aws::DynamoDB::DynamoDBClient dynamoClient(clientConfig);

Aws::DynamoDB::Model::DescribeTableRequest dtr;
dtr.SetTableName(table);

const Aws::DynamoDB::Model::DescribeTableOutcome& result =
dynamoClient.DescribeTable(dtr);

if (result.IsSuccess())
{
    const Aws::DynamoDB::Model::TableDescription& td =
result.GetResult().GetTable();
    std::cout << "Table name : " << td.GetTableName() << std::endl;
    std::cout << "Table ARN : " << td.GetTableArn() << std::endl;
    std::cout << "Status : " <<
Aws::DynamoDB::Model::TableStatusMapper::GetNameForTableStatus(td.GetTableStatus()) <<
std::endl;
    std::cout << "Item count : " << td.GetItemCount() << std::endl;
    std::cout << "Size (bytes): " << td.GetTableSizeBytes() << std::endl;

    const Aws::DynamoDB::Model::ProvisionedThroughputDescription& ptd =
td.GetProvisionedThroughput();
    std::cout << "Throughput" << std::endl;
    std::cout << " Read Capacity : " << ptd.GetReadCapacityUnits() <<
std::endl;
    std::cout << " Write Capacity: " << ptd.GetWriteCapacityUnits() <<
std::endl;

    const Aws::Vector<Aws::DynamoDB::Model::AttributeDefinition>& ad =
td.GetAttributeDefinitions();
    std::cout << "Attributes" << std::endl;
    for (const auto& a : ad)
        std::cout << " " << a.getAttributeName() << "(" <<

Aws::DynamoDB::Model::ScalarAttributeTypeMapper::GetNameForScalarAttributeType(a.getAttributeType()
<<
")" << std::endl;
}
else
{
    std::cout << "Failed to describe table: " <<
result.GetError().GetMessage();
}
```

- For API details, see [DescribeTable](#) in *AWS SDK for C++ API Reference*.

## List tables

The following code example shows how to list DynamoDB tables.

## SDK for C++

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
Aws::Client::ClientConfiguration clientConfig;
Aws::DynamoDB::DynamoDBClient dynamoClient(clientConfig);

Aws::DynamoDB::Model::ListTablesRequest listTablesRequest;
listTablesRequest.SetLimit(50);
do
{
    const Aws::DynamoDB::Model::ListTablesOutcome& lto =
dynamoClient.ListTables(listTablesRequest);
    if (!lto.IsSuccess())
    {
        std::cout << "Error: " << lto.GetError().GetMessage() << std::endl;
        return 1;
    }

    for (const auto& s : lto.GetResult().GetTableNames())
        std::cout << s << std::endl;

listTablesRequest.SetExclusiveStartTableName(lto.GetResult().GetLastEvaluatedTableName());
} while (!listTablesRequest.GetExclusiveStartTableName().empty());
```

- For API details, see [ListTables](#) in *AWS SDK for C++ API Reference*.

## Put an item in a table

The following code example shows how to put an item in a DynamoDB table.

## SDK for C++

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
Aws::Client::ClientConfiguration clientConfig;
Aws::DynamoDB::DynamoDBClient dynamoClient(clientConfig);

Aws::DynamoDB::Model::PutItemRequest putItemRequest;
putItemRequest.SetTableName(table);

Aws::DynamoDB::Model::AttributeValue av;
av.SetS(keyVal);

Aws::DynamoDB::Model::AttributeValue album;
album.SetS(AlbumTitleValue);

Aws::DynamoDB::Model::AttributeValue awards;
awards.SetS(AwardVal);

Aws::DynamoDB::Model::AttributeValue song;
song.SetS(SongTitleVal);

// Add all AttributeValue objects.
```

```
putItemRequest.AddItem(key, av);
putItemRequest.AddItem(albumTitle, album);
putItemRequest.AddItem(Awards, awards);
putItemRequest.AddItem(SongTitle, song);

const Aws::DynamoDB::Model::PutItemOutcome result =
dynamoClient.PutItem(putItemRequest);
if (!result.IsSuccess())
{
    std::cout << result.GetError().GetMessage() << std::endl;
    return 1;
}
std::cout << "Successfully added Item!" << std::endl;
```

- For API details, see [PutItem](#) in *AWS SDK for C++ API Reference*.

## Query a table

The following code example shows how to query a DynamoDB table.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
Aws::Client::ClientConfiguration clientConfig;

Aws::DynamoDB::DynamoDBClient dynamoClient(clientConfig);
Aws::DynamoDB::Model::QueryRequest req;

req.SetTableName(table);

// Set query key condition expression
req.SetKeyConditionExpression(partitionKeyAttributeName + "= :valueToMatch");

// Set Expression AttributeValues
Aws::Map<Aws::String, Aws::DynamoDB::Model::AttributeValue> attributeValues;
attributeValues.emplace(":valueToMatch", partitionKeyValue);

req.SetExpressionAttributeValues(attributeValues);

// Perform Query operation
const Aws::DynamoDB::Model::QueryOutcome& result = dynamoClient.Query(req);
if (result.IsSuccess())
{
    // Reference the retrieved items
    const Aws::Vector<Aws::Map<Aws::String,
Aws::DynamoDB::Model::AttributeValue>>& items = result.GetResult().GetItems();
    if(items.size() > 0)
    {
        std::cout << "Number of items retrieved from Query: " << items.size()
<< std::endl;
        //Iterate each item and print
        for(const auto &item: items)
        {
            std::cout << "*****";
        }
        std::cout << std::endl;
        // Output each retrieved field and its value
        for (const auto& i : item)
            std::cout << i.first << ":" << i.second.GetS() << std::endl;
    }
}
```

```
        }
    }

    else
    {
        std::cout << "No item found in table: " << table << std::endl;
    }
else
{
    std::cout << "Failed to Query items: " << result.GetError().GetMessage();
}
```

- For API details, see [Query in AWS SDK for C++ API Reference](#).

## Run a PartiQL statement

The following code example shows how to run a PartiQL statement on a DynamoDB table.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Use an INSERT statement to add an item.

```
Aws::DynamoDB::DynamoDBClient dynamoClient(clientConfiguration);

// 2. Add a new movie using an "Insert" statement. (ExecuteStatement)
Aws::String title;
float rating;
int year;
Aws::String plot;
{
    title = askQuestion(
        "Enter the title of a movie you want to add to the table: ");
    year = askQuestionForInt("What year was it released? ");
    rating = askQuestionForFloatRange("On a scale of 1 - 10, how do you rate it? ",
        1, 10);
    plot = askQuestion("Summarize the plot for me: ");

    Aws::DynamoDB::Model::ExecuteStatementRequest request;
    std::stringstream sqlStream;
    sqlStream << "INSERT INTO \"<< MOVIE_TABLE_NAME << \" VALUE {"
        << TITLE_KEY << ": ?, \" << YEAR_KEY << ": ?, "
        << INFO_KEY << ": ?}";

    request.SetStatement(sqlStream.str());

    // Create the parameter attributes.
    Aws::Vector<Aws::DynamoDB::Model::AttributeValue> attributes;
    attributes.push_back(Aws::DynamoDB::Model::AttributeValue().SetS(title));
    attributes.push_back(Aws::DynamoDB::Model::AttributeValue().SetN(year));

    Aws::DynamoDB::Model::AttributeValue infoMapAttribute;

    std::shared_ptr<Aws::DynamoDB::Model::AttributeValue> ratingAttribute =
    Aws::MakeShared<Aws::DynamoDB::Model::AttributeValue>(
        ALLOCATION_TAG.c_str());
    ratingAttribute->SetN(rating);
    infoMapAttribute.AddMEEntry(RATING_KEY, ratingAttribute);
```

```
    std::shared_ptr<Aws::DynamoDB::Model::AttributeValue> plotAttribute =
Aws::MakeShared<Aws::DynamoDB::Model::AttributeValue>(
    ALLOCATION_TAG.c_str());
plotAttribute->SetS(plot);
infoMapAttribute.AddMEntry(PLOT_KEY, plotAttribute);
attributes.push_back(infoMapAttribute);
request.SetParameters(attributes);

    Aws::DynamoDB::Model::ExecuteStatementOutcome outcome =
dynamoClient.ExecuteStatement(
    request);

    if (!outcome.IsSuccess()) {
        std::cerr << "Failed to add a movie: " << outcome.GetError().GetMessage()
            << std::endl;
        return false;
    }
}
```

Use a SELECT statement to get an item.

```
// 3. Get the data for the movie using a "Select" statement. (ExecuteStatement)
{
    Aws::DynamoDB::Model::ExecuteStatementRequest request;
    std::stringstream sqlStream;
    sqlStream << "SELECT * FROM \\" " << MOVIE_TABLE_NAME << "\\ WHERE "
        << TITLE_KEY << "=? and " << YEAR_KEY << "=?";

    request.SetStatement(sqlStream.str());

    Aws::Vector<Aws::DynamoDB::Model::AttributeValue> attributes;
    attributes.push_back(Aws::DynamoDB::Model::AttributeValue().SetS(title));
    attributes.push_back(Aws::DynamoDB::Model::AttributeValue().SetN(year));
    request.SetParameters(attributes);

    Aws::DynamoDB::Model::ExecuteStatementOutcome outcome =
dynamoClient.ExecuteStatement(
    request);

    if (!outcome.IsSuccess()) {
        std::cerr << "Failed to retrieve movie information: "
            << outcome.GetError().GetMessage() << std::endl;
        return false;
    }
    else {
        // Print the retrieved movie information.
        const Aws::DynamoDB::Model::ExecuteStatementResult &result =
outcome.GetResult();

        const Aws::Vector<Aws::Map<Aws::String,
Aws::DynamoDB::Model::AttributeValue>> &items = result.GetItems();

        if (items.size() == 1) {
            printMovieInfo(items[0]);
        }
        else {
            std::cerr << "Error: " << items.size() << " movies were retrieved. "
                << " There should be only one movie." << std::endl;
        }
    }
}
```

Use an UPDATE statement to update an item.

```
// 4. Update the data for the movie using an "Update" statement.  
(ExecuteStatement)  
{  
    rating = askQuestionForFloatRange(  
        Aws::String("\nLet's update your movie.\nYou rated it  ") +  
        std::to_string(rating)  
        + ", what new rating would you give it? ", 1, 10);  
  
    Aws::DynamoDB::Model::ExecuteStatementRequest request;  
    std::stringstream sqlStream;  
    sqlStream << "UPDATE \"<< MOVIE_TABLE_NAME << \" SET "  
    << INFO_KEY << "." << RATING_KEY << "=? WHERE "  
    << TITLE_KEY << "=? AND " << YEAR_KEY << "=?";  
  
    request.SetStatement(sqlStream.str());  
  
    Aws::Vector<Aws::DynamoDB::Model::AttributeValue> attributes;  
    attributes.push_back(Aws::DynamoDB::Model::AttributeValue().SetN(rating));  
    attributes.push_back(Aws::DynamoDB::Model::AttributeValue().SetS(title));  
    attributes.push_back(Aws::DynamoDB::Model::AttributeValue().SetN(year));  
  
    request.SetParameters(attributes);  
  
    Aws::DynamoDB::Model::ExecuteStatementOutcome outcome =  
    dynamoClient.ExecuteStatement(  
        request);  
  
    if (!outcome.IsSuccess()) {  
        std::cerr << "Failed to update a movie: "  
        << outcome.GetError().GetMessage();  
        return false;  
    }  
}
```

Use a DELETE statement to delete an item.

```
// 6. Delete the movie using a "Delete" statement. (ExecuteStatement)  
{  
    Aws::DynamoDB::Model::ExecuteStatementRequest request;  
    std::stringstream sqlStream;  
    sqlStream << "DELETE FROM \"<< MOVIE_TABLE_NAME << \" WHERE "  
    << TITLE_KEY << "=? and " << YEAR_KEY << "=?";  
  
    request.SetStatement(sqlStream.str());  
  
    Aws::Vector<Aws::DynamoDB::Model::AttributeValue> attributes;  
    attributes.push_back(Aws::DynamoDB::Model::AttributeValue().SetS(title));  
    attributes.push_back(Aws::DynamoDB::Model::AttributeValue().SetN(year));  
    request.SetParameters(attributes);  
  
    Aws::DynamoDB::Model::ExecuteStatementOutcome outcome =  
    dynamoClient.ExecuteStatement(  
        request);  
    if (!outcome.IsSuccess()) {  
        std::cerr << "Failed to delete the movie: "  
        << outcome.GetError().GetMessage() << std::endl;  
        return false;  
    }  
}
```

- For API details, see [ExecuteStatement](#) in *AWS SDK for C++ API Reference*.

## Run batches of PartiQL statements

The following code example shows how to run batches of PartiQL statements on a DynamoDB table.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Use batches of INSERT statements to add items.

```
// 2. Add multiple movies using "Insert" statements. (BatchExecuteStatement)
Aws::DynamoDB::DynamoDBClient dynamoClient(clientConfiguration);

std::vector<Aws::String> titles;
std::vector<float> ratings;
std::vector<int> years;
std::vector<Aws::String> plots;
Aws::String doAgain = "n";
do {
    Aws::String aTitle = askQuestion(
        "Enter the title of a movie you want to add to the table: ");
    titles.push_back(aTitle);
    int aYear = askQuestionForInt("What year was it released? ");
    years.push_back(aYear);
    float aRating = askQuestionForFloatRange(
        "On a scale of 1 - 10, how do you rate it? ",
        1, 10);
    ratings.push_back(aRating);
    Aws::String aPlot = askQuestion("Summarize the plot for me: ");
    plots.push_back(aPlot);

    doAgain = askQuestion(Aws::String("Would you like to add more movies? (y/n)"));
} while (doAgain == "y");

std::cout << "Adding " << titles.size()
    << (titles.size() == 1 ? " movie " : " movies ")
    << "to the table using a batch \"INSERT\" statement." << std::endl;

{
    Aws::Vector<Aws::DynamoDB::Model::BatchStatementRequest> statements(
        titles.size());

    std::stringstream sqlStream;
    sqlStream << "INSERT INTO \"" << MOVIE_TABLE_NAME << "\" VALUE {"
        << TITLE_KEY << ": ?, " << YEAR_KEY << ": ?, "
        << INFO_KEY << ": ?}";

    std::string sql(sqlStream.str());

    for (size_t i = 0; i < statements.size(); ++i) {
        statements[i].SetStatement(sql);

        Aws::Vector<Aws::DynamoDB::Model::AttributeValue> attributes;
        attributes.push_back(
            Aws::DynamoDB::Model::AttributeValue().SetS(titles[i]));

        attributes.push_back(Aws::DynamoDB::Model::AttributeValue().SetN(years[i]));

        // Create attribute for the info map.
```

```

Aws::DynamoDB::Model::AttributeValue infoMapAttribute;

    std::shared_ptr<Aws::DynamoDB::Model::AttributeValue> ratingAttribute =
Aws::MakeShared<Aws::DynamoDB::Model::AttributeValue>(
        ALLOCATION_TAG.c_str());
    ratingAttribute->SetN(ratings[i]);
    infoMapAttribute.AddMEntry(RATING_KEY, ratingAttribute);

    std::shared_ptr<Aws::DynamoDB::Model::AttributeValue> plotAttribute =
Aws::MakeShared<Aws::DynamoDB::Model::AttributeValue>(
        ALLOCATION_TAG.c_str());
    plotAttribute->SetS(plots[i]);
    infoMapAttribute.AddMEntry(PLOT_KEY, plotAttribute);
    attributes.push_back(infoMapAttribute);
    statements[i].SetParameters(attributes);
}

Aws::DynamoDB::Model::BatchExecuteStatementRequest request;
request.SetStatements(statements);

Aws::DynamoDB::Model::BatchExecuteStatementOutcome outcome =
dynamoClient.BatchExecuteStatement(
    request);
if (!outcome.IsSuccess()) {
    std::cerr << "Failed to add the movies: " <<
outcome.GetError().GetMessage()
        << std::endl;
    return false;
}
}

```

```
// 3. Get the data for multiple movies using "Select" statements.
(BatchExecuteStatement)
{
    Aws::Vector<Aws::DynamoDB::Model::BatchStatementRequest> statements(
        titles.size());
    std::stringstream sqlStream;
    sqlStream << "SELECT * FROM `"
        << MOVIE_TABLE_NAME << "` WHERE "
        << TITLE_KEY << "=?" and " << YEAR_KEY << "=?";

    std::string sql(sqlStream.str());

    for (size_t i = 0; i < statements.size(); ++i) {
        statements[i].SetStatement(sql);
        Aws::Vector<Aws::DynamoDB::Model::AttributeValue> attributes;
        attributes.push_back(
            Aws::DynamoDB::Model::AttributeValue().SetS(titles[i]));

        attributes.push_back(Aws::DynamoDB::Model::AttributeValue().SetN(years[i]));
        statements[i].SetParameters(attributes);
    }

    Aws::DynamoDB::Model::BatchExecuteStatementRequest request;
    request.SetStatements(statements);

    Aws::DynamoDB::Model::BatchExecuteStatementOutcome outcome =
dynamoClient.BatchExecuteStatement(
        request);
    if (outcome.IsSuccess()) {
```

```
    const Aws::DynamoDB::Model::BatchExecuteStatementResult &result =
outcome.GetResult();

    const Aws::Vector<Aws::DynamoDB::Model::BatchStatementResponse> &responses
= result.GetResponses();

    for (const Aws::DynamoDB::Model::BatchStatementResponse &response:
responses) {
        const Aws::Map<Aws::String, Aws::DynamoDB::Model::AttributeValue> &item
= response.GetItem();

        printMovieInfo(item);
    }
} else {
    std::cerr << "Failed to retrieve the movie information: "
        << outcome.GetError().GetMessage() << std::endl;
    return false;
}
}
```

Use batches of UPDATE statements to update items.

```
// 4. Update the data for multiple movies using "Update" statements.
(BatchExecuteStatement)

for (size_t i = 0; i < titles.size(); ++i) {
    ratings[i] = askQuestionForFloatRange(
        Aws::String("\nLet's update your the movie, \"") + titles[i] +
        ".\nYou rated it " + std::to_string(ratings[i]) +
        ", what new rating would you give it? ", 1, 10);
}

std::cout << "Updating the movie with a batch \"UPDATE\" statement." << std::endl;

{
    Aws::Vector<Aws::DynamoDB::Model::BatchStatementRequest> statements(
        titles.size());

    std::stringstream sqlStream;
    sqlStream << "UPDATE \"<< MOVIE_TABLE_NAME << \" SET "
        << INFO_KEY << "." << RATING_KEY << "=? WHERE "
        << TITLE_KEY << "=? AND " << YEAR_KEY << "=?";

    std::string sql(sqlStream.str());

    for (size_t i = 0; i < statements.size(); ++i) {
        statements[i].SetStatement(sql);

        Aws::Vector<Aws::DynamoDB::Model::AttributeValue> attributes;
        attributes.push_back(
            Aws::DynamoDB::Model::AttributeValue().SetN(ratings[i]));
        attributes.push_back(
            Aws::DynamoDB::Model::AttributeValue().SetS(titles[i]));

        attributes.push_back(Aws::DynamoDB::Model::AttributeValue().SetN(years[i]));
        statements[i].SetParameters(attributes);
    }

## Scan a table

The following code example shows how to scan a DynamoDB table.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
Aws::Client::ClientConfiguration clientConfig;
```

```
Aws::DynamoDB::DynamoDBClient dynamoClient(clientConfig);
Aws::DynamoDB::Model::ScanRequest req;
req.SetTableName(table);

if (!projection.empty())
    req.SetProjectionExpression(projection);

// Perform scan on table
const Aws::DynamoDB::Model::ScanOutcome& result = dynamoClient.Scan(req);
if (result.IsSuccess())
{
    // Reference the retrieved items
    const Aws::Vector<Aws::Map<Aws::String,
Aws::DynamoDB::Model::AttributeValue>>& items = result.GetResult().GetItems();
    if(items.size() > 0)
    {
        std::cout << "Number of items retrieved from scan: " << items.size() <<
std::endl;
        //Iterate each item and print
        for(const auto &item: items)
        {
            std::cout << "*****";
<< std::endl;
            // Output each retrieved field and its value
            for (const auto& i : item)
                std::cout << i.first << ":" << i.second.GetS() << std::endl;
        }
    }

    else
    {
        std::cout << "No item found in table: " << table << std::endl;
    }
}
else
{
    std::cout << "Failed to Scan items: " << result.GetError().GetMessage();
}
```

- For API details, see [Scan](#) in *AWS SDK for C++ API Reference*.

## Update an item in a table

The following code example shows how to update an item in a DynamoDB table.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
Aws::Client::ClientConfiguration clientConfig;
Aws::DynamoDB::DynamoDBClient dynamoClient(clientConfig);

// *** Define UpdateItem request arguments
// Define TableName argument.
Aws::DynamoDB::Model::UpdateItemRequest request;
request.SetTableName(tableName);

// Define KeyName argument.
```

```
Aws::DynamoDB::Model::AttributeValue attribValue;
attribValue.SetS(keyValue);
request.AddKey("id", attribValue);

// Construct the SET update expression argument.
Aws::String update_expression("SET #a = :valueA");
request.SetUpdateExpression(update_expression);

// Parse the attribute name and value. Syntax: "name=value".
auto parsed = Aws::Utils::StringUtils::Split(attributeNameAndValue, '=');

if (parsed.size() != 2)
{
    std::cout << "Invalid argument syntax: " << attributeNameAndValue << USAGE;
    return 1;
}

// Construct attribute name argument
// Note: Setting the ExpressionAttributeNames argument is required only
// when the name is a reserved word, such as "default". Otherwise, the
// name can be included in the update_expression, as in
// "SET MyAttributeName = :valueA"
Aws::Map<Aws::String, Aws::String> expressionAttributeNames;
expressionAttributeNames["#a"] = parsed[0];
request.SetExpressionAttributeNames(expressionAttributeNames);

// Construct attribute value argument.
Aws::DynamoDB::Model::AttributeValue attributeUpdatedValue;
attributeUpdatedValue.Sets(parsed[1]);
Aws::Map<Aws::String, Aws::DynamoDB::Model::AttributeValue>
expressionAttributeValues;
expressionAttributeValues[":valueA"] = attributeUpdatedValue;
request.SetExpressionAttributeValues(expressionAttributeValues);

// Update the item.
const Aws::DynamoDB::Model::UpdateItemOutcome& result =
dynamoClient.UpdateItem(request);
if (!result.IsSuccess())
{
    std::cout << result.GetError().GetMessage() << std::endl;
    return 1;
}
std::cout << "Item was updated" << std::endl;
```

- For API details, see [UpdateItem](#) in *AWS SDK for C++ API Reference*.

## Scenarios

### Get started using tables, items, and queries

The following code example shows how to:

- Create a table that can hold movie data.
- Put, get, and update a single movie in the table.
- Write movie data to the table from a sample JSON file.
- Query for movies that were released in a given year.
- Scan for movies that were released in a range of years.
- Delete a movie from the table.
- Delete the table.

## Query a table by using batches of PartiQL statements

The following code example shows how to:

- Get a batch of items by running multiple SELECT statements.
- Add a batch of items by running multiple INSERT statements.
- Update a batch of items by running multiple UPDATE statements.
- Delete a batch of items by running multiple DELETE statements.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

## Query a table using PartiQL

The following code example shows how to:

- Get an item by running a SELECT statement.
- Add an item by running an INSERT statement.

- Update an item by running an UPDATE statement.
- Delete an item by running a DELETE statement.

## SDK for C++

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// 1. Create a table. (CreateTable)
if (AwsDoc::DynamoDB::createDynamoDBTable(AwsDoc::DynamoDB::MOVIE_TABLE_NAME,
    clientConfig)) {

## EventBridge examples using SDK for C++

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for C++ with Amazon EventBridge.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2655\)](#)

## Actions

### Add a Lambda function target

The following code example shows how to add an AWS Lambda function target to an Amazon EventBridge event.

#### SDK for C++

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Include the required files.

```
#include <aws/core/Aws.h>
#include <aws/events/EventBridgeClient.h>
#include <aws/events/model/PutTargetsRequest.h>
#include <aws/events/model/PutTargetsResult.h>
#include <aws/core/utils/Outcome.h>
#include <iostream>
```

Add the target.

```
Aws::CloudWatchEvents::EventBridgeClient cwe;

Aws::CloudWatchEvents::Model::Target target;
target.SetArn(lambda_arn);
target.SetId(target_id);

Aws::CloudWatchEvents::Model::PutTargetsRequest request;
request.SetRule(rule_name);
request.AddTargets(target);

auto putTargetsOutcome = cwe.PutTargets(request);
if (!putTargetsOutcome.IsSuccess())
{
    std::cout << "Failed to create CloudWatch events target for rule "
    << rule_name << ":" <<
    putTargetsOutcome.GetError().GetMessage() << std::endl;
}
else
{
    std::cout <<
    "Successfully created CloudWatch events target for rule "
    << rule_name << std::endl;
```

```
}
```

- For API details, see [PutTargets](#) in *AWS SDK for C++ API Reference*.

## Create a scheduled rule

The following code example shows how to create an Amazon EventBridge scheduled rule.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Include the required files.

```
#include <aws/core/Aws.h>
#include <aws/events/EventBridgeClient.h>
#include <aws/events/model/PutRuleRequest.h>
#include <aws/events/model/PutRuleResult.h>
#include <aws/core/utils/Outcome.h>
#include <iostream>
```

Create the rule.

```
Aws::CloudWatchEvents::EventBridgeClient cwe;
Aws::CloudWatchEvents::Model::PutRuleRequest request;
request.SetName(rule_name);
request.SetRoleArn(role_arn);
request.SetScheduleExpression("rate(5 minutes)");
request.SetState(Aws::CloudWatchEvents::Model::RuleState::ENABLED);

auto outcome = cwe.PutRule(request);
if (!outcome.IsSuccess())
{
    std::cout << "Failed to create CloudWatch events rule " <<
        rule_name << ":" << outcome.GetError().GetMessage() <<
        std::endl;
}
else
{
    std::cout << "Successfully created CloudWatch events rule " <<
        rule_name << " with resulting Arn " <<
        outcome.GetResult().GetRuleArn() << std::endl;
}
```

- For API details, see [PutRule](#) in *AWS SDK for C++ API Reference*.

## Send events

The following code example shows how to send Amazon EventBridge events.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Include the required files.

```
#include <aws/core/Aws.h>
#include <aws/events/EventBridgeClient.h>
#include <aws/events/model/PutEventsRequest.h>
#include <aws/events/model/PutEventsResult.h>
#include <aws/core/utils/Outcome.h>
#include <iostream>
```

Send the event.

```
Aws::CloudWatchEvents::EventBridgeClient cwe;

Aws::CloudWatchEvents::Model::PutEventsRequestEntry event_entry;
event_entry.SetDetail(MakeDetails(event_key, event_value));
event_entry.SetDetailType("sampleSubmitted");
event_entry.AddResources(resource_arn);
event_entry.SetSource("aws-sdk-cpp-cloudwatch-example");

Aws::CloudWatchEvents::Model::PutEventsRequest request;
request.AddEntries(event_entry);

auto outcome = cwe.PutEvents(request);
if (!outcome.IsSuccess())
{
    std::cout << "Failed to post CloudWatch event: " <<
        outcome.GetError().GetMessage() << std::endl;
}
else
{
    std::cout << "Successfully posted CloudWatch event" << std::endl;
}
```

- For API details, see [PutEvents](#) in *AWS SDK for C++ API Reference*.

## IAM examples using SDK for C++

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for C++ with AWS Identity and Access Management.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

## Update a user

The following code example shows how to update an IAM user.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
bool AwsDoc::IAM::updateUser(const Aws::String &currentUserNames,
```

```
        const Aws::Client::ClientConfiguration &clientConfig) {
    Aws::IAM::IAMClient iam(clientConfig);

    Aws::IAM::Model::UpdateUserRequest request;
    request.SetUserName(currentUserName);
    request.SetNewUserName(newUserName);

    auto outcome = iam.UpdateUser(request);
    if (outcome.IsSuccess()) {
        std::cout << "IAM user " << currentUserName <<
                    " successfully updated with new user name " << newUserName <<
                    std::endl;
    }
    else {
        std::cerr << "Error updating user name for IAM user " << currentUserName <<
                    ":" << outcome.GetError().GetMessage() << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see [UpdateUser](#) in *AWS SDK for C++ API Reference*.

## Update an access key

The following code example shows how to update an IAM access key.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
bool AwsDoc::IAM::updateAccessKey(const Aws::String &userName,
                                    const Aws::String &accessKeyID,
                                    Aws::IAM::Model::StatusType status,
                                    const Aws::Client::ClientConfiguration &clientConfig)
{
    Aws::IAM::IAMClient iam(clientConfig);
    Aws::IAM::Model::UpdateAccessKeyRequest request;
    request.SetUserName(userName);
    request.SetAccessKeyId(accessKeyID);
    request.SetStatus(status);

    auto outcome = iam.UpdateAccessKey(request);
    if (outcome.IsSuccess()) {
        std::cout << "Successfully updated status of access key "
                    << accessKeyID << " for user " << userName << std::endl;
    }
    else {
        std::cerr << "Error updated status of access key " << accessKeyID <<
                    " for user " << userName << ":" <<
                    outcome.GetError().GetMessage() << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see [UpdateAccessKey](#) in *AWS SDK for C++ API Reference*.

## Scenarios

### Create a user and assume a role

The following code example shows how to:

- Create a user who has no permissions.
- Create a role that grants permission to list Amazon S3 buckets for the account.
- Add a policy to let the user assume the role.
- Assume the role and list Amazon S3 buckets using temporary credentials.
- Delete the policy, role, and user.

### SDK for C++

#### Note

## Amazon S3 examples using SDK for C++

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for C++ with Amazon Simple Storage Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2681\)](#)
- [Scenarios \(p. 2693\)](#)

## Actions

### Add a policy to a bucket

The following code example shows how to add a policy to an S3 bucket.

#### SDK for C++

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
bool AwsDoc::S3::PutBucketPolicy(const Aws::String &bucketName,
                                 const Aws::String &policyBody,
                                 const Aws::Client::ClientConfiguration &clientConfig)
{
```

```

Aws::S3::S3Client s3_client(clientConfig);

std::shared_ptr<Aws::StringStream> request_body =
    Aws::MakeShared<Aws::StringStream>("");
*request_body << policyBody;

Aws::S3::Model::PutBucketPolicyRequest request;
request.SetBucket(bucketName);
request.SetBody(request_body);

Aws::S3::Model::PutBucketPolicyOutcome outcome =
    s3_client.PutBucketPolicy(request);

if (!outcome.IsSuccess()) {
    std::cerr << "Error: PutBucketPolicy: "
        << outcome.GetError().GetMessage() << std::endl;
}
else {
    std::cout << "Set the following policy body for the bucket '" <<
        bucketName << ":" << std::endl << std::endl;
    std::cout << policyBody << std::endl;
}

return outcome.IsSuccess();
}

///! Build a policy JSON string.
/*!

### Copy an object from one bucket to another

The following code example shows how to copy an S3 object from one bucket to another.

## SDK for C++

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
bool AwsDoc::S3::CopyObject(const Aws::String &objectKey, const Aws::String
    &fromBucket, const Aws::String &toBucket,
                                const Aws::Client::ClientConfiguration &clientConfig) {
    Aws::S3::S3Client client(clientConfig);
    Aws::S3::Model::CopyObjectRequest request;

    request.WithCopySource(fromBucket + "/" + objectKey)
        .WithKey(objectKey)
        .WithBucket(toBucket);

    Aws::S3::Model::CopyObjectOutcome outcome = client.CopyObject(request);
    if (!outcome.IsSuccess()) {
        const Aws::S3::S3Error &err = outcome.GetError();
        std::cerr << "Error: CopyObject: " <<
            err.GetExceptionName() << ":" << err.GetMessage() << std::endl;
    }
    else {
        std::cout << "Successfully copied " << objectKey << " from " << fromBucket <<
            " to " << toBucket << "." << std::endl;
    }
    return outcome.IsSuccess();
}
```

- For API details, see [CopyObject](#) in *AWS SDK for C++ API Reference*.

## Create a bucket

The following code example shows how to create an S3 bucket.

## SDK for C++

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
bool AwsDoc::S3::CreateBucket(const Aws::String &bucketName,
                               const Aws::Client::ClientConfiguration &clientConfig) {
    Aws::S3::S3Client client(clientConfig);
    Aws::S3::Model::CreateBucketRequest request;
    request.SetBucket(bucketName);

    //TODO(user): Change the bucket location constraint enum to your target Region.
    if (clientConfig.region != "us-east-1") {
        Aws::S3::Model::CreateBucketConfiguration createBucketConfig;
        createBucketConfig.SetLocationConstraint(
            Aws::S3::Model::BucketLocationConstraintMapper::GetBucketLocationConstraintForName(
                clientConfig.region));
        request.SetCreateBucketConfiguration(createBucketConfig);
    }

    Aws::S3::Model::CreateBucketOutcome outcome = client.CreateBucket(request);
    if (!outcome.IsSuccess()) {
```

```
        auto err = outcome.GetError();
        std::cerr << "Error: CreateBucket: " <<
            err.GetExceptionName() << ":" << err.GetMessage() << std::endl;
    }
    else {
        std::cout << "Created bucket " << bucketName <<
            " in the specified AWS Region." << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see [CreateBucket](#) in *AWS SDK for C++ API Reference*.

## Delete a policy from a bucket

The following code example shows how to delete a policy from an S3 bucket.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
bool AwsDoc::S3::DeleteBucketPolicy(const Aws::String &bucketName,
                                     const Aws::Client::ClientConfiguration
                                     &clientConfig) {
    Aws::S3::S3Client client(clientConfig);

        std::cerr << "Error: DeleteBucket: " <<
            err.GetExceptionName() << ":" << err.GetMessage() << std::endl;
    }
    else {
        std::cout << "The bucket was deleted" << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see [DeleteBucket](#) in *AWS SDK for C++ API Reference*.

## Delete an object

The following code example shows how to delete an S3 object.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
bool AwsDoc::S3::DeleteObject(const Aws::String &objectKey,
                               const Aws::String &fromBucket,
                               const Aws::Client::ClientConfiguration &clientConfig) {
    Aws::S3::S3Client client(clientConfig);
    Aws::S3::Model::DeleteObjectRequest request;

    request.WithKey(objectKey)
        .WithBucket(fromBucket);

    Aws::S3::Model::DeleteObjectOutcome outcome =
        client.DeleteObject(request);

    if (!outcome.IsSuccess()) {
        auto err = outcome.GetError();
        std::cerr << "Error: DeleteObject: " <<
            err.GetExceptionName() << ":" << err.GetMessage() << std::endl;
    }
    else {
        std::cout << "Successfully deleted the object." << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see [DeleteObject](#) in *AWS SDK for C++ API Reference*.

## Delete the website configuration from a bucket

The following code example shows how to delete the website configuration from an S3 bucket.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
bool AwsDoc::S3::DeleteBucketWebsite(const Aws::String &bucketName,
                                      const Aws::Client::ClientConfiguration
&clientConfig) {
    Aws::S3::S3Client client(clientConfig);
    Aws::S3::Model::DeleteBucketWebsiteRequest request;
    request.SetBucket(bucketName);

    Aws::S3::Model::DeleteBucketWebsiteOutcome outcome =
        client.DeleteBucketWebsite(request);

    if (!outcome.IsSuccess()) {
        auto err = outcome.GetError();
        std::cerr << "Error: DeleteBucketWebsite: " <<
            err.GetExceptionName() << ":" << err.GetMessage() << std::endl;
    }
    else {
        std::cout << "Website configuration was removed." << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see [DeleteBucketWebsite](#) in *AWS SDK for C++ API Reference*.

## Get an object from a bucket

The following code example shows how to read data from an object in an S3 bucket.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
bool AwsDoc::S3::GetObject(const Aws::String &objectKey,
                           const Aws::String &fromBucket,
                           const Aws::Client::ClientConfiguration &clientConfig) {
    Aws::S3::S3Client client(clientConfig);

    Aws::S3::Model::GetObjectRequest request;
    request.SetBucket(fromBucket);
    request.SetKey(objectKey);

    Aws::S3::Model::GetObjectOutcome outcome =
        client.GetObject(request);

    if (!outcome.IsSuccess()) {
        const Aws::S3::S3Error &err = outcome.GetError();
        std::cerr << "Error: GetObject: " <<
            err.GetExceptionName() << ":" << err.GetMessage() << std::endl;
    }
}
```

```
        }
    else {
        std::cout << "Successfully retrieved '" << objectKey << "' from ''"
             << fromBucket << '.' << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see [GetObject](#) in *AWS SDK for C++ API Reference*.

## Get the ACL of an object

The following code example shows how to get the access control list (ACL) of an S3 object.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
bool AwsDoc::S3::GetBucketAcl(const Aws::String &bucketName,
                               const Aws::Client::ClientConfiguration &clientConfig) {
    Aws::S3::S3Client s3_client(clientConfig);

        << bucketName << "'.";
}

return outcome.IsSuccess();
}
```

- For API details, see [PutObject](#) in *AWS SDK for C++ API Reference*.

## Scenarios

### Get started with buckets and objects

The following code example shows how to:

- Create a bucket.
- Upload a file to the bucket.
- Download an object from a bucket.
- Copy an object to a subfolder in a bucket.
- List the objects in a bucket.
- Delete the objects in a bucket.
- Delete a bucket.

## Amazon SNS examples using SDK for C++

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for C++ with Amazon Simple Notification Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2698\)](#)

## Actions

### Create a topic

The following code example shows how to create an Amazon SNS topic.

#### SDK for C++

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
Aws::SDKOptions options;
Aws::InitAPI(options);
{
    Aws::String topic_name = argv[1];
    Aws::SNS::SNSClient sns;

    Aws::SNS::Model::CreateTopicRequest ct_req;
    ct_req.SetName(topic_name);

    auto ct_out = sns.CreateTopic(ct_req);

    if (ct_out.IsSuccess())
    {
        std::cout << "Successfully created topic " << topic_name << std::endl;
    }
    else
    {
        std::cout << "Error creating topic " << topic_name << ":" <<
        ct_out.GetError().GetMessage() << std::endl;
    }
}

Aws::ShutdownAPI(options);
```

- For API details, see [CreateTopic](#) in *AWS SDK for C++ API Reference*.

### Delete a subscription

The following code example shows how to delete an Amazon SNS subscription.

## SDK for C++

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
Aws::SDKOptions options;
Aws::InitAPI(options);
{
    Aws::SNS::SNSClient sns;
    Aws::String subscription_arn = argv[1];

    Aws::SNS::Model::UnsubscribeRequest s_req;
    s_req.SetSubscriptionArn(subscription_arn);

    auto s_out = sns.Unsubscribe(s_req);

    if (s_out.IsSuccess())
    {
        std::cout << "Unsubscribed successfully " << std::endl;
    }
    else
    {
        std::cout << "Error while unsubscribing " << s_out.GetError().GetMessage()
            << std::endl;
    }
}

Aws::ShutdownAPI(options);
```

- For API details, see [Unsubscribe](#) in *AWS SDK for C++ API Reference*.

## Delete a topic

The following code example shows how to delete an Amazon SNS topic and all subscriptions to that topic.

## SDK for C++

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
Aws::SDKOptions options;
Aws::InitAPI(options);
{
    Aws::String topic_arn = argv[1];
    Aws::SNS::SNSClient sns;

    Aws::SNS::Model::DeleteTopicRequest dt_req;
    dt_req.SetTopicArn(topic_arn);

    auto dt_out = sns.DeleteTopic(dt_req);

    if (dt_out.IsSuccess())
    {
        std::cout << "Successfully deleted topic " << topic_arn << std::endl;
    }
    else
    {
        std::cout << "Error deleting topic " << topic_arn << ":" <<
```

```
        dt_out.GetError().GetMessage() << std::endl;
    }
}

Aws::ShutdownAPI(options);
```

- For API details, see [DeleteTopic](#) in *AWS SDK for C++ API Reference*.

## Get the properties of a topic

The following code example shows how to get the properties of an Amazon SNS topic.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
Aws::SDKOptions options;
Aws::InitAPI(options);
{
    Aws::SNS::SNSClient sns;
    Aws::String topic_arn = argv[1];

    Aws::SNS::Model::GetTopicAttributesRequest gta_req;
    gta_req.SetTopicArn(topic_arn);

    auto gta_out = sns.GetTopicAttributes(gta_req);

    if (gta_out.IsSuccess())
    {
        std::cout << "Topic Attributes:" << std::endl;
        for (auto const &attribute : gta_out.GetResult().GetAttributes())
        {
            std::cout << " * " << attribute.first << " : " << attribute.second <<
std::endl;
        }
    }
    else
    {
        std::cout << "Error while getting Topic attributes " <<
gta_out.GetError().GetMessage()
        << std::endl;
    }
}

Aws::ShutdownAPI(options);
```

- For API details, see [GetTopicAttributes](#) in *AWS SDK for C++ API Reference*.

## Get the settings for sending SMS messages

The following code example shows how to get the settings for sending Amazon SNS SMS messages.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
Aws::SDKOptions options;
Aws::InitAPI(options);
{
    Aws::SNS::SNSClient sns;

    Aws::SNS::Model::GetSMSAttributesRequest gsmst_req;
    //Set the request to only retrieve the DefaultSMSType setting.
    //Without the following line, GetSMSAttributes would retrieve all settings.
    gsmst_req.AddAttributes("DefaultSMSType");

    auto gsmst_out = sns.GetSMSAttributes(gsmst_req);

    if (gsmst_out.IsSuccess())
    {
        for (auto const& att : gsmst_out.GetResult().GetAttributes())
        {
            std::cout << att.first << ":" << att.second << std::endl;
        }
    }
    else
    {
        std::cout << "Error while getting SMS Type: '" <<
        gsmst_out.GetError().GetMessage()
        << "'" << std::endl;
    }
}

Aws::ShutdownAPI(options);
```

- For API details, see [GetSMSAttributes](#) in *AWS SDK for C++ API Reference*.

## List the subscribers of a topic

The following code example shows how to retrieve the list of subscribers of an Amazon SNS topic.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
Aws::SDKOptions options;
Aws::InitAPI(options);
{
    Aws::SNS::SNSClient sns;

    Aws::SNS::Model::ListSubscriptionsRequest ls_req;

    auto ls_out = sns.ListSubscriptions(ls_req);

    if (ls_out.IsSuccess())
    {
        std::cout << "Subscriptions list:" << std::endl;
        for (auto const& subscription : ls_out.GetResult().GetSubscriptions())
        {
            std::cout << " * " << subscription.GetSubscriptionArn() << std::endl;
        }
    }
    else
    {
```

```
        std::cout << "Error listing subscriptions " << ls_out.GetError().GetMessage() <<
        std::endl;
    }

Aws::ShutdownAPI(options);
```

- For API details, see [ListSubscriptions](#) in *AWS SDK for C++ API Reference*.

## List topics

The following code example shows how to list Amazon SNS topics.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
Aws::SDKOptions options;
Aws::InitAPI(options);
{
    Aws::SNS::SNSClient sns;

    Aws::SNS::Model::ListTopicsRequest lt_req;

    auto lt_out = sns.ListTopics(lt_req);

    if (lt_out.IsSuccess())
    {
        std::cout << "Topics list:" << std::endl;
        for (auto const &topic : lt_out.GetResult().GetTopics())
        {
            std::cout << " * " << topic.GetTopicArn() << std::endl;
        }
    }
    else
    {
        std::cout << "Error listing topics " << lt_out.GetError().GetMessage() <<
        std::endl;
    }
}

Aws::ShutdownAPI(options);
```

- For API details, see [ListTopics](#) in *AWS SDK for C++ API Reference*.

## Publish an SMS text message

The following code example shows how to publish SMS messages using Amazon SNS.

### SDK for C++

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
/**
```

```
* Publish SMS: use Amazon SNS to send an SMS text message to a phone number.
* Note: This requires additional AWS configuration prior to running example.
*
* NOTE: When you start using Amazon SNS to send SMS messages, your AWS account is in
the SMS sandbox and you can only
* use verified destination phone numbers. See https://docs.aws.amazon.com/sns/latest/dg/sns-sms-sandbox.html.
* NOTE: If destination is in the US, you also have an additional restriction that you
have use a dedicated
* origination ID (phone number). You can request an origination number using Amazon
Pinpoint for a fee.
* See https://aws.amazon.com/blogs/compute/provisioning-and-using-10dlc-origination-numbers-with-amazon-sns/
* for more information.
*
* <phone_number_value> input parameter uses E.164 format.
* For example, in United States, this input value should be of the form: +12223334444
*/
int main(int argc, char ** argv)
{
    if (argc != 3)
    {
        std::cout << "Usage: publish_sms <message_value> <phone_number_value> " <<
std::endl;
        return 1;
    }

    Aws::SDKOptions options;
    Aws::InitAPI(options);
    {
        Aws::SNS::SNSClient sns;
        Aws::String message = argv[1];
        Aws::String phone_number = argv[2];

        Aws::SNS::Model::PublishRequest psms_req;
        psms_req.SetMessage(message);
        psms_req.SetPhoneNumber(phone_number);

        auto psms_out = sns.Publish(psms_req);

        if (psms_out.IsSuccess())
        {
            std::cout << "Message published successfully " <<
psms_out.GetResult().GetMessageId()
                << std::endl;
        }
        else
        {
            std::cout << "Error while publishing message " <<
psms_out.GetError().GetMessage()
                << std::endl;
        }
    }

    Aws::ShutdownAPI(options);
    return 0;
}
```

- For API details, see [Publish](#) in [AWS SDK for C++ API Reference](#).

## [Publish to a topic](#)

The following code example shows how to publish messages to an Amazon SNS topic.

## SDK for C++

### Note

### Create a table

The following code example shows how to create a DynamoDB table.

### SDK for Go V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// TableBasics encapsulates the Amazon DynamoDB service actions used in the examples.  
// It contains a DynamoDB service client that is used to act on the specified table.  
type TableBasics struct {  
    dynamodb.Client  
    TableName string  
}  
  
// CreateMovieTable creates a DynamoDB table with a composite primary key defined as  
// a string sort key named `title`, and a numeric partition key named `year`.  
// This function uses NewTableExistsWaiter to wait for the table to be created by  
// DynamoDB before it returns.  
func (basics TableBasics) CreateMovieTable() (*types.TableDescription, error) {  
    var tableDesc *types.TableDescription  
    table, err := basics.DynamoDbClient.CreateTable(context.TODO(),  
&dynamodb.CreateTableInput{  
    AttributeDefinitions: []types.AttributeDefinition{  
        {AttributeName: aws.String("year"),  
         AttributeType: types.ScalarAttributeTypeN},  
    }, {  
        {AttributeName: aws.String("title"),  
         AttributeType: types.ScalarAttributeTypeS},  
    },  
    KeySchema: []types.KeySchemaElement{  
        {AttributeName: aws.String("year"),  
         KeyType: types.KeyTypeHash},  
    }, {  
        {AttributeName: aws.String("title"),  
         KeyType: types.KeyTypeRange},  
    },  
    TableName: aws.String(basics.TableName),  
    ProvisionedThroughput: &types.ProvisionedThroughput{  
        ReadCapacityUnits: aws.Int64(10),  
        WriteCapacityUnits: aws.Int64(10),  
    },  
})  
if err != nil {  
    log.Printf("Couldn't create table %v. Here's why: %v\n", basics.TableName, err)  
} else {  
    waiter := dynamodb.NewTableExistsWaiter(basics.DynamoDbClient)  
    err = waiter.Wait(context.TODO(), &dynamodb.DescribeTableInput{  
        TableName: aws.String(basics.TableName)}, 5*time.Minute)  
    if err != nil {  
        log.Printf("Wait for table exists failed. Here's why: %v\n", err)  
    }  
    tableDesc = table.TableDescription  
}  
return tableDesc, err  
}
```

- For API details, see [CreateTable](#) in *AWS SDK for Go API Reference*.

## Delete a table

The following code example shows how to delete a DynamoDB table.

## SDK for Go V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// TableBasics encapsulates the Amazon DynamoDB service actions used in the examples.
// It contains a DynamoDB service client that is used to act on the specified table.
type TableBasics struct {
    DynamoDbClient *dynamodb.Client
    TableName       string
}

// DeleteTable deletes the DynamoDB table and all of its data.
func (basics TableBasics) DeleteTable() error {
    _, err := basics.DynamoDbClient.DeleteTable(context.TODO(),
        &dynamodb.DeleteTableInput{
            TableName: aws.String(basics.TableName)})
    if err != nil {
        log.Printf("Couldn't delete table %v. Here's why: %v\n", basics.TableName, err)
    }
    return err
}
```

- For API details, see [DeleteTable](#) in *AWS SDK for Go API Reference*.

## Delete an item from a table

The following code example shows how to delete an item from a DynamoDB table.

## SDK for Go V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// TableBasics encapsulates the Amazon DynamoDB service actions used in the examples.
// It contains a DynamoDB service client that is used to act on the specified table.
type TableBasics struct {
    DynamoDbClient *dynamodb.Client
    TableName       string
}

// DeleteMovie removes a movie from the DynamoDB table.
func (basics TableBasics) DeleteMovie(movie Movie) error {
    _, err := basics.DynamoDbClient.DeleteItem(context.TODO(), &dynamodb.DeleteItemInput{
        TableName: aws.String(basics.TableName), Key: movie.GetKey(),
    })
    if err != nil {
        log.Printf("Couldn't delete %v from the table. Here's why: %v\n", movie.Title, err)
    }
    return err
}
```

- For API details, see [DeleteItem](#) in *AWS SDK for Go API Reference*.

## Get an item from a table

The following code example shows how to get an item from a DynamoDB table.

### SDK for Go V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// TableBasics encapsulates the Amazon DynamoDB service actions used in the examples.  
// It contains a DynamoDB service client that is used to act on the specified table.  
type TableBasics struct {  
    dynamodb.Client  
    TableName string  
}  
  
  
// GetMovie gets movie data from the DynamoDB table by using the primary composite key  
// made of title and year.  
func (basics TableBasics) GetMovie(title string, year int) (Movie, error) {  
    movie := Movie{Title: title, Year: year}  
    response, err := basics.DynamoDbClient.GetItem(context.TODO(), &dynamodb.GetItemInput{  
        Key: movie.GetKey(), TableName: aws.String(basics.TableName),  
    })  
    if err != nil {  
        log.Printf("Couldn't get info about %v. Here's why: %v\n", title, err)  
    } else {  
        err = attributevalue.UnmarshalMap(response.Item, &movie)  
        if err != nil {  
            log.Printf("Couldn't unmarshal response. Here's why: %v\n", err)  
        }  
    }  
    return movie, err  
}
```

- For API details, see [GetItem](#) in *AWS SDK for Go API Reference*.

## Get information about a table

The following code example shows how to get information about a DynamoDB table.

### SDK for Go V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// TableBasics encapsulates the Amazon DynamoDB service actions used in the examples.  
// It contains a DynamoDB service client that is used to act on the specified table.
```

```
type TableBasics struct {
    DynamoDbClient *dynamodb.Client
    TableName       string
}

// TableExists determines whether a DynamoDB table exists.
func (basics TableBasics) TableExists() (bool, error) {
    exists := true
    _, err := basics.DynamoDbClient.DescribeTable(
        context.TODO(), &dynamodb.DescribeTableInput{TableName:
            aws.String(basics.TableName)},
    )
    if err != nil {
        var notFoundEx *types.ResourceNotFoundException
        if errors.As(err, &notFoundEx) {
            log.Printf("Table %v does not exist.\n", basics.TableName)
            err = nil
        } else {
            log.Printf("Couldn't determine existence of table %v. Here's why: %v\n",
                basics.TableName, err)
        }
        exists = false
    }
    return exists, err
}
```

- For API details, see [DescribeTable](#) in *AWS SDK for Go API Reference*.

## List tables

The following code example shows how to list DynamoDB tables.

### SDK for Go V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// TableBasics encapsulates the Amazon DynamoDB service actions used in the examples.
// It contains a DynamoDB service client that is used to act on the specified table.
type TableBasics struct {
    DynamoDbClient *dynamodb.Client
    TableName       string
}

// ListTables lists the DynamoDB table names for the current account.
func (basics TableBasics) ListTables() ([]string, error) {
    var tableNames []string
    tables, err := basics.DynamoDbClient.ListTables(
        context.TODO(), &dynamodb.ListTablesInput{})
    if err != nil {
        log.Printf("Couldn't list tables. Here's why: %v\n", err)
    } else {
        tableNames = tables.TableNames
    }
    return tableNames, err
}
```

```
}
```

- For API details, see [ListTables](#) in *AWS SDK for Go API Reference*.

## Put an item in a table

The following code example shows how to put an item in a DynamoDB table.

### SDK for Go V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// TableBasics encapsulates the Amazon DynamoDB service actions used in the examples.
// It contains a DynamoDB service client that is used to act on the specified table.
type TableBasics struct {
    DynamoDbClient *dynamodb.Client
    TableName      string
}

// AddMovie adds a movie to the DynamoDB table.
func (basics TableBasics) AddMovie(movie Movie) error {
    item, err := attributevalue.MarshalMap(movie)
    if err != nil {
        panic(err)
    }
    _, err = basics.DynamoDbClient.PutItem(context.TODO(), &dynamodb.PutItemInput{
        TableName: aws.String(basics.TableName), Item: item,
    })
    if err != nil {
        log.Printf("Couldn't add item to table. Here's why: %v\n", err)
    }
    return err
}
```

- For API details, see [PutItem](#) in *AWS SDK for Go API Reference*.

## Query a table

The following code example shows how to query a DynamoDB table.

### SDK for Go V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// TableBasics encapsulates the Amazon DynamoDB service actions used in the examples.
// It contains a DynamoDB service client that is used to act on the specified table.
type TableBasics struct {
    DynamoDbClient *dynamodb.Client
}
```

```
    TableName      string
}

// Query gets all movies in the DynamoDB table that were released in the specified
// year.
// The function uses the `expression` package to build the key condition expression
// that is used in the query.
func (basics TableBasics) Query(releaseYear int) ([]Movie, error) {
    var err error
    var response *dynamodb.QueryOutput
    var movies []Movie
    keyEx := expression.Key("year").Equal(expression.Value(releaseYear))
    expr, err := expression.NewBuilder().WithKeyCondition(keyEx).Build()
    if err != nil {
        log.Printf("Couldn't build expression for query. Here's why: %v\n", err)
    } else {
        response, err = basics.DynamoDbClient.Query(context.TODO(), &dynamodb.QueryInput{
            TableName:           aws.String(basics.TableName),
            ExpressionAttributeNames: expr.Names(),
            ExpressionAttributeValues: expr.Values(),
            KeyConditionExpression:   expr.KeyCondition(),
        })
        if err != nil {
            log.Printf("Couldn't query for movies released in %v. Here's why: %v\n",
releaseYear, err)
        } else {
            err = attributevalue.UnmarshalListOfMaps(response.Items, &movies)
            if err != nil {
                log.Printf("Couldn't unmarshal query response. Here's why: %v\n", err)
            }
        }
    }
    return movies, err
}
```

- For API details, see [Query in AWS SDK for Go API Reference](#).

## Run a PartiQL statement

The following code example shows how to run a PartiQL statement on a DynamoDB table.

### SDK for Go V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Use an INSERT statement to add an item.

```
// AddMovie runs a PartiQL INSERT statement to add a movie to the DynamoDB table.
func (runner PartiQLRunner) AddMovie(movie Movie) error {
    params, err := attributevalue.MarshalList([]interface{}{movie.Title, movie.Year,
    movie.Info})
    if err != nil {
        panic(err)
    }
    _, err = runner.DynamoDbClient.ExecuteStatement(context.TODO(),
&dynamodb.ExecuteStatementInput{
    Statement: aws.String(
```

```
    fmt.Sprintf("INSERT INTO \"%v\" VALUE {'title': ?, 'year': ?, 'info': ?}",
    runner.TableName)),
Parameters: params,
})
if err != nil {
log.Printf("Couldn't insert an item with PartiQL. Here's why: %v\n", err)
}
return err
}
```

Use a SELECT statement to get an item.

```
// GetMovie runs a PartiQL SELECT statement to get a movie from the DynamoDB table by
// title and year.
func (runner PartiQLRunner) GetMovie(title string, year int) (Movie, error) {
var movie Movie
params, err := attributevalue.MarshalList([]interface{}{title, year})
if err != nil {
panic(err)
}
response, err := runner.DynamoDbClient.ExecuteStatement(context.TODO(),
&dynamodb.ExecuteStatementInput{
Statement: aws.String(
fmt.Sprintf("SELECT * FROM \"%v\" WHERE title=? AND year=?",
runner.TableName)),
Parameters: params,
})
if err != nil {
log.Printf("Couldn't get info about %v. Here's why: %v\n", title, err)
} else {
err = attributevalue.UnmarshalMap(response.Items[0], &movie)
if err != nil {
log.Printf("Couldn't unmarshal response. Here's why: %v\n", err)
}
}
return movie, err
}
```

Use a SELECT statement to get a list of items and project the results.

```
// GetAllMovies runs a PartiQL SELECT statement to get all movies from the DynamoDB
table.
// The results are projected to return only the title and rating of each movie.
func (runner PartiQLRunner) GetAllMovies() ([]map[string]interface{}, error) {
var output []map[string]interface{}
response, err := runner.DynamoDbClient.ExecuteStatement(context.TODO(),
&dynamodb.ExecuteStatementInput{
Statement: aws.String(
fmt.Sprintf("SELECT title, info.rating FROM \"%v\"", runner.TableName)),
})
if err != nil {
log.Printf("Couldn't get movies. Here's why: %v\n", err)
} else {
err = attributevalue.UnmarshalListOfMaps(response.Items, &output)
if err != nil {
log.Printf("Couldn't unmarshal response. Here's why: %v\n", err)
}
}
```

```
    }
    return output, err
}
```

Use an UPDATE statement to update an item.

```
// UpdateMovie runs a PartiQL UPDATE statement to update the rating of a movie that
// already exists in the DynamoDB table.
func (runner PartiQLRunner) UpdateMovie(movie Movie, rating float64) error {
    params, err := attributevalue.MarshalList([]interface{}{rating, movie.Title,
        movie.Year})
    if err != nil {
        panic(err)
    }
    _, err = runner.DynamoDbClient.ExecuteStatement(context.TODO(),
        &dynamodb.ExecuteStatementInput{
            Statement: aws.String(
                fmt.Sprintf("UPDATE \"%v\" SET info.rating=? WHERE title=? AND year=?",
                    runner.TableName)),
            Parameters: params,
        })
    if err != nil {
        log.Printf("Couldn't update movie %v. Here's why: %v\n", movie.Title, err)
    }
    return err
}
```

Use a DELETE statement to delete an item.

```
// DeleteMovie runs a PartiQL DELETE statement to remove a movie from the DynamoDB
// table.
func (runner PartiQLRunner) DeleteMovie(movie Movie) error {
    params, err := attributevalue.MarshalList([]interface{}{movie.Title, movie.Year})
    if err != nil {
        panic(err)
    }
    _, err = runner.DynamoDbClient.ExecuteStatement(context.TODO(),
        &dynamodb.ExecuteStatementInput{
            Statement: aws.String(
                fmt.Sprintf("DELETE FROM \"%v\" WHERE title=? AND year=?",
                    runner.TableName)),
            Parameters: params,
        })
    if err != nil {
        log.Printf("Couldn't delete %v from the table. Here's why: %v\n", movie.Title, err)
    }
    return err
}
```

- For API details, see [ExecuteStatement](#) in *AWS SDK for Go API Reference*.

## Run batches of PartiQL statements

The following code example shows how to run batches of PartiQL statements on a DynamoDB table.

## SDK for Go V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Use batches of INSERT statements to add items.

```
// AddMovieBatch runs a batch of PartiQL INSERT statements to add multiple movies to
// the
// DynamoDB table.
func (runner PartiQLRunner) AddMovieBatch(movies []Movie) error {
    statementRequests := make([]types.BatchStatementRequest, len(movies))
    for index, movie := range movies {
        params, err := attributevalue.MarshalList([]interface{}{movie.Title, movie.Year,
            movie.Info})
        if err != nil {
            panic(err)
        }
        statementRequests[index] = types.BatchStatementRequest{
            Statement: aws.String(fmt.Sprintf(
                "INSERT INTO \"%v\" VALUE {'title': ?, 'year': ?, 'info': ?}", runner.TableName)),
            Parameters: params,
        }
    }

    _, err := runner.DynamoDbClient.BatchExecuteStatement(context.TODO(),
        &dynamodb.BatchExecuteStatementInput{
            Statements: statementRequests,
        })
    if err != nil {
        log.Printf("Couldn't insert a batch of items with PartiQL. Here's why: %v\n", err)
    }
    return err
}
```

Use batches of SELECT statements to get items.

```
// GetMovieBatch runs a batch of PartiQL SELECT statements to get multiple movies from
// the DynamoDB table by title and year.
func (runner PartiQLRunner) GetMovieBatch(movies []Movie) ([]Movie, error) {
    statementRequests := make([]types.BatchStatementRequest, len(movies))
    for index, movie := range movies {
        params, err := attributevalue.MarshalList([]interface{}{movie.Title, movie.Year})
        if err != nil {
            panic(err)
        }
        statementRequests[index] = types.BatchStatementRequest{
            Statement: aws.String(
                fmt.Sprintf("SELECT * FROM \"%v\" WHERE title=? AND year=?", runner.TableName)),
            Parameters: params,
        }
    }

    output, err := runner.DynamoDbClient.BatchExecuteStatement(context.TODO(),
        &dynamodb.BatchExecuteStatementInput{
            Statements: statementRequests,
        })
    var outMovies []Movie
    if err != nil {
```

```
    log.Printf("Couldn't get a batch of items with PartiQL. Here's why: %v\n", err)
} else {
    for _, response := range output.Responses {
        var movie Movie
        err = attributevalue.UnmarshalMap(response.Item, &movie)
        if err != nil {
            log.Printf("Couldn't unmarshal response. Here's why: %v\n", err)
        } else {
            outMovies = append(outMovies, movie)
        }
    }
}
return outMovies, err
}
```

Use batches of UPDATE statements to update items.

```
// UpdateMovieBatch runs a batch of PartiQL UPDATE statements to update the rating of
// multiple movies that already exist in the DynamoDB table.
func (runner PartiQLRunner) UpdateMovieBatch(movies []Movie, ratings []float64) error {
    statementRequests := make([]types.BatchStatementRequest, len(movies))
    for index, movie := range movies {
        params, err := attributevalue.MarshalList([]interface{}{ratings[index], movie.Title,
        movie.Year})
        if err != nil {
            panic(err)
        }
        statementRequests[index] = types.BatchStatementRequest{
            Statement: aws.String(
                fmt.Sprintf("UPDATE \"%v\" SET info.rating=? WHERE title=? AND year=?",
runner.TableName)),
            Parameters: params,
        }
    }

    _, err := runner.DynamoDbClient.BatchExecuteStatement(context.TODO(),
&dynamodb.BatchExecuteStatementInput{
    Statements: statementRequests,
})
    if err != nil {
        log.Printf("Couldn't update the batch of movies. Here's why: %v\n", err)
    }
    return err
}
```

Use batches of DELETE statements to delete items.

```
// DeleteMovieBatch runs a batch of PartiQL DELETE statements to remove multiple movies
// from the DynamoDB table.
func (runner PartiQLRunner) DeleteMovieBatch(movies []Movie) error {
    statementRequests := make([]types.BatchStatementRequest, len(movies))
    for index, movie := range movies {
        params, err := attributevalue.MarshalList([]interface{}{movie.Title, movie.Year})
        if err != nil {
            panic(err)
        }
        statementRequests[index] = types.BatchStatementRequest{
```

```
    Statement: aws.String(
        fmt.Sprintf("DELETE FROM \"%v\" WHERE title=? AND year=?", runner.TableName)),
    Parameters: params,
}
}

_, err := runner.DynamoDbClient.BatchExecuteStatement(context.TODO(),
&dynamodb.BatchExecuteStatementInput{
    Statements: statementRequests,
})
if err != nil {
    log.Printf("Couldn't delete the batch of movies. Here's why: %v\n", err)
}
return err
}
```

- For API details, see [BatchExecuteStatement](#) in *AWS SDK for Go API Reference*.

## Scan a table

The following code example shows how to scan a DynamoDB table.

### SDK for Go V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// TableBasics encapsulates the Amazon DynamoDB service actions used in the examples.
// It contains a DynamoDB service client that is used to act on the specified table.
type TableBasics struct {
    DynamoDbClient *dynamodb.Client
    TableName       string
}

// Scan gets all movies in the DynamoDB table that were released in a range of years
// and projects them to return a reduced set of fields.
// The function uses the `expression` package to build the filter and projection
// expressions.
func (basics TableBasics) Scan(startYear int, endYear int) ([]Movie, error) {
    var movies []Movie
    var err error
    var response *dynamodb.ScanOutput
    filtEx := expression.Name("year").Between(expression.Value(startYear),
        expression.Value(endYear))
    projEx := expression.NamesList(
        expression.Name("year"), expression.Name("title"), expression.Name("info.rating"))
    expr, err := expression.NewBuilder().WithFilter(filtEx).WithProjection(projEx).Build()
    if err != nil {
        log.Printf("Couldn't build expressions for scan. Here's why: %v\n", err)
    } else {
        response, err = basics.DynamoDbClient.Scan(context.TODO(), &dynamodb.ScanInput{
            TableName:                 aws.String(basics.TableName),
            ExpressionAttributeNames: expr.Names(),
            ExpressionAttributeValues: expr.Values(),
            FilterExpression:          expr.Filter(),
            ProjectionExpression:     expr.Projection(),
        })
    }
    if err != nil {
        log.Printf("Error scanning table: %v\n", err)
    } else {
        movies = response.Items
    }
    return movies, err
}
```

```
        })
        if err != nil {
            log.Printf("Couldn't scan for movies released between %v and %v. Here's why: %v\n",
                startYear, endYear, err)
        } else {
            err = attributevalue.UnmarshalListOfMaps(response.Items, &movies)
            if err != nil {
                log.Printf("Couldn't unmarshal query response. Here's why: %v\n", err)
            }
        }
    }
    return movies, err
}
```

- For API details, see [Scan](#) in *AWS SDK for Go API Reference*.

## Update an item in a table

The following code example shows how to update an item in a DynamoDB table.

### SDK for Go V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// TableBasics encapsulates the Amazon DynamoDB service actions used in the examples.
// It contains a DynamoDB service client that is used to act on the specified table.
type TableBasics struct {
    DynamoDbClient *dynamodb.Client
    TableName       string
}

// UpdateMovie updates the rating and plot of a movie that already exists in the
// DynamoDB table. This function uses the `expression` package to build the update
// expression.
func (basics TableBasics) UpdateMovie(movie Movie) (map[string]map[string]interface{}, error) {
    var err error
    var response *dynamodb.UpdateItemOutput
    var attributeMap map[string]map[string]interface{}
    update := expression.Set(expression.Name("info.rating"),
        expression.Value(movie.Info["rating"]))
    update.Set(expression.Name("info.plot"), expression.Value(movie.Info["plot"]))
    expr, err := expression.NewBuilder().WithUpdate(update).Build()
    if err != nil {
        log.Printf("Couldn't build expression for update. Here's why: %v\n", err)
    } else {
        response, err = basics.DynamoDbClient.UpdateItem(context.TODO(),
            &dynamodb.UpdateItemInput{
                TableName:           aws.String(basics.TableName),
                Key:                movie.GetKey(),
                ExpressionAttributeNames: expr.Names(),
                ExpressionAttributeValues: expr.Values(),
                UpdateExpression:      expr.Update(),
                ReturnValue:          types.ReturnValueUpdatedNew,
            })
    }
}
```

```
    if err != nil {
        log.Printf("Couldn't update movie %v. Here's why: %v\n", movie.Title, err)
    } else {
        err = attributevalue.UnmarshalMap(response.Attributes, &attributeMap)
        if err != nil {
            log.Printf("Couldn't unmarshal update response. Here's why: %v\n", err)
        }
    }
}
return attributeMap, err
}
```

- For API details, see [UpdateItem](#) in *AWS SDK for Go API Reference*.

## Write a batch of items

The following code example shows how to write a batch of DynamoDB items.

### SDK for Go V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// TableBasics encapsulates the Amazon DynamoDB service actions used in the examples.
// It contains a DynamoDB service client that is used to act on the specified table.
type TableBasics struct {
    dynamodb.Client
    TableName     string
}

// AddMovieBatch adds a slice of movies to the DynamoDB table. The function sends
// batches of 25 movies to DynamoDB until all movies are added or it reaches the
// specified maximum.
func (basics TableBasics) AddMovieBatch(movies []Movie, maxMovies int) (int, error) {
    var err error
    var item map[string]types.AttributeValue
    written := 0
    batchSize := 25 // DynamoDB allows a maximum batch size of 25 items.
    start := 0
    end := start + batchSize
    for start < maxMovies && start < len(movies) {
        var writeReqs []types.WriteRequest
        if end > len(movies) {
            end = len(movies)
        }
        for _, movie := range movies[start:end] {
            item, err = attributevalue.MarshalMap(movie)
            if err != nil {
                log.Printf("Couldn't marshal movie %v for batch writing. Here's why: %v\n",
                    movie.Title, err)
            } else {
                writeReqs = append(
                    writeReqs,
                    types.WriteRequest{PutRequest: &types.PutRequest{Item: item}},
                )
            }
        }
    }
}
```

```
_, err = basics.DynamoDbClient.BatchWriteItem(context.TODO(),
&dynamodb.BatchWriteItemInput{
    RequestItems: map[string][]types.WriteRequest{basics.TableName: writeReqs}})
if err != nil {
    log.Printf("Couldn't add a batch of movies to %v. Here's why: %v\n",
    basics.TableName, err)
} else {
    written += len(writeReqs)
}
start = end
end += batchSize
}

return written, err
}
```

- For API details, see [BatchWriteItem in AWS SDK for Go API Reference](#).

## Scenarios

### Get started using tables, items, and queries

The following code example shows how to:

- Create a table that can hold movie data.
- Put, get, and update a single movie in the table.
- Write movie data to the table from a sample JSON file.
- Query for movies that were released in a given year.
- Scan for movies that were released in a range of years.
- Delete a movie from the table.
- Delete the table.

## SDK for Go V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a struct and methods that call DynamoDB actions.

```
// TableBasics encapsulates the Amazon DynamoDB service actions used in the examples.
// It contains a DynamoDB service client that is used to act on the specified table.
type TableBasics struct {
    DynamoDbClient *dynamodb.Client
    TableName       string
}

// TableExists determines whether a DynamoDB table exists.
func (basics TableBasics) TableExists() (bool, error) {
    exists := true
    _, err := basics.DynamoDbClient.DescribeTable(
        context.TODO(), &dynamodb.DescribeTableInput{TableName:
            aws.String(basics.TableName)},
    )
}
```

```

if err != nil {
    var notFoundEx *types.ResourceNotFoundException
    if errors.As(err, &notFoundEx) {
        log.Printf("Table %v does not exist.\n", basics.TableName)
        err = nil
    } else {
        log.Printf("Couldn't determine existence of table %v. Here's why: %v\n",
        basics.TableName, err)
    }
    exists = false
}
return exists, err
}

// CreateMovieTable creates a DynamoDB table with a composite primary key defined as
// a string sort key named `title`, and a numeric partition key named `year`.
// This function uses NewTableExistsWaiter to wait for the table to be created by
// DynamoDB before it returns.
func (basics TableBasics) CreateMovieTable() (*types.TableDescription, error) {
    var tableDesc *types.TableDescription
    table, err := basics.DynamoDbClient.CreateTable(context.TODO(),
    &dynamodb.CreateTableInput{
        AttributeDefinitions: []types.AttributeDefinition{{
           AttributeName: aws.String("year"),
           AttributeType: types.ScalarAttributeTypeN,
        }, {
           AttributeName: aws.String("title"),
           AttributeType: types.ScalarAttributeTypeS,
        }},
        KeySchema: []types.KeySchemaElement{{
           AttributeName: aws.String("year"),
           KeyType:      types.KeyTypeHash,
        }, {
           AttributeName: aws.String("title"),
           KeyType:      types.KeyTypeRange,

## Query a table by using batches of PartiQL statements

The following code example shows how to:

- Get a batch of items by running multiple SELECT statements.
- Add a batch of items by running multiple INSERT statements.
- Update a batch of items by running multiple UPDATE statements.
- Delete a batch of items by running multiple DELETE statements.

### SDK for Go V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a struct that is a receiver for methods that can run PartiQL statements.

```
// PartiQLRunner encapsulates the Amazon DynamoDB service actions used in the
// PartiQL examples. It contains a DynamoDB service client that is used to act on the
// specified table.
type PartiQLRunner struct {
    DynamoDbClient *dynamodb.Client
    TableName       string
}

// AddMovieBatch runs a batch of PartiQL INSERT statements to add multiple movies to
// the
// DynamoDB table.
func (runner PartiQLRunner) AddMovieBatch(movies []Movie) error {
    statementRequests := make([]types.BatchStatementRequest, len(movies))
    for index, movie := range movies {
        params, err := attributevalue.MarshalList([]interface{}{movie.Title, movie.Year,
        movie.Info})
        if err != nil {
            panic(err)
        }
        statementRequests[index] = types.BatchStatementRequest{
            Statement: aws.String(fmt.Sprintf(
                "INSERT INTO \"%v\" VALUE {'title': ?, 'year': ?, 'info': ?}", runner.TableName)),
            Parameters: params,
        }
    }
    _, err := runner.DynamoDbClient.BatchExecuteStatement(context.TODO(),
    &dynamodb.BatchExecuteStatementInput{
        Statements: statementRequests,
    })
    if err != nil {
        log.Printf("Couldn't insert a batch of items with PartiQL. Here's why: %v\n", err)

## Query a table using PartiQL

The following code example shows how to:

- Get an item by running a SELECT statement.
- Add an item by running an INSERT statement.
- Update an item by running an UPDATE statement.
- Delete an item by running a DELETE statement.

### SDK for Go V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a struct that is a receiver for methods that can run PartiQL statements.

```
// PartiQLRunner encapsulates the Amazon DynamoDB service actions used in the
// PartiQL examples. It contains a DynamoDB service client that is used to act on the
// specified table.
type PartiQLRunner struct {
    DynamoDbClient *dynamodb.Client
    TableName       string
}

// AddMovie runs a PartiQL INSERT statement to add a movie to the DynamoDB table.
func (runner PartiQLRunner) AddMovie(movie Movie) error {
    params, err := attributevalue.MarshalList([]interface{}{movie.Title, movie.Year,
        movie.Info})
    if err != nil {
        panic(err)
    }
    _, err = runner.DynamoDbClient.ExecuteStatement(context.TODO(),
        &dynamodb.ExecuteStatementInput{
            Statement: aws.String(
                fmt.Sprintf("INSERT INTO \"%v\" VALUE {'title': ?, 'year': ?, 'info': ?}",
```

```
        runner.TableName)),
    Parameters: params,
})
if err != nil {
    log.Printf("Couldn't insert an item with PartiQL. Here's why: %v\n", err)
}
return err
}

// GetMovie runs a PartiQL SELECT statement to get a movie from the DynamoDB table by
// title and year.
func (runner PartiQLRunner) GetMovie(title string, year int) (Movie, error) {
var movie Movie
params, err := attributevalue.MarshalList([]interface{}{title, year})
if err != nil {
    panic(err)
}
response, err := runner.DynamoDbClient.ExecuteStatement(context.TODO(),
&dynamodb.ExecuteStatementInput{
    Statement: aws.String(
        fmt.Sprintf("SELECT * FROM \"%v\" WHERE title=? AND year=?", 
            runner.TableName)),
    Parameters: params,
})
if err != nil {
    log.Printf("Couldn't get info about %v. Here's why: %v\n", title, err)
} else {
    err = attributevalue.UnmarshalMap(response.Items[0], &movie)
    if err != nil {
        log.Printf("Couldn't unmarshal response. Here's why: %v\n", err)
    }
}
return movie, err
}

// UpdateMovie runs a PartiQL UPDATE statement to update the rating of a movie that
// already exists in the DynamoDB table.
func (runner PartiQLRunner) UpdateMovie(movie Movie, rating float64) error {
params, err := attributevalue.MarshalList([]interface{}{rating, movie.Title, 
    movie.Year})
if err != nil {
    panic(err)
}
_, err = runner.DynamoDbClient.ExecuteStatement(context.TODO(),
&dynamodb.ExecuteStatementInput{
    Statement: aws.String(
        fmt.Sprintf("UPDATE \"%v\" SET info.rating=? WHERE title=? AND year=?", 
            runner.TableName)),
    Parameters: params,
})
if err != nil {
    log.Printf("Couldn't update movie %v. Here's why: %v\n", movie.Title, err)
}
return err
}

// DeleteMovie runs a PartiQL DELETE statement to remove a movie from the DynamoDB
// table.
func (runner PartiQLRunner) DeleteMovie(movie Movie) error {
params, err := attributevalue.MarshalList([]interface{}{movie.Title, movie.Year})
```

```
if err != nil {
    panic(err)
}
_, err = runner.DynamoDbClient.ExecuteStatement(context.TODO(),
&dynamodb.ExecuteStatementInput{
    Statement: aws.String(
        fmt.Sprintf("DELETE FROM \"%v\" WHERE title=? AND year=?",
            runner.TableName)),
    Parameters: params,
})
if err != nil {
    log.Printf("Couldn't delete %v from the table. Here's why: %v\n", movie.Title, err)
}
return err
}
```

Run a scenario that creates a table and runs PartiQL queries.

```
// RunPartiQLSingleScenario shows you how to use the AWS SDK for Go
// to use PartiQL to query a table that stores data about movies.
//
// * Use PartiQL statements to add, get, update, and delete data for individual movies.
//
// This example creates an Amazon DynamoDB service client from the specified sdkConfig
// so that
// you can replace it with a mocked or stubbed config for unit testing.
//
// This example creates and deletes a DynamoDB table to use during the scenario.
func RunPartiQLSingleScenario(sdkConfig aws.Config, tableName string) {
    defer func() {
        if r := recover(); r != nil {
            fmt.Printf("Something went wrong with the demo.")
        }
    }()

    log.Println(strings.Repeat("-", 88))
    log.Println("Welcome to the Amazon DynamoDB PartiQL single action demo.")
    log.Println(strings.Repeat("-", 88))

    tableBasics := actions.TableBasics{
        DynamoDbClient: dynamodb.NewFromConfig(sdkConfig),
        TableName:      tableName,
    }
    runner := actions.PartiQLRunner{
        DynamoDbClient: dynamodb.NewFromConfig(sdkConfig),
        TableName:      tableName,
    }

    exists, err := tableBasics.TableExists()
    if err != nil {
        panic(err)
    }
    if !exists {
        log.Printf("Creating table %v...\n", tableName)
        _, err = tableBasics.CreateMovieTable()
        if err != nil {
            panic(err)
        } else {
            log.Printf("Created table %v.\n", tableName)
        }
    } else {
        log.Printf("Table %v already exists.\n", tableName)
```

```

    }

    log.Println(strings.Repeat("-", 88))

    currentYear, _, _ := time.Now().Date()
    customMovie := actions.Movie{
        Title: "24 Hour PartiQL People",
        Year: currentYear,
        Info: map[string]interface{}{
            "plot": "A group of data developers discover a new query language they can't stop
using.",

## IAM examples using SDK for Go V2

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Go V2 with AWS Identity and Access Management.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2746\)](#)
- [Scenarios \(p. 2767\)](#)

## Actions

### Attach a policy to a role

The following code example shows how to attach an IAM policy to a role.

#### SDK for Go V2

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// AttachRolePolicy

_, err = service.AttachRolePolicy(context.Background(), &iam.AttachRolePolicyInput{
    PolicyArn: aws.String(ExamplePolicyARN),
    RoleName:  aws.String(ExampleRoleName),
})

if err != nil {
    panic("Couldn't apply a policy to the role!")
}

fmt.Println("## Attached policy " + ExamplePolicyARN + " to role " + ExampleRoleName)
```

- For API details, see [AttachRolePolicy](#) in *AWS SDK for Go API Reference*.

### Attach a policy to a user

The following code example shows how to attach an IAM policy to a user.

#### SDK for Go V2

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```

## Detach a policy from a user

The following code example shows how to detach an IAM policy from a user.

### SDK for Go V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
package main

import (
    "context"
    "flag"
    "fmt"

    "github.com/aws/aws-sdk-go-v2/config"
    "github.com/aws/aws-sdk-go-v2/service/iam"
)

// IAMDetachRolePolicyAPI defines the interface for the DetachRolePolicy function.
// We use this interface to test the function using a mocked service.
type IAMDetachRolePolicyAPI interface {
    DetachRolePolicy(ctx context.Context,
        params *iam.DetachRolePolicyInput,
```

```
    optFns ...func(*iam.Options)) (*iam.DetachRolePolicyOutput, error)
}

// DetachDynamoFullPolicy detaches an Amazon DynamoDB full-access policy from an AWS
// Identity and Access Management (IAM) role.
// Inputs:
//   c is the context of the method call, which includes the AWS Region.
//   api is the interface that defines the method call.
//   input defines the input arguments to the service call.
// Output:
//   If successful, a DetachRolePolicyOutput object containing the result of the
//   service call and nil.
//   Otherwise, nil and an error from the call to DetachRolePolicy.
func DetachDynamoFullPolicy(c context.Context, api IAMDetachRolePolicyAPI, input
    *iam.DetachRolePolicyInput) (*iam.DetachRolePolicyOutput, error) {
    return api.DetachRolePolicy(c, input)
}

func main() {
    roleName := flag.String("r", "", "The name of the IAM role")
    flag.Parse()

    if *roleName == "" {
        fmt.Println("You must supply a role name (-r ROLE)")
        return
    }

    cfg, err := config.LoadDefaultConfig(context.TODO())
    if err != nil {
        panic("configuration error, " + err.Error())
    }

    client := iam.NewFromConfig(cfg)

if err != nil {
    panic("Couldn't get list of policies! " + err.Error())
}
```

```
fmt.Println("PolicyName\tARN")
for _, policy := range policyListResponse.Policies {
    fmt.Printf("%s\t%s\n", *policy.PolicyName, *policy.Arn)
}
```

- For API details, see [ListPolicies](#) in *AWS SDK for Go API Reference*.

### List policies attached to a role

The following code example shows how to list policies attached to an IAM role.

#### SDK for Go V2

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// ListAttachedRolePolicies

attachedPoliciesList, err := service.ListAttachedRolePolicies(context.Background(),
    &iam.ListAttachedRolePoliciesInput{
        RoleName: aws.String(ExampleRoleName),
    })

if err != nil {
    panic("Couldn't call ListAttachedRolePolicies: " + err.Error())
}

fmt.Println("## List attached role policies for " + ExampleRoleName)

for _, attachedPolicy := range attachedPoliciesList.AttachedPolicies {
    fmt.Printf("attached policy: %v\n (%v) \n", attachedPolicy.PolicyArn,
        attachedPolicy.PolicyName)
}
```

- For API details, see [ListAttachedRolePolicies](#) in *AWS SDK for Go API Reference*.

### List roles

The following code example shows how to list IAM roles.

#### SDK for Go V2

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// ListRoles

roles, err := service.ListRoles(context.Background(), &iam.ListRolesInput{})

if err != nil {
    panic("Could not list roles: " + err.Error())
}
```

```
fmt.Println("## list roles")
for _, idxRole := range roles.Roles {
    fmt.Printf("%s\t%s\t%s\t",
        *idxRole.RoleId,
        *idxRole.RoleName,
        *idxRole.Arn)
    if idxRole.Description != nil {
        fmt.Print(*idxRole.Description)
    }
    fmt.Println("\n")
}
```

- For API details, see [ListRoles](#) in *AWS SDK for Go API Reference*.

## List users

The following code example shows how to list IAM users.

### SDK for Go V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// ListUsers

fmt.Println("## List users")

userListResult, err := service.ListUsers(context.Background(), &iam.ListUsersInput{})
if err != nil {
    panic("Couldn't list users: " + err.Error())
}
for _, userResult := range userListResult.Users {
    fmt.Printf("%s\t%s\n", *userResult.UserName, *userResult.Arn)
}
```

- For API details, see [ListUsers](#) in *AWS SDK for Go API Reference*.

## Update a user

The following code example shows how to update an IAM user.

### SDK for Go V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
package main

if err != nil {
    fmt.Println("Error", err)
    return
}

fmt.Println("Access Key activated")
```

- For API details, see [UpdateAccessKey](#) in *AWS SDK for Go API Reference*.

## Scenarios

### Create a user and assume a role

The following code example shows how to:

- Create a user who has no permissions.
- Create a role that grants permission to list Amazon S3 buckets for the account.
- Add a policy to let the user assume the role.
- Assume the role and list Amazon S3 buckets using temporary credentials.
- Delete the policy, role, and user.

### SDK for Go V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```

)

/*
This is a basic scenario for using AWS Identity and Access Management (IAM) and AWS
Security Token Service (STS).

This example will do the following:
* Create a user that has no permissions.
* Create a role and policy that grant s3>ListAllMyBuckets permission.

```

```
*   Grant the user permission to assume the role.
*   Create an S3 client object as the user and try to list buckets (this should fail).
*   Get temporary credentials by assuming the role.
*   Create an S3 client object with the temporary credentials and list the buckets
(this should succeed).
*   Delete all the resources.

*/

## AWS KMS examples using SDK for Go V2

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Go V2 with AWS Key Management Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2773\)](#)

## Actions

### Create a key

The following code example shows how to create an AWS KMS key.

#### SDK for Go V2

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
package main

import (
    "context"
    "fmt"

    "github.com/aws/aws-sdk-go-v2/config"
    "github.com/aws/aws-sdk-go-v2/service/kms"
)

// KMSCreateKeyAPI defines the interface for the CreateKey function.
// We use this interface to test the function using a mocked service.
type KMSCreateKeyAPI interface {
    CreateKey(ctx context.Context,
        params *kms.CreateKeyInput,
        optFns ...func(*kms.Options)) (*kms.CreateKeyOutput, error)
}

// MakeKey creates an AWS Key Management Service (AWS KMS) key (KMS key).
// Inputs:
//     c is the context of the method call, which includes the AWS Region.
//     api is the interface that defines the method call.
//     input defines the input arguments to the service call.
// Output:
//     If success, a CreateKeyOutput object containing the result of the service call
//     and nil.
//     Otherwise, nil and an error from the call to CreateKey.
func MakeKey(c context.Context, api KMSCreateKeyAPI, input *kms.CreateKeyInput)
    (*kms.CreateKeyOutput, error) {
    return api.CreateKey(c, input)
}

func main() {
    cfg, err := config.LoadDefaultConfig(context.TODO())
    if err != nil {
        panic("configuration error, " + err.Error())
    }

    client := kms.NewFromConfig(cfg)

    input := &kms.CreateKeyInput{}

    result, err := MakeKey(context.TODO(), client, input)
    if err != nil {
```

```
    fmt.Println("Got error creating key:")
    fmt.Println(err)
    return
}

fmt.Println(*result.KeyMetadata.KeyId)
}
```

## Amazon S3 examples using SDK for Go V2

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for Go V2 with Amazon Simple Storage Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2778\)](#)
- [Scenarios \(p. 2784\)](#)

## Actions

### Copy an object from one bucket to another

The following code example shows how to copy an S3 object from one bucket to another.

#### SDK for Go V2

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Copy an object to another name.

// CopyObject is "Pull an object from the source bucket + path".
// The semantics of CopySource varies depending on whether you're using Amazon S3 on
// Outposts,
// or through access points.
// See https://docs.aws.amazon.com/AmazonS3/latest/API/
API_CopyObject.html#API_CopyObject_RequestSyntax
fmt.Println("Copy an object from another bucket to our bucket.")
_, err = client.CopyObject(context.TODO(), &s3.CopyObjectInput{
    Bucket:    aws.String(name),
    CopySource: aws.String(name + "/path/myfile.jpg"),
    Key:       aws.String("other/file.jpg"),
})

if err != nil {
    panic("Couldn't copy the object to a new key")
}
```

- For API details, see [CopyObject](#) in *AWS SDK for Go API Reference*.

## Create a bucket

The following code example shows how to create an S3 bucket.

### SDK for Go V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Create a bucket: We're going to create a bucket to hold content.  
// Best practice is to use the preset private access control list (ACL).  
// If you are not creating a bucket from us-east-1, you must specify a bucket location  
constraint.  
// Bucket names must conform to several rules; read more at https://  
docs.aws.amazon.com/AmazonS3/latest/userguide/bucketnamingrules.html  
_, err := client.CreateBucket(context.TODO(), &s3.CreateBucketInput{  
    Bucket: aws.String(name),

for _, bucket := range listBucketsResult.Buckets {
    fmt.Printf("Bucket name: %s\t\tcreated at: %v\n", *bucket.Name, bucket.CreationDate)
}
```

- For API details, see [ListBuckets](#) in *AWS SDK for Go API Reference*.

## List objects in a bucket

The following code example shows how to list objects in an S3 bucket.

### SDK for Go V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// List objects in the bucket.
// n.b. object keys in Amazon S3 do not begin with '/'. You do not need to lead your
// prefix with it.
fmt.Println("Listing the objects in the bucket:")
listObjsResponse, err := client.ListObjectsV2(context.TODO(), &s3.ListObjectsV2Input{
    Bucket: aws.String(name),
    Prefix: aws.String(""),
})

if err != nil {
    panic("Couldn't list bucket contents")
}

for _, object := range listObjsResponse.Contents {
    fmt.Printf("%s (%d bytes, class %v) \n", *object.Key, object.Size,
    object.StorageClass)
}
```

- For API details, see [ListObjects](#) in *AWS SDK for Go API Reference*.

## Upload an object to a bucket

The following code example shows how to upload an object to an S3 bucket.

### SDK for Go V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Place an object in a bucket.
fmt.Println("Upload an object to the bucket")
// Get the object body to upload.
// Image credit: https://unsplash.com/photos/iz58d89q3ss
stat, err := os.Stat("image.jpg")
if err != nil {
    panic("Couldn't stat image: " + err.Error())
}
file, err := os.Open("image.jpg")

if err != nil {
    panic("Couldn't open local file")
}

_, err = client.PutObject(context.TODO(), &s3.PutObjectInput{
    Bucket:      aws.String(name),
    Key:         aws.String("path/myfile.jpg"),
    Body:         file,
    ContentLength: stat.Size(),
})
file.Close()

if err != nil {
    panic("Couldn't upload file: " + err.Error())
}
```

- For API details, see [PutObject](#) in *AWS SDK for Go API Reference*.

## Scenarios

### Create a presigned URL

The following code example shows how to create a presigned URL for S3 and upload an object.

### SDK for Go V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Get a presigned URL for the object.
// In order to get a presigned URL for an object, you must
```

```
// create a Presignclient
fmt.Println("Create Presign client")
presignClient := s3.NewPresignClient(&client)

presignParams := &s3.GetObjectInput{
    Bucket: aws.String(name),
    Key:    aws.String("path/myfile.jpg"),
}

// Apply an expiration via an option function
presignDuration := func(po *s3.PresignOptions) {
    po.Expires = 5 * time.Minute
}

presignResult, err := presignClient.PresignGetObject(context.TODO(), presignParams,
presignDuration)

if err != nil {
    panic("Couldn't get presigned URL for GetObject")
}

fmt.Printf("Presigned URL For object: %s\n", presignResult.URL)
```

## Get started with buckets and objects

The following code example shows how to:

- Create a bucket.
- Upload a file to the bucket.
- Download an object from a bucket.
- Copy an object to a subfolder in a bucket.
- List the objects in a bucket.
- Delete the objects in a bucket.
- Delete a bucket.

## SDK for Go V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// This bucket name is 100% unique.
// Remember that bucket names must be globally unique among all buckets.

myBucketName := "mybucket-" + (xid.New().String())
fmt.Printf("Bucket name: %v\n", myBucketName)

cfg, err := config.LoadDefaultConfig(context.TODO())

if err != nil {
    panic("Failed to load configuration")
}

s3client := s3.NewFromConfig(cfg)

## Get the URL of a queue

The following code example shows how to get the URL of an Amazon SQS queue.

### SDK for Go V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Get the URL for an Amazon SQS queue.

```
package main

import (
    "context"
    "flag"
    "fmt"

    "github.com/aws/aws-sdk-go-v2/config"
    "github.com/aws/aws-sdk-go-v2/service/sqs"
)

// SQSGetQueueUrlAPI defines the interface for the GetQueueUrl function.
// We use this interface to test the function using a mocked service.
type SQSGetQueueUrlAPI interface {
    GetQueueUrl(ctx context.Context,
```

```
    params *sqsc.GetQueueUrlInput,
    optFns ...func(*sqsc.Options)) (*sqsc.GetQueueUrlOutput, error)
}

// GetQueueURL gets the URL of an Amazon SQS queue.
// Inputs:
//   c is the context of the method call, which includes the AWS Region.
//   api is the interface that defines the method call.
//   input defines the input arguments to the service call.
// Output:
//   If success, a GetQueueUrlOutput object containing the result of the service call
//   and nil.
//   Otherwise, nil and an error from the call to GetQueueUrl.
func GetQueueURL(c context.Context, api SQSGetQueueUrlAPI, input *sqsc.GetQueueUrlInput)
(*sqsc.GetQueueUrlOutput, error) {
    return api.GetQueueUrl(c, input)
}

func main() {
    queue := flag.String("q", "", "The name of the queue")
    flag.Parse()

    if *queue == "" {
        fmt.Println("You must supply a queue name (-q QUEUE)")
        return
    }

    cfg, err := config.LoadDefaultConfig(context.TODO())
    if err != nil {
        panic("configuration error, " + err.Error())
    }

    client := sqs.NewFromConfig(cfg)

    input := &sqsc.GetQueueUrlInput{
        QueueName: queue,
    }

    result, err := GetQueueURL(context.TODO(), client, input)
    if err != nil {
        fmt.Println("Got an error getting the queue URL:")
        fmt.Println(err)
        return
    }

    fmt.Println("URL: " + *result.QueueUrl)
}
```

- For API details, see [GetQueueUrl](#) in *AWS SDK for Go API Reference*.

## List queues

The following code example shows how to list Amazon SQS queues.

### SDK for Go V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

List your Amazon SQS queues.

```
package main

import (
    "context"
    "fmt"

    "github.com/aws/aws-sdk-go-v2/config"
    "github.com/aws/aws-sdk-go-v2/service/sqs"
)

// SQSListQueuesAPI defines the interface for the ListQueues function.
// We use this interface to test the function using a mocked service.
type SQSListQueuesAPI interface {
    ListQueues(ctx context.Context,
        params *sqs.ListQueuesInput,
        optFns ...func(*sqs.Options)) (*sqs.ListQueuesOutput, error)
}

// GetQueues retrieves a list of your Amazon Simple Queue Service (Amazon SQS) queues.
// Inputs:
//     c is the context of the method call, which includes the AWS Region.
//     api is the interface that defines the method call.
//     input defines the input arguments to the service call.
// Output:
//     If success, a ListQueuesOutput object containing the result of the service call
//     and nil.
//     Otherwise, nil and an error from the call to ListQueues.
func GetQueues(c context.Context, api SQSListQueuesAPI, input *sqs.ListQueuesInput) (*sqs.ListQueuesOutput, error) {
    return api.ListQueues(c, input)
}

func main() {
    cfg, err := config.LoadDefaultConfig(context.TODO())
    if err != nil {
        panic("configuration error, " + err.Error())
    }

    client := sqs.NewFromConfig(cfg)

    input := &sqs.ListQueuesInput{}

    result, err := GetQueues(context.TODO(), client, input)
    if err != nil {
        fmt.Println("Got an error retrieving queue URLs:")
        fmt.Println(err)
        return
    }

    for i, url := range result.QueueUrls {
        fmt.Printf("%d: %s\n", i+1, url)
    }
}
```

- For API details, see [ListQueues](#) in *AWS SDK for Go API Reference*.

## Receive messages from a queue

The following code example shows how to receive messages from an Amazon SQS queue.

## SDK for Go V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Receive a message from an Amazon SQS queue.

```
package main

import (
    "context"
    "flag"
    "fmt"

    "github.com/aws/aws-sdk-go-v2/config"
    "github.com/aws/aws-sdk-go-v2/service/sqs"
    "github.com/aws/aws-sdk-go-v2/service/sqs/types"
)

// SQSReceiveMessageAPI defines the interface for the GetQueueUrl function.

# Code examples for SDK for JavaScript V2

The code examples in this topic show you how to use the AWS SDK for JavaScript V2 with AWS.

## Examples

- [Single-service actions and scenarios using SDK for JavaScript V2 \(p. 2801\)](#)
- [Cross-service examples using SDK for JavaScript V2 \(p. 2909\)](#)

## Single-service actions and scenarios using SDK for JavaScript V2

The following code examples show how to perform actions and implement common scenarios by using the AWS SDK for JavaScript V2 with AWS services.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

## Services

- [CloudWatch examples using SDK for JavaScript V2 \(p. 2801\)](#)
- [CloudWatch Events examples using SDK for JavaScript V2 \(p. 2813\)](#)
- [CloudWatch Logs examples using SDK for JavaScript V2 \(p. 2817\)](#)
- [DynamoDB examples using SDK for JavaScript V2 \(p. 2822\)](#)
- [EventBridge examples using SDK for JavaScript V2 \(p. 2847\)](#)
- [IAM examples using SDK for JavaScript V2 \(p. 2851\)](#)
- [Amazon Pinpoint examples using SDK for JavaScript V2 \(p. 2878\)](#)
- [Amazon Pinpoint SMS and Voice API examples using SDK for JavaScript V2 \(p. 2885\)](#)
- [S3 Glacier examples using SDK for JavaScript V2 \(p. 2887\)](#)
- [Amazon SNS examples using SDK for JavaScript V2 \(p. 2890\)](#)
- [Amazon SQS examples using SDK for JavaScript V2 \(p. 2892\)](#)
- [AWS STS examples using SDK for JavaScript V2 \(p. 2907\)](#)

## CloudWatch examples using SDK for JavaScript V2

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for JavaScript V2 with Amazon CloudWatch.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

## Actions

### Create an alarm that watches a metric

The following code example shows how to create an Amazon CloudWatch alarm that watches a metric.

#### SDK for JavaScript V3

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { CloudWatchClient } from "@aws-sdk/client-cloudwatch";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon CloudWatch service client object.
export const cwClient = new CloudWatchClient({ region: REGION });
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import { PutMetricAlarmCommand } from "@aws-sdk/client-cloudwatch";
import { cwClient } from "./libs/cloudWatchClient.js";

// Set the parameters
export const params = {
  AlarmName: "Web_Server_CPU_Utilization",
  ComparisonOperator: "GreaterThanOrEqualToThreshold",
  EvaluationPeriods: 1,
  MetricName: "CPUUtilization",
  Namespace: "AWS/EC2",
  Period: 60,
  Statistic: "Average",
  Threshold: 70.0,
  ActionsEnabled: false,
  AlarmDescription: "Alarm when server CPU exceeds 70%",
  Dimensions: [
    {
      Name: "InstanceId",
      Value: "INSTANCE_ID",
    },
  ],
  Unit: "Percent",
};

export const run = async () => {
  try {
    const data = await cwClient.send(new PutMetricAlarmCommand(params));
    console.log("Success", data);
    return data;
  } catch (err) {
    console.log("Error", err);
  }
};
// Uncomment this line to run execution within this file.
// run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [PutMetricAlarm in AWS SDK for JavaScript API Reference](#).

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create CloudWatch service object
var cw = new AWS.CloudWatch({apiVersion: '2010-08-01'});

var params = {
    AlarmName: 'Web_Server_CPU_Utilization',
    ComparisonOperator: 'GreaterThanOrEqualToThreshold',
    EvaluationPeriods: 1,
    MetricName: 'CPUUtilization',
    Namespace: 'AWS/EC2',
    Period: 60,
    Statistic: 'Average',
    Threshold: 70.0,
    ActionsEnabled: false,
    AlarmDescription: 'Alarm when server CPU exceeds 70%',
    Dimensions: [
        {
            Name: 'InstanceId',
            Value: 'INSTANCE_ID'
        },
    ],
    Unit: 'Percent'
};

cw.putMetricAlarm(params, function(err, data) {
    if (err) {
        console.log("Error", err);
    } else {
        console.log("Success", data);
    }
});
```

- For API details, see [PutMetricAlarm in AWS SDK for JavaScript API Reference](#).

## Delete alarms

The following code example shows how to delete Amazon CloudWatch alarms.

## SDK for JavaScript V3

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { CloudWatchClient } from "@aws-sdk/client-cloudwatch";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon CloudWatch service client object.
export const cwClient = new CloudWatchClient({ region: REGION });
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import { DeleteAlarmsCommand } from "@aws-sdk/client-cloudwatch";
import { cwClient } from "./libs/cloudWatchClient.js";

// Set the parameters
export const params = { AlarmNames: "ALARM_NAME" }; // e.g.,
  "Web_Server_CPU_Utilization"

export const run = async () => {
  try {
    const data = await cwClient.send(new DeleteAlarmsCommand(params));
    console.log("Success, alarm deleted; requestID:", data);
    return data;
  } catch (err) {
    console.log("Error", err);
  }
};

// Uncomment this line to run execution within this file.
// run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [DeleteAlarms](#) in [AWS SDK for JavaScript API Reference](#).

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Import the SDK and client modules and call the API.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create CloudWatch service object
var cw = new AWS.CloudWatch({apiVersion: '2010-08-01'});

var params = {
  AlarmNames: ['Web_Server_CPU_Utilization']
};

cw.deleteAlarms(params, function(err, data) {
  if (err) {
```

```
    console.log("Error", err);
} else {
    console.log("Success", data);
}
});
```

## Describe alarms for a metric

The following code example shows how to describe Amazon CloudWatch alarms for a metric.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { CloudWatchClient } from "@aws-sdk/client-cloudwatch";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon CloudWatch service client object.
export const cwClient = new CloudWatchClient({ region: REGION });
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import { DescribeAlarmsCommand } from "@aws-sdk/client-cloudwatch";
import { cwClient } from "./libs/cloudWatchClient.js";

// Set the parameters
export const params = { StateValue: "INSUFFICIENT_DATA" };

export const run = async () => {
    try {
        const data = await cwClient.send(new DescribeAlarmsCommand(params));
        console.log("Success", data);
        data.MetricAlarms.forEach(function (item) {
            console.log(item.AlarmName);
        });
        return data;
    } catch (err) {
        console.log("Error", err);
    }
};
// Uncomment this line to run execution within this file.
// run();
```

## Disable alarm actions

The following code example shows how to disable Amazon CloudWatch alarm actions.

## SDK for JavaScript V3

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { CloudWatchClient } from "@aws-sdk/client-cloudwatch";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon CloudWatch service client object.
export const cwClient = new CloudWatchClient({ region: REGION });
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import { DisableAlarmActionsCommand } from "@aws-sdk/client-cloudwatch";
import { cwClient } from "./libs/cloudWatchClient.js";

// Set the parameters
export const params = { AlarmNames: "ALARM_NAME" }; // e.g.,
  "Web_Server_CPU_Utilization"
```

```
export const run = async () => {
  try {
    const data = await cwClient.send(new DisableAlarmActionsCommand(params));
    console.log("Success, alarm disabled:", data);
    return data;
  } catch (err) {
    console.log("Error", err);
  }
};
// Uncomment this line to run execution within this file.
// run();
```

### Enable alarm actions

The following code example shows how to enable Amazon CloudWatch alarm actions.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { CloudWatchClient } from "@aws-sdk/client-cloudwatch";
// Set the AWS Region.
```

```
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon CloudWatch service client object.
export const cwClient = new CloudWatchClient({ region: REGION });
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import {
  PutMetricAlarmCommand,
  EnableAlarmActionsCommand,
} from "@aws-sdk/client-cloudwatch";
import { cwClient } from "./libs/cloudWatchClient.js";

// Set the parameters
export const params = {
  AlarmName: "ALARM_NAME", //ALARM_NAME
  ComparisonOperator: "GreaterThanOrEqualToThreshold",
  EvaluationPeriods: 1,
  MetricName: "CPUUtilization",
  Namespace: "AWS/EC2",
  Period: 60,
  Statistic: "Average",
  Threshold: 70.0,
  ActionsEnabled: true,
  AlarmActions: ["ACTION_ARN"], //e.g., "arn:aws:automate:us-east-1:ec2:stop"
  AlarmDescription: "Alarm when server CPU exceeds 70%",
  Dimensions: [
    {
      Name: "InstanceId",
      Value: "INSTANCE_ID",
    },
  ],
  Unit: "Percent",
};

export const run = async () => {
  try {
    const data = await cwClient.send(new PutMetricAlarmCommand(params));
    console.log("Alarm action added; RequestID:", data);
    return data;
  } catch (err) {
    console.log("Error", err);
  }
  try {
    const paramsEnableAlarmAction = {
      AlarmNames: [params.AlarmName],
    };
    const data = await cwClient.send(
      new EnableAlarmActionsCommand(paramsEnableAlarmAction)
    );
    console.log("Alarm action enabled; RequestID:", data.$metadata.requestId);
  } catch (err) {
    console.log("Error", err);
  }
};
// Uncomment this line to run execution within this file.
// run();
```

## Actions

### Create a subscription filter

The following code example shows how to create an Amazon CloudWatch Logs subscription filter.

#### SDK for JavaScript V3

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { CloudWatchLogsClient } from "@aws-sdk/client-cloudwatch-logs";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon CloudWatch Logs service client object.
export const cwlClient = new CloudWatchLogsClient({ region: REGION });
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import {
  PutSubscriptionFilterCommand,
} from "@aws-sdk/client-cloudwatch-logs";
import { cwlClient } from "./libs/cloudWatchLogsClient.js";

// Set the parameters
export const params = {
  destinationArn: "LAMBDA_FUNCTION_ARN", //LAMBDA_FUNCTION_ARN
  filterName: "FILTER_NAME", //FILTER_NAME
  filterPattern: "ERROR",
  logGroupName: "LOG_GROUP", //LOG_GROUP
};

export const run = async () => {
  try {
    const data = await cwlClient.send(new PutSubscriptionFilterCommand(params));
    console.log("Success", data.subscriptionFilters);
    return data; //For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
// Uncomment this line to run execution within this file.
// run();
```

## Delete a subscription filter

The following code example shows how to delete an Amazon CloudWatch Logs subscription filter.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { CloudWatchLogsClient } from "@aws-sdk/client-cloudwatch-logs";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon CloudWatch Logs service client object.
export const cwlClient = new CloudWatchLogsClient({ region: REGION });
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import {
  DeleteSubscriptionFilterCommand
} from "@aws-sdk/client-cloudwatch-logs";
import { cwlClient } from "./libs/cloudWatchLogsClient.js";

// Set the parameters
export const params = {
  filterName: "FILTER", //FILTER
  logGroupName: "LOG_GROUP", //LOG_GROUP
};

export const run = async () => {
```

```
try {
  const data = await cwlClient.send(
    new DeleteSubscriptionFilterCommand(params)
  );
  console.log(
    "Success, subscription filter deleted",
    data
  );
  return data; //For unit tests.
} catch (err) {
  console.log("Error", err);
}
};

// Uncomment this line to run execution within this file.
// run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [DeleteSubscriptionFilter](#) in [AWS SDK for JavaScript API Reference](#).

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create the CloudWatchLogs service object
var cwl = new AWS.CloudWatchLogs({apiVersion: '2014-03-28'});

var params = {
  filterName: 'FILTER',
  logGroupName: 'LOG_GROUP'
};

cwl.deleteSubscriptionFilter(params, function(err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data);
  }
});
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [DeleteSubscriptionFilter](#) in [AWS SDK for JavaScript API Reference](#).

## Describe existing subscription filters

The following code example shows how to describe Amazon CloudWatch Logs existing subscription filters.

## SDK for JavaScript V3

### Note

## DynamoDB examples using SDK for JavaScript V2

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for JavaScript V2 with Amazon DynamoDB.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2822\)](#)

## Actions

### Create a table

The following code example shows how to create a DynamoDB table.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon DynamoDB service client object.
const ddbClient = new DynamoDBClient({ region: REGION });
export { ddbClient };
```

Create the table.

```
// Import required AWS SDK clients and commands for Node.js
import { CreateTableCommand } from "@aws-sdk/client-dynamodb";
import { ddbClient } from "./libs/ddbClient.js";

// Set the parameters
export const params = {
    AttributeDefinitions: [
        {
            AttributeName: "Season", //ATTRIBUTE_NAME_1
```

```
        AttributeType: "N", //ATTRIBUTE_TYPE
    },
    {
        AttributeName: "Episode", //ATTRIBUTE_NAME_2
        AttributeType: "N", //ATTRIBUTE_TYPE
    },
],
KeySchema: [
    {
        AttributeName: "Season", //ATTRIBUTE_NAME_1
        KeyType: "HASH",
    },
    {
        AttributeName: "Episode", //ATTRIBUTE_NAME_2
        KeyType: "RANGE",
    },
],
ProvisionedThroughput: {
    ReadCapacityUnits: 1,
    WriteCapacityUnits: 1,
},
TableName: "TEST_TABLE", //TABLE_NAME
StreamSpecification: {
    StreamEnabled: false,
},
};

export const run = async () => {
    try {
        const data = await ddbClient.send(new CreateTableCommand(params));
        console.log("Table Created", data);
        return data;
    } catch (err) {
        console.log("Error", err);
    }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [CreateTable](#) in [AWS SDK for JavaScript API Reference](#).

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create the DynamoDB service object
var ddb = new AWS.DynamoDB({apiVersion: '2012-08-10'});

var params = {
    AttributeDefinitions: [
        {
            AttributeName: 'CUSTOMER_ID',
            AttributeType: 'N'
        },
        {
            AttributeName: 'CUSTOMER_NAME',
            AttributeType: 'S'
        }
    ],
    KeySchema: [
        {
            AttributeName: "CustomerID", //ATTRIBUTE_NAME_1
            KeyType: "HASH"
        },
        {
            AttributeName: "CustomerName", //ATTRIBUTE_NAME_2
            KeyType: "RANGE"
        }
    ],
    ProvisionedThroughput: {
        ReadCapacityUnits: 1,
        WriteCapacityUnits: 1
    }
};
```

```
        AttributeType: 'S'
    },
],
KeySchema: [
    {
        AttributeName: 'CUSTOMER_ID',
        KeyType: 'HASH'
    },
    {
        AttributeName: 'CUSTOMER_NAME',
        KeyType: 'RANGE'
    }
],
ProvisionedThroughput: {
    ReadCapacityUnits: 1,
    WriteCapacityUnits: 1
},
TableName: 'CUSTOMER_LIST',
StreamSpecification: {
    StreamEnabled: false
}
};

// Call DynamoDB to create the table
ddb.createTable(params, function(err, data) {
    if (err) {
        console.log("Error", err);
    } else {
        console.log("Table Created", data);
    }
});
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).

## Delete a table

The following code example shows how to delete a DynamoDB table.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create the DynamoDB service client module using ES6 syntax.
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";
import { DEFAULT_REGION } from "../../../../../libs/utils/util-aws-sdk.js";
// Create an Amazon DynamoDB service client object.
export const ddbClient = new DynamoDBClient({ region: DEFAULT_REGION });
```

Delete the table.

```
// Import required AWS SDK clients and commands for Node.js
import { DeleteTableCommand } from "@aws-sdk/client-dynamodb";
import { ddbClient } from "./libs/ddbClient.js";
```

```
// Set the parameters
export const params = {
  TableName: "CUSTOMER_LIST_NEW",
};

export const run = async () => {
  try {
    const data = await ddbClient.send(new DeleteTableCommand(params));
    console.log("Success, table deleted", data);
    return data;
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For API details, see [DeleteTable](#) in *AWS SDK for JavaScript API Reference*.

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create the DynamoDB service object
var ddb = new AWS.DynamoDB({apiVersion: '2012-08-10'});

var params = {
  TableName: process.argv[2]
};

// Call DynamoDB to delete the specified table
ddb.deleteTable(params, function(err, data) {
  if (err && err.code === 'ResourceNotFoundException') {
    console.log("Error: Table not found");
  } else if (err && err.code === 'ResourceInUseException') {
    console.log("Error: Table in use");
  } else {
    console.log("Success", data);
  }
});
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [DeleteTable](#) in *AWS SDK for JavaScript API Reference*.

## Delete an item from a table

The following code example shows how to delete an item from a DynamoDB table.

## SDK for JavaScript V3

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create the DynamoDB service client module using ES6 syntax.  
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";  
import { DEFAULT_REGION } from "../../../../../libs/utils/util-aws-sdk.js";  
// Create an Amazon DynamoDB service client object.  
export const ddbClient = new DynamoDBClient({ region: DEFAULT_REGION });
```

Create the document client.

```
// Create a service client module using ES6 syntax.  
import { DynamoDBDocumentClient } from "@aws-sdk/lib-dynamodb";  
import { ddbClient } from "./ddbClient.js";  
  
const marshallOptions = {  
    // Whether to automatically convert empty strings, blobs, and sets to `null`.  
    convertEmptyValues: false, // false, by default.  
    // Whether to remove undefined values while marshalling.  
    removeUndefinedValues: true, // false, by default.  
    // Whether to convert typeof object to map attribute.  
    convertClassInstanceToMap: false, // false, by default.  
};  
  
const unmarshallOptions = {  
    // Whether to return numbers as a string instead of converting them to native  
    // JavaScript numbers.  
    wrapNumbers: false, // false, by default.  
};  
  
// Create the DynamoDB document client.  
const ddbDocClient = DynamoDBDocumentClient.from(ddbClient, {  
    marshallOptions,  
    unmarshallOptions,  
});  
  
export { ddbDocClient };
```

Delete an item from a table using the DynamoDB document client.

```
import { DeleteCommand } from "@aws-sdk/lib-dynamodb";  
import { ddbDocClient } from "../../libs/ddbDocClient.js";  
  
// Set the parameters.  
export const params = {  
    TableName: "TABLE_NAME",  
    Key: {  
        primaryKey: "VALUE_1",  
        sortKey: "VALUE_2",  
    },  
};  
  
export const deleteItem = async () => {  
    try {  
        await ddbDocClient.send(new DeleteCommand(params));  
        console.log("Success - item deleted");  
    } catch (err) {  
        console.log("Error", err);  
    }  
};
```

```
deleteItem();
```

Delete an item from a table using PartiQL.

```
// Import required AWS SDK clients and commands for Node.js.
import { ExecuteStatementCommand } from "@aws-sdk/client-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";

const tableName = process.argv[2];
const movieYear1 = process.argv[3];
const movieTitle1 = process.argv[4];

export const run = async (tableName, movieYear1, movieTitle1) => {
  const params = {
    Statement: "DELETE FROM " + tableName + " where title=? and year=?",
    Parameters: [{ S: movieTitle1 }, { N: movieYear1 }],
  };
  try {
    await ddbDocClient.send(new ExecuteStatementCommand(params));
    console.log("Success. Item deleted.");
    return "Run successfully"; // For unit tests.
  } catch (err) {
    console.error(err);
  }
};
run(tableName, movieYear1, movieTitle1);
```

Delete an item from a table by batch using PartiQL.

```
// Import required AWS SDK clients and commands for Node.js.
import { BatchExecuteStatementCommand } from "@aws-sdk/client-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";

const tableName = process.argv[2];
const movieYear1 = process.argv[3];
const movieTitle1 = process.argv[4];
const movieYear2 = process.argv[5];
const movieTitle2 = process.argv[6];

export const run = async (
  tableName,
  movieYear1,
  movieTitle1,
  movieYear2,
  movieTitle2
) => {
  try {
    const params = {
      Statements: [
        {
          Statement: "DELETE FROM " + tableName + " where year=? and title=?",
          Parameters: [{ N: movieYear1 }, { S: movieTitle1 }],
        },
        {
          Statement: "DELETE FROM " + tableName + " where year=? and title=?",
          Parameters: [{ N: movieYear2 }, { S: movieTitle2 }],
        },
      ],
    };
    const data = await ddbDocClient.send(
```

```
        new BatchExecuteStatementCommand(params)
    );
    console.log("Success. Items deleted.", data);
    return "Run successfully"; // For unit tests.
} catch (err) {
    console.error(err);
}
};

run(tableName, movieYear1, movieTitle1, movieYear2, movieTitle2);
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Delete an item from a table.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create the DynamoDB service object
var ddb = new AWS.DynamoDB({apiVersion: '2012-08-10'});

var params = {
    TableName: 'TABLE',
    Key: {
        'KEY_NAME': {N: 'VALUE'}
    }
};

// Call DynamoDB to delete the item from the table
ddb.deleteItem(params, function(err, data) {
    if (err) {
        console.log("Error", err);
    } else {
        console.log("Success", data);
    }
});
```

Delete an item from a table using the DynamoDB document client.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create DynamoDB document client
var docClient = new AWS.DynamoDB.DocumentClient({apiVersion: '2012-08-10'});

var params = {
    Key: {
        'HASH_KEY': VALUE
    },
    TableName: 'TABLE'
};
```

```
docClient.delete(params, function(err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data);
  }
});
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [DeleteItem](#) in *AWS SDK for JavaScript API Reference*.

## Get a batch of items

The following code example shows how to get a batch of DynamoDB items.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon DynamoDB service client object.
const ddbClient = new DynamoDBClient({ region: REGION });
export { ddbClient };
```

Get the items.

```
// Import required AWS SDK clients and commands for Node.js
import { BatchGetItemCommand } from "@aws-sdk/client-dynamodb";
import { ddbClient } from "./libs/ddbClient.js";

// Set the parameters
export const params = {
  RequestItems: {
    TABLE_NAME: {
      Keys: [
        {
          KEY_NAME_1: { N: "KEY_VALUE" },
          KEY_NAME_2: { N: "KEY_VALUE" },
          KEY_NAME_3: { N: "KEY_VALUE" },
        },
      ],
      ProjectionExpression: "ATTRIBUTE_NAME",
    },
  },
};

export const run = async () => {
  try {
    const data = await ddbClient.send(new BatchGetItemCommand(params));
    console.log("Success, items retrieved", data);
    return data;
  } catch (err) {
```

```
        console.log("Error", err);
    }
};

run();
```

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Get an item from a table.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create the DynamoDB service object
var ddb = new AWS.DynamoDB({apiVersion: '2012-08-10'});

var params = {
  TableName: 'TABLE',
  Key: {
    'KEY_NAME': {N: '001'}
  },
  ProjectionExpression: 'ATTRIBUTE_NAME'
};

// Call DynamoDB to read the item from the table
ddb.getItem(params, function(err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data.Item);
  }
});
```

Get an item from a table using the DynamoDB document client.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});
```

```
// Create DynamoDB document client
var docClient = new AWS.DynamoDB.DocumentClient({apiVersion: '2012-08-10'});

var params = {
  TableName: 'EPISODES_TABLE',
  Key: {'KEY_NAME': VALUE}
};

docClient.get(params, function(err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data.Item);
  }
});
```

## Get information about a table

The following code example shows how to get information about a DynamoDB table.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon DynamoDB service client object.
const ddbClient = new DynamoDBClient({ region: REGION });
export { ddbClient };
```

Describe the table.

```
// Import required AWS SDK clients and commands for Node.js
import { DescribeTableCommand } from "@aws-sdk/client-dynamodb";
import { ddbClient } from "./libs/ddbClient.js";

// Set the parameters
export const params = { TableName: "TABLE_NAME" }; //TABLE_NAME

export const run = async () => {
  try {
    const data = await ddbClient.send(new DescribeTableCommand(params));
    console.log("Success", data);
    // console.log("Success", data.Table.KeySchema);
    return data;
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

### Put an item in a table

The following code example shows how to put an item in a DynamoDB table.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create the DynamoDB service client module using ES6 syntax.
```

```
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";
import { DEFAULT_REGION } from "../../../../../libs/utils/util-aws-sdk.js";
// Create an Amazon DynamoDB service client object.
export const ddbClient = new DynamoDBClient({ region: DEFAULT_REGION });
```

Create the DynamoDB document client.

```
// Create a service client module using ES6 syntax.
import { DynamoDBDocumentClient } from "@aws-sdk/lib-dynamodb";
import { ddbClient } from "./ddbClient.js";

const marshallOptions = {
    // Whether to automatically convert empty strings, blobs, and sets to `null`.
    convertEmptyValues: false, // false, by default.
    // Whether to remove undefined values while marshalling.
    removeUndefinedValues: true, // false, by default.
    // Whether to convert typeof object to map attribute.
    convertClassInstanceToMap: false, // false, by default.
};

const unmarshallOptions = {
    // Whether to return numbers as a string instead of converting them to native
    // JavaScript numbers.
    wrapNumbers: false, // false, by default.
};

// Create the DynamoDB document client.
const ddbDocClient = DynamoDBDocumentClient.from(ddbClient, {
    marshallOptions,
    unmarshallOptions,
});

export { ddbDocClient };
```

Put an item in a table using the DynamoDB document client.

```
import { PutCommand } from "@aws-sdk/lib-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";

export const putItem = async () => {
    // Set the parameters.
    export const params = {
        TableName: "TABLE_NAME",
        Item: {
            primaryKey: "VALUE_1",
            sortKey: "VALUE_2",
        },
    };
    try {
        const data = await ddbDocClient.send(new PutCommand(params));
        console.log("Success - item added or updated", data);
    } catch (err) {
        console.log("Error", err.stack);
    }
};
putItem();
```

Put an item in a table using PartiQL.

```
// Import required AWS SDK clients and commands for Node.js.
import { ExecuteStatementCommand } from "@aws-sdk/client-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";

const tableName = process.argv[2];
const movieYear1 = process.argv[3];
const movieTitle1 = process.argv[4];

export const run = async (tableName, movieTitle1, movieYear1) => {
    const params = {
        Statement: "INSERT INTO " + tableName + " value {'title':?, 'year':?}",
        Parameters: [{ S: movieTitle1 }, { N: movieYear1 }],
    };
    try {
        await ddbDocClient.send(new ExecuteStatementCommand(params));
        console.log("Success. Item added.");
        return "Run successfully"; // For unit tests.
    } catch (err) {
        console.error(err);
    }
};
run(tableName, movieTitle1, movieYear1);
```

Put items by batch in a table using PartiQL.

```
// Import required AWS SDK clients and commands for Node.js.
import { BatchExecuteStatementCommand } from "@aws-sdk/client-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";

const tableName = process.argv[2];
const movieYear1 = process.argv[3];
const movieTitle1 = process.argv[4];
const movieYear2 = process.argv[5];
const movieTitle2 = process.argv[6];

export const run = async (
    tableName,
    movieYear1,
    movieTitle1,
    movieYear2,
    movieTitle2
) => {
    const params = {
        Statements: [
            {
                Statement:
                    "INSERT INTO " + tableName + " value {'title':?, 'year':?}",
                Parameters: [{ S: movieTitle1 }, { N: movieYear1 }],
            },
            {
                Statement:
                    "INSERT INTO " + tableName + " value {'title':?, 'year':?}",
                Parameters: [{ S: movieTitle2 }, { N: movieYear2 }],
            },
        ],
    };
    try {
        await ddbDocClient.send(
            new BatchExecuteStatementCommand(params)
        );
        console.log("Success. Items added.");
    } catch (err) {
        console.error(err);
    }
};
```

```
        return "Run successfully"; // For unit tests.
    } catch (err) {
        console.error(err);
    }
};

run(tableName, movieYear1, movieTitle1, movieYear2, movieTitle2);
```

- For API details, see [PutItem](#) in *AWS SDK for JavaScript API Reference*.

## SDK for JavaScript V2

### Note

Put an item in a table.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create the DynamoDB service object
var ddb = new AWS.DynamoDB({apiVersion: '2012-08-10'});

var params = {
    TableName: 'CUSTOMER_LIST',
    Item: {
        'CUSTOMER_ID' : {N: '001'},
        'CUSTOMER_NAME' : {S: 'Richard Roe'}
    }
};

// Call DynamoDB to add the item to the table
ddb.putItem(params, function(err, data) {
    if (err) {
        console.log("Error", err);
    } else {
        console.log("Success", data);
    }
});
```

Put an item in a table using the DynamoDB document client.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create DynamoDB document client
var docClient = new AWS.DynamoDB.DocumentClient({apiVersion: '2012-08-10'});

var params = {
    TableName: 'TABLE',
    Item: {
        'HASHKEY': VALUE,
        'ATTRIBUTE_1': 'STRING_VALUE',
        'ATTRIBUTE_2': VALUE_2
    }
};
```

```
docClient.put(params, function(err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data);
  }
});
```

## Query a table

The following code example shows how to query a DynamoDB table.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon DynamoDB service client object.
const ddbClient = new DynamoDBClient({ region: REGION });
export { ddbClient };
```

Query the table.

```
// Import required AWS SDK clients and commands for Node.js
import { QueryCommand } from "@aws-sdk/client-dynamodb";
import { ddbClient } from "./libs/ddbClient.js";

// Set the parameters
export const params = {
  KeyConditionExpression: "Season = :s and Episode > :e",
  FilterExpression: "contains (Subtitle, :topic)",
  ExpressionAttributeValues: {
    ":s": { N: "1" },
    ":e": { N: "2" },
    ":topic": { S: "SubTitle" },
  },
  ProjectionExpression: "Episode, Title, Subtitle",
  TableName: "EPISODES_TABLE",
};

export const run = async () => {
  try {
    const data = await ddbClient.send(new QueryCommand(params));
    data.Items.forEach(function (element) {
      console.log(element.Title.S + " (" + element.Subtitle.S + ")");
    });
    return data;
  } catch (err) {
```

```
        console.error(err);
    }
};

run();
```

Create the client for the DynamoDB document client.

```
// Create service client module using ES6 syntax.
import { DynamoDBDocumentClient } from "@aws-sdk/lib-dynamodb";
import { ddbClient } from "./ddbClient";

const marshallOptions = {
    // Whether to automatically convert empty strings, blobs, and sets to `null`.
    convertEmptyValues: false, // false, by default.
    // Whether to remove undefined values while marshalling.
    removeUndefinedValues: false, // false, by default.
    // Whether to convert typeof object to map attribute.
    convertClassInstanceToMap: false, // false, by default.
};

const unmarshallOptions = {
    // Whether to return numbers as a string instead of converting them to native
    // JavaScript numbers.
    wrapNumbers: false, // false, by default.
};

const translateConfig = { marshallOptions, unmarshallOptions };

// Create the DynamoDB Document client.
const ddbDocClient = DynamoDBDocumentClient.from(ddbClient, translateConfig);

export { ddbDocClient };
```

Query the table using the DynamoDB document client.

```
import { QueryCommand } from "@aws-sdk/lib-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";

// Set the parameters.
export const params = {
    ExpressionAttributeNames: { "#r": "rank", "#y": "year" },
    ProjectionExpression: "#r, #y, title",
    TableName: "TABLE_NAME",
    ExpressionAttributeValues: {
        ":t": "MOVIE_NAME",
        ":y": "MOVIE_YEAR",
        ":r": "MOVIE_RANK",
    },
    KeyConditionExpression: "title = :t and #y = :y",
    FilterExpression: "info.#r = :r",
};

export const queryTable = async () => {
    try {
        const data = await ddbDocClient.send(new QueryCommand(params));
        for (let i = 0; i < data.Items.length; i++) {
            console.log(
                "Success. Items with rank of " +
                "MOVIE_RANK" +
                " include\n" +
                "Year = " +
            );
        }
    } catch (err) {
        console.error("Error querying table: ", err);
    }
};
```

```
        data.Items[i].year +
        " Title = " +
        data.Items[i].title
    );
}
} catch (err) {
    console.log("Error", err);
}
};

queryTable();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).

## EventBridge examples using SDK for JavaScript V2

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for JavaScript V2 with Amazon EventBridge.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2847\)](#)

## Actions

### Add a Lambda function target

The following code example shows how to add an AWS Lambda function target to an Amazon EventBridge event.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { EventBridgeClient } from "@aws-sdk/client-eventbridge";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon EventBridge service client object.
export const ebClient = new EventBridgeClient({ region: REGION });
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js.
import { PutTargetsCommand } from "@aws-sdk/client-eventbridge";
import { ebClient } from "./libs/eventBridgeClient.js";

// Set the parameters.
export const params = {
  Rule: "DEMO_EVENT",
  Targets: [
    {
      Arn: "LAMBDA_FUNCTION_ARN", //LAMBDA_FUNCTION_ARN
      Id: "myCloudWatchEventsTarget",
    },
  ],
};

export const run = async () => {
  try {
    const data = await ebClient.send(new PutTargetsCommand(params));
    console.log("Success, target added; requestID: ", data);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
// Uncomment this line to run execution within this file.
// run();
```

### Create an alias for an account

The following code example shows how to create an alias for an IAM account.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
const REGION = "REGION"; // For example, "us-east-1".
// Create an IAM service client object.
const iamClient = new IAMClient({ region: REGION });
export { iamClient };
```

Create the account alias.

```
// Import required AWS SDK clients and commands for Node.js.
import { iamClient } from "./libs/iamClient.js";
import { CreateAccountAliasCommand } from "@aws-sdk/client-iam";

// Set the parameters.
```

```
export const params = { AccountAlias: "ACCOUNT_ALIAS" }; //ACCOUNT_ALIAS

export const run = async () => {
  try {
    const data = await iamClient.send(new CreateAccountAliasCommand(params));
    console.log("Success", data);
    return data;
  } catch (err) {
    console.log("Error", err);
  }
};

run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [CreateAccountAlias](#) in [AWS SDK for JavaScript API Reference](#).

## SDK for JavaScript V3

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";  
// Set the AWS Region.  
const REGION = "REGION"; // For example, "us-east-1".  
// Create an IAM service client object.  
const iamClient = new IAMClient({ region: REGION });  
export { iamClient };
```

List the certificates.

```
// Import required AWS SDK clients and commands for Node.js.  
import { iamClient } from "./libs/iamClient.js";  
import { ListServerCertificatesCommand } from "@aws-sdk/client-iam";
```

```
export const run = async () => {
  try {
    const data = await iamClient.send(new ListServerCertificatesCommand({}));
    console.log("Success", data);
    return data;
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [ListServerCertificates](#) in [AWS SDK for JavaScript API Reference](#).

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create the IAM service object
var iam = new AWS.IAM({apiVersion: '2010-05-08'});

iam.listServerCertificates({}, function(err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data);
  }
});
```

### Send email and text messages

The following code example shows how to send email and text messages with Amazon Pinpoint.

#### SDK for JavaScript V3

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { PinpointClient } from "@aws-sdk/client-pinpoint";
// Set the AWS Region.
const REGION = "us-east-1";
//Set the MediaConvert Service Object
const pinClient = new PinpointClient({region: REGION});
export { pinClient };
```

Send an email message.

```
// Import required AWS SDK clients and commands for Node.js
import { SendMessagesCommand } from "@aws-sdk/client-pinpoint";
import { pinClient } from "./libs/pinClient.js";

// The FromAddress must be verified in SES.
const fromAddress = "FROM_ADDRESS";
const toAddress = "TO_ADDRESS";
const projectId = "PINPOINT_PROJECT_ID";

// The subject line of the email.
var subject = "Amazon Pinpoint Test (AWS SDK for JavaScript in Node.js)";

// The email body for recipients with non-HTML email clients.
var body_text = `Amazon Pinpoint Test (SDK for JavaScript in Node.js)

-----
This email was sent with Amazon Pinpoint using the AWS SDK for JavaScript in Node.js.
For more information, see https://aws.amazon.com/sdk-for-node-js/`;

// The body of the email for recipients whose email clients support HTML content.
var body_html = `<html>
<head></head>
<body>
  <h1>Amazon Pinpoint Test (SDK for JavaScript in Node.js)</h1>
  <p>This email was sent with
    <a href='https://aws.amazon.com/pinpoint/'>the Amazon Pinpoint Email API</a> using
    the
    <a href='https://aws.amazon.com/sdk-for-node-js/'>
      AWS SDK for JavaScript in Node.js
    </a>.</p>

```

```

</body>
</html>';

// The character encoding for the subject line and message body of the email.
var charset = "UTF-8";

const params = {
  ApplicationId: projectId,
  MessageRequest: {
    Addresses: {
      [toAddress]: {
        ChannelType: "EMAIL",
      },
    },
    MessageConfiguration: {
      EmailMessage: {
        FromAddress: fromAddress,
        SimpleEmail: {
          Subject: {
            Charset: charset,
            Data: subject,
          },
          HtmlPart: {
            Charset: charset,
            Data: body_html,
          },
          TextPart: {
            Charset: charset,
            Data: body_text,
          },
        },
      },
    },
  },
};

const run = async () => {
  try {
    const data = await pinClient.send(new SendMessagesCommand(params));

    const {
      MessageResponse: { Result },
    } = data;

    const recipientResult = Result[toAddress];

    if (recipientResult.StatusCode !== 200) {
      throw new Error(recipientResult.StatusMessage);
    } else {
      console.log(recipientResult.MessageId);
    }
  } catch (err) {
    console.log(err.message);
  }
};

run();

```

Send an SMS message.

```

// Import required AWS SDK clients and commands for Node.js
import { SendMessagesCommand } from "@aws-sdk/client-pinpoint";
import { pinClient } from "./libs/pinClient.js";

```

```
("use strict");

/* The phone number or short code to send the message from. The phone number
or short code that you specify has to be associated with your Amazon Pinpoint
account. For best results, specify long codes in E.164 format. */
const originationNumber = "SENDER_NUMBER"; //e.g., +1XXXXXXXXXX

// The recipient's phone number. For best results, you should specify the phone number
// in E.164 format.

## Actions

### Create a multipart upload

The following code example shows how to create a multipart upload to an Amazon S3 Glacier vault.

#### SDK for JavaScript V2

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a multipart upload of 1 megabyte chunks of a Buffer object.

```
// Create a new service object and some supporting variables
var glacier = new AWS.Glacier({apiVersion: '2012-06-01'}),
    vaultName = 'YOUR_VAULT_NAME',
    buffer = new Buffer(2.5 * 1024 * 1024), // 2.5MB buffer
    partSize = 1024 * 1024, // 1MB chunks,
    numPartsLeft = Math.ceil(buffer.length / partSize),
    startTime = new Date(),
    params = {vaultName: vaultName, partSize: partSize.toString()};

// Compute the complete SHA-256 tree hash so we can pass it
// to completeMultipartUpload request at the end
var treeHash = glacier.computeChecksums(buffer).treeHash;

// Initiate the multipart upload
console.log('Initiating upload to', vaultName);
// Call Glacier to initiate the upload.
glacier.initiateMultipartUpload(params, function (mpErr, multipart) {
    if (mpErr) { console.log('Error!', mpErr.stack); return; }
    console.log("Got upload ID", multipart.uploadId);

    // Grab each partSize chunk and upload it as a part
    for (var i = 0; i < buffer.length; i += partSize) {
        var end = Math.min(i + partSize, buffer.length),
            partParams = {
                vaultName: vaultName,
                uploadId: multipart.uploadId,
                range: 'bytes ' + i + '-' + (end-1) + '/',
                body: buffer.slice(i, end)
            };
    }
});
```

```
// Send a single part
console.log('Uploading part', i, '=', partParams.range);
glacier.uploadMultipartPart(partParams, function(multiErr, mData) {
    if (multiErr) return;
    console.log("Completed part", this.request.params.range);
    if (--numPartsLeft > 0) return; // complete only when all parts uploaded

    var doneParams = {
        vaultName: vaultName,
        uploadId: multipart.uploadId,
        archiveSize: buffer.length.toString(),
        checksum: treeHash // the computed tree hash
    };

    console.log("Completing upload...");
    glacier.completeMultipartUpload(doneParams, function(err, data) {
        if (err) {
            console.log("An error occurred while uploading the archive");
            console.log(err);
        } else {
            var delta = (new Date() - startTime) / 1000;
            console.log('Completed upload in', delta, 'seconds');
            console.log('Archive ID:', data.archiveId);
            console.log('Checksum: ', data.checksum);
        }
    });
});
});
```

## Create a vault

The following code example shows how to create an Amazon S3 Glacier vault.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
const { GlacierClient } = require("@aws-sdk/client-glacier");
// Set the AWS Region.
const REGION = "REGION";
//Set the Redshift Service Object
const glacierClient = new GlacierClient({ region: REGION });
export { glacierClient };
```

Create the vault.

```
// Load the SDK for JavaScript
import { CreateVaultCommand } from "@aws-sdk/client-glacier";
import { glacierClient } from "./libs/glacierClient.js";

// Set the parameters
```

```
const vaultname = "VAULT_NAME"; // VAULT_NAME
const params = { vaultName: vaultname };

const run = async () => {
  try {
    const data = await glacierClient.send(new CreateVaultCommand(params));
    console.log("Success, vault created!");
    return data; // For unit tests.
  } catch (err) {
    console.log("Error");
  }
};

run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [CreateVault](#) in [AWS SDK for JavaScript API Reference](#).

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Load the SDK for JavaScript
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create a new service object
var glacier = new AWS.Glacier({apiVersion: '2012-06-01'});
// Call Glacier to create the vault
glacier.createVault({vaultName: 'YOUR_VAULT_NAME'}, function(err) {
  if (!err) {
    console.log("Created vault!")
  }
});
```

### Change how long a queue waits for a message

The following code example shows how to change how long an Amazon SQS queue waits for a message to arrive.

#### SDK for JavaScript V3

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { SQSClient } from "@aws-sdk/client-sqs";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SQS service object.
const sqsClient = new SQSClient({ region: REGION });
export { sqsClient };
```

Change how long an Amazon SQS queue waits for a message to arrive.

```
// Import required AWS SDK clients and commands for Node.js
import { SetQueueAttributesCommand } from "@aws-sdk/client-sqs";
import { sqsClient } from "./libs/sqsClient.js";

// Set the parameters
const params = {
  Attributes: {
    ReceiveMessageWaitTimeSeconds: "20",
  },
  QueueUrl: "SQS_QUEUE_URL", //SQS_QUEUE_URL; e.g., 'https://sqs.REGION.amazonaws.com/
ACCOUNT-ID/QUEUE-NAME'
};

const run = async () => {
  try {
    const data = await sqsClient.send(new SetQueueAttributesCommand(params));
    console.log("Success", data);
    return data; // For unit tests.
  } catch (err) {
    console.error(err, err.stack);
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [SetQueueAttributes](#) in [AWS SDK for JavaScript API Reference](#).

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Change how long an Amazon SQS queue waits for a message to arrive.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create the SQS service object
var sqs = new AWS.SQS({apiVersion: '2012-11-05'});

var params = {
  Attributes: {
    "ReceiveMessageWaitTimeSeconds": "20",
  },
  QueueUrl: "SQS_QUEUE_URL"
};

sqs.setQueueAttributes(params, function(err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data);
  }
});
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).

- For API details, see [SetQueueAttributes](#) in *AWS SDK for JavaScript API Reference*.

## Change message timeout visibility

The following code example shows how to change an Amazon SQS message timeout visibility.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { SQSClient } from "@aws-sdk/client-sqs";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SQS service object.
const sqsClient = new SQSClient({ region: REGION });
export { sqsClient };
```

Receive an Amazon SQS message and change its timeout visibility.

```
// Import required AWS SDK clients and commands for Node.js
import {
  ReceiveMessageCommand,
  ChangeMessageVisibilityCommand,
} from "@aws-sdk/client-sqs";
import { sqsClient } from "./libs/sqsClient.js";

// Set the parameters
const queueURL = "https://sqs.REGION.amazonaws.com/ACCOUNT-ID/QUEUE-NAME"; // REGION,
  ACCOUNT_ID, QUEUE_NAME
const params = {
  AttributeNames: ["SentTimestamp"],
  MaxNumberOfMessages: 1,
  MessageAttributeNames: ["All"],
  QueueUrl: queueURL,
};

const run = async () => {
  try {
    const data = await sqsClient.send(new ReceiveMessageCommand(params));
    if (data.Messages != null) {
      try {
        const visibilityParams = {
          QueueUrl: queueURL,
          ReceiptHandle: data.Messages[0].ReceiptHandle,
          VisibilityTimeout: 20, // 20 second timeout
        };
        const results = await sqsClient.send(
          new ChangeMessageVisibilityCommand(visibilityParams)
        );
        console.log("Timeout Changed", results);
      } catch (err) {
        console.log("Delete Error", err);
      }
    } else {
      console.log("No messages to change");
    }
  }
}
```

```
        return data; // For unit tests.
    } catch (err) {
        console.log("Receive Error", err);
    }
};

run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [ChangeMessageVisibility](#) in [AWS SDK for JavaScript API Reference](#).

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Receive an Amazon SQS message and change its timeout visibility.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk')
// Set the region to us-west-2
AWS.config.update({ region: 'us-west-2' })

// Create the SQS service object
var sqs = new AWS.SQS({ apiVersion: '2012-11-05' })

var queueURL = 'https://sqs.REGION.amazonaws.com/ACCOUNT-ID/QUEUE-NAME'

var params = {
    AttributeNames: ['SentTimestamp'],
    MaxNumberOfMessages: 1,
    MessageAttributeNames: ['All'],
    QueueUrl: queueURL
}

sqs.receiveMessage(params, function (err, data) {
    if (err) {
        console.log('Receive Error', err)
    } else {
        // Make sure we have a message
        if (data.Messages != null) {
            var visibilityParams = {
                QueueUrl: queueURL,
                ReceiptHandle: data.Messages[0].ReceiptHandle,
                VisibilityTimeout: 20 // 20 second timeout
            }
            sqs.changeMessageVisibility(visibilityParams, function (err, data) {
                if (err) {
                    console.log('Delete Error', err)
                } else {
                    console.log('Timeout Changed', data)
                }
            })
        } else {
            console.log('No messages to change')
        }
    }
})
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [ChangeMessageVisibility](#) in [AWS SDK for JavaScript API Reference](#).

## Create a queue

The following code example shows how to create an Amazon SQS queue.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { SQSClient } from "@aws-sdk/client-sqs";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SQS service object.
const sqsClient = new SQSClient({ region: REGION });
export { sqsClient };
```

Create an Amazon SQS standard queue.

```
// Import required AWS SDK clients and commands for Node.js
import { CreateQueueCommand } from "@aws-sdk/client-sqs";
import { sqsClient } from "./libs/sqsClient.js";

// Set the parameters
const params = {
  QueueName: "SQS_QUEUE_NAME", //SQS_QUEUE_URL
  Attributes: {
    DelaySeconds: "60", // Number of seconds delay.
    MessageRetentionPeriod: "86400", // Number of seconds delay.
  },
};

const run = async () => {
  try {
    const data = await sqsClient.send(new CreateQueueCommand(params));
    console.log("Success", data);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

Create an Amazon SQS queue that waits for a message to arrive.

```
// Import required AWS SDK clients and commands for Node.js
import { CreateQueueCommand } from "@aws-sdk/client-sqs";
import { sqsClient } from "./libs/sqsClient.js";

// Set the parameters
const params = {
  QueueName: "SQS_QUEUE_NAME", //SQS_QUEUE_URL; e.g., 'https://
  sqs.REGION.amazonaws.com/ACCOUNT-ID/QUEUE-NAME'
  Attributes: {
    ReceiveMessageWaitTimeSeconds: "20",
  },
};
```

```
const run = async () => {
  try {
    const data = await sqsClient.send(new CreateQueueCommand(params));
    console.log("Success", data);
    return data; // For unit tests.
  } catch (err) {
    console.error(err, err.stack);
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [CreateQueue](#) in *AWS SDK for JavaScript API Reference*.

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create an Amazon SQS standard queue.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create an SQS service object
var sqs = new AWS.SQS({apiVersion: '2012-11-05'});

var params = {
  QueueName: 'SQS_QUEUE_NAME',
  Attributes: {
    'DelaySeconds': '60',
    'MessageRetentionPeriod': '86400'
  }
};

sqs.createQueue(params, function(err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data.QueueUrl);
  }
});
```

Create an Amazon SQS queue that waits for a message to arrive.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create the SQS service object
var sqs = new AWS.SQS({apiVersion: '2012-11-05'});

var params = {
  QueueName: 'SQS_QUEUE_NAME',
  Attributes: {
    'ReceiveMessageWaitTimeSeconds': '20',
  }
}
```

```
};

sq.createQueue(params, function(err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data.QueueUrl);
  }
});
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [CreateQueue](#) in *AWS SDK for JavaScript API Reference*.

## Delete a message from a queue

The following code example shows how to delete a message from an Amazon SQS queue.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { SQSClient } from "@aws-sdk/client-sqs";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SQS service object.
const sqsClient = new SQSClient({ region: REGION });
export { sqsClient };
```

Receive and delete Amazon SQS messages.

```
// Import required AWS SDK clients and commands for Node.js
import {
  ReceiveMessageCommand,
  DeleteMessageCommand,
} from "@aws-sdk/client-sqs";
import { sqsClient } from "./libs/sqsClient.js";

// Set the parameters
const queueURL = "SQS_QUEUE_URL"; //SQS_QUEUE_URL; e.g., 'https://
sqs.REGION.amazonaws.com/ACCOUNT-ID/QUEUE-NAME'
const params = {
  AttributeNames: ["SentTimestamp"],
  MaxNumberOfMessages: 10,
  MessageAttributeNames: ["All"],
  QueueUrl: queueURL,
  VisibilityTimeout: 20,
  WaitTimeSeconds: 0,
};

const run = async () => {
  try {
    const data = await sqsClient.send(new ReceiveMessageCommand(params));
    if (data.Messages) {
      var deleteParams = {
```

```
        QueueUrl: queueURL,
        ReceiptHandle: data.Messages[0].ReceiptHandle,
    };
    try {
        const data = await sqsClient.send(new DeleteMessageCommand(deleteParams));
        console.log("Message deleted", data);
    } catch (err) {
        console.log("Error", err);
    }
} else {
    console.log("No messages to delete");
}
return data; // For unit tests.
} catch (err) {
    console.log("Receive Error", err);
}
};

run();
};
```

Receive and delete Amazon SQS messages.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create an SQS service object
var sqs = new AWS.SQS({apiVersion: '2012-11-05'});

var queueURL = "SQS_QUEUE_URL";

var params = {
    AttributeNames: [
        "SentTimestamp"
    ],
    MaxNumberOfMessages: 10,
    MessageAttributeNames: [
        "All"
    ],
    QueueUrl: queueURL,
    VisibilityTimeout: 20,
    WaitTimeSeconds: 0
};

sqs.receiveMessage(params, function(err, data) {
    if (err) {
        console.log("Receive Error", err);
    } else if (data.Messages) {
        var deleteParams = {
            QueueUrl: queueURL,
            ReceiptHandle: data.Messages[0].ReceiptHandle
        };
        sqs.deleteMessage(deleteParams, function(err, data) {
            if (err) {
                console.log("Delete Error", err);
            }
        });
    }
});
```

```
        } else {
            console.log("Message Deleted", data);
        }
    });
});
});
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [DeleteMessage](#) in [AWS SDK for JavaScript API Reference](#).

## Delete a queue

The following code example shows how to delete an Amazon SQS queue.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { SQSClient } from "@aws-sdk/client-sqs";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SQS service object.
const sqsClient = new SQSClient({ region: REGION });
export { sqsClient };
```

Delete an Amazon SQS queue.

```
// Import required AWS SDK clients and commands for Node.js
import { DeleteQueueCommand } from "@aws-sdk/client-sqs";
import { sqsClient } from "./libs/sqsClient.js";

// Set the parameters
const params = { QueueUrl: "SQS_QUEUE_URL" }; //SQS_QUEUE_URL e.g., 'https://
sqs.REGION.amazonaws.com/ACCOUNT-ID/QUEUE-NAME'

const run = async () => {
    try {
        const data = await sqsClient.send(new DeleteQueueCommand(params));
        console.log("Success", data);
        return data; // For unit tests.
    } catch (err) {
        console.error(err, err.stack);
    }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).

## AWS STS examples using SDK for JavaScript V2

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for JavaScript V2 with AWS Security Token Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2907\)](#)

## Actions

### Assume a role

The following code example shows how to assume a role with AWS STS.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { STSClient } from "@aws-sdk/client-sts";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon STS service client object.
const stsClient = new STSClient({ region: REGION });
export { stsClient };
```

Assume the IAM role.

```
// Import required AWS SDK clients and commands for Node.js
import { stsClient } from "./libs/stsClient.js";
import {
    AssumeRoleCommand,
    GetCallerIdentityCommand,
} from "@aws-sdk/client-sts";

// Set the parameters
export const params = {
    RoleArn: "ARN_OF_ROLE_TO_ASSUME", //ARN_OF_ROLE_TO_ASSUME
    RoleSessionName: "session1",
```

```
    DurationSeconds: 900,
};

export const run = async () => {
  try {
    //Assume Role
    const data = await stsClient.send(new AssumeRoleCommand(params));
    return data;
    const rolecreds = {
      accessKeyId: data.Credentials.AccessKeyId,
      secretAccessKey: data.Credentials.SecretAccessKey,
      sessionToken: data.Credentials.SessionToken,
    };
    //Get Amazon Resource Name (ARN) of current identity
    try {
      const stsParams = { credentials: rolecreds };
      const stsClient = new STSClient(stsParams);
      const results = await stsClient.send(
        new GetCallerIdentityCommand(rolecreds)
      );
      console.log("Success", results);
    } catch (err) {
      console.log(err, err.stack);
    }
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For API details, see [AssumeRole](#) in *AWS SDK for JavaScript API Reference*.

## Actions

### Create an alarm that watches a metric

The following code example shows how to create an Amazon CloudWatch alarm that watches a metric.

#### SDK for JavaScript V3

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { CloudWatchClient } from "@aws-sdk/client-cloudwatch";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon CloudWatch service client object.
export const cwClient = new CloudWatchClient({ region: REGION });
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import { PutMetricAlarmCommand } from "@aws-sdk/client-cloudwatch";
import { cwClient } from "./libs/cloudWatchClient.js";

// Set the parameters
export const params = {
  AlarmName: "Web_Server_CPU_Utilization",
  ComparisonOperator: "GreaterThanOrEqualToThreshold",
  EvaluationPeriods: 1,
  MetricName: "CPUUtilization",
  Namespace: "AWS/EC2",
  Period: 60,
  Statistic: "Average",
  Threshold: 70.0,
  ActionsEnabled: false,
  AlarmDescription: "Alarm when server CPU exceeds 70%",
  Dimensions: [
    {
      Name: "InstanceId",
      Value: "INSTANCE_ID",
    },
  ],
  Unit: "Percent",
};

export const run = async () => {
  try {
    const data = await cwClient.send(new PutMetricAlarmCommand(params));
    console.log("Success", data);
    return data;
  } catch (err) {
    console.log("Error", err);
  }
};
// Uncomment this line to run execution within this file.
// run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [PutMetricAlarm in AWS SDK for JavaScript API Reference](#).

### Delete alarms

The following code example shows how to delete Amazon CloudWatch alarms.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { CloudWatchClient } from "@aws-sdk/client-cloudwatch";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon CloudWatch service client object.
export const cwClient = new CloudWatchClient({ region: REGION });
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import { DeleteAlarmsCommand } from "@aws-sdk/client-cloudwatch";
import { cwClient } from "./libs/cloudWatchClient.js";

// Set the parameters
export const params = { AlarmNames: "ALARM_NAME" }; // e.g.,
  "Web_Server_CPU_Utilization"

export const run = async () => {
  try {
    const data = await cwClient.send(new DeleteAlarmsCommand(params));
    console.log("Success, alarm deleted; requestID:", data);
    return data;
  } catch (err) {
    console.log("Error", err);
  }
};

// Uncomment this line to run execution within this file.
// run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [DeleteAlarms](#) in [AWS SDK for JavaScript API Reference](#).

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Import the SDK and client modules and call the API.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create CloudWatch service object
var cw = new AWS.CloudWatch({apiVersion: '2010-08-01'});

var params = {
  AlarmNames: ['Web_Server_CPU_Utilization']
};

cw.deleteAlarms(params, function(err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data);
  }
});
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [DeleteAlarms](#) in [AWS SDK for JavaScript API Reference](#).

## Describe alarms for a metric

The following code example shows how to describe Amazon CloudWatch alarms for a metric.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { CloudWatchClient } from "@aws-sdk/client-cloudwatch";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon CloudWatch service client object.
export const cwClient = new CloudWatchClient({ region: REGION });
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import { DescribeAlarmsCommand } from "@aws-sdk/client-cloudwatch";
import { cwClient } from "./libs/cloudWatchClient.js";

// Set the parameters
export const params = { StateValue: "INSUFFICIENT_DATA" };

export const run = async () => {
  try {
    const data = await cwClient.send(new DescribeAlarmsCommand(params));
    console.log("Success", data);
    data.MetricAlarms.forEach(function (item) {
      console.log(item.AlarmName);
    });
    return data;
  } catch (err) {
    console.log("Error", err);
  }
};
// Uncomment this line to run execution within this file.
// run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [DescribeAlarmsForMetric](#) in [AWS SDK for JavaScript API Reference](#).

### SDK for JavaScript V2

#### Note

### Put data into a metric

The following code example shows how to put data into a Amazon CloudWatch metric.

#### SDK for JavaScript V3

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { CloudWatchClient } from "@aws-sdk/client-cloudwatch";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon CloudWatch service client object.
export const cwClient = new CloudWatchClient({ region: REGION });
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import { PutMetricDataCommand } from "@aws-sdk/client-cloudwatch";
import { cwClient } from "./libs/cloudWatchClient.js";

// Set the parameters
export const params = {
    MetricData: [
        {
            MetricName: "PAGES_VISITED",
            Dimensions: [
                {
                    Name: "UNIQUE_PAGES",
                    Value: "URLS",
                },
            ],
            Unit: "None",
            Value: 1.0,
        },
    ],
},
```

```
    Namespace: "SITE/TRAFFIC",
};

export const run = async () => {
  try {
    const data = await cwClient.send(new PutMetricDataCommand(params));
    console.log("Success", data.$metadata.requestId);
    return data;
  } catch (err) {
    console.log("Error", err);
  }
};
// Uncomment this line to run execution within this file.
// run();
```

## CloudWatch Events examples using SDK for JavaScript V3

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for JavaScript V3 with Amazon CloudWatch Events.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2922\)](#)

## Actions

### Adding a Lambda function target

The following code example shows how to add an AWS Lambda function target to an Amazon CloudWatch Events event.

#### SDK for JavaScript V3

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { CloudWatchEventsClient } from "@aws-sdk/client-cloudwatch-events";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon CloudWatch service client object.
export const cweClient = new CloudWatchEventsClient({ region: REGION });
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import { PutTargetsCommand } from "@aws-sdk/client-cloudwatch-events";
import { cweClient } from "./libs/cloudWatchEventsClient.js";

// Set the parameters
export const params = {
  Rule: "DEMO_EVENT",
  Targets: [
    {
      Arn: "LAMBDA_FUNCTION_ARN", //LAMBDA_FUNCTION_ARN
      Id: "myCloudWatchEventsTarget",
    },
  ],
};

export const run = async () => {
  try {
    const data = await cweClient.send(new PutTargetsCommand(params));
    console.log("Success, target added; requestID: ", data);
    return data; // For unit tests.
  } catch (err) {
```

```
        console.log("Error", err);
    }
};

// Uncomment this line to run execution within this file.

import { CloudWatchLogsClient } from "@aws-sdk/client-cloudwatch-logs";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon CloudWatch Logs service client object.
export const cwlClient = new CloudWatchLogsClient({ region: REGION });
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import {
  PutSubscriptionFilterCommand,
} from "@aws-sdk/client-cloudwatch-logs";
import { cwlClient } from "./libs/cloudWatchLogsClient.js";

// Set the parameters
export const params = {
  destinationArn: "LAMBDA_FUNCTION_ARN", //LAMBDA_FUNCTION_ARN
  filterName: "FILTER_NAME", //FILTER_NAME
  filterPattern: "ERROR",
  logGroupName: "LOG_GROUP", //LOG_GROUP
};

export const run = async () => {
  try {
    const data = await cwlClient.send(new PutSubscriptionFilterCommand(params));
    console.log("Success", data.subscriptionFilters);
    return data; //For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
// Uncomment this line to run execution within this file.
// run();
```

- For API details, see [PutSubscriptionFilter](#) in [AWS SDK for JavaScript API Reference](#).

## Delete a subscription filter

The following code example shows how to delete an Amazon CloudWatch Logs subscription filter.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { CloudWatchLogsClient } from "@aws-sdk/client-cloudwatch-logs";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon CloudWatch Logs service client object.
export const cwlClient = new CloudWatchLogsClient({ region: REGION });
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import {
  DeleteSubscriptionFilterCommand
} from "@aws-sdk/client-cloudwatch-logs";
import { cwlClient } from "./libs/cloudWatchLogsClient.js";

// Set the parameters
export const params = {
  filterName: "FILTER", //FILTER
  logGroupName: "LOG_GROUP", //LOG_GROUP
};

export const run = async () => {
  try {
    const data = await cwlClient.send(
      new DeleteSubscriptionFilterCommand(params)
    );
    console.log(
      "Success, subscription filter deleted",
    );
  } catch (err) {
    console.error(`Error: ${err}`);
  }
};
```

```
        data
    );
    return data; //For unit tests.
} catch (err) {
    console.log("Error", err);
}
};

// Uncomment this line to run execution within this file.
// run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [DeleteSubscriptionFilter](#) in *AWS SDK for JavaScript API Reference*.

## SDK for JavaScript V2

## Amazon Cognito Identity Provider examples using SDK for JavaScript V3

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for JavaScript V3 with Amazon Cognito Identity Provider.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2931\)](#)
- [Scenarios \(p. 2937\)](#)

## Actions

### Confirm a user

The following code example shows how to confirm an Amazon Cognito user.

#### SDK for JavaScript V3

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
const confirmSignUp = async ({ clientId, username, code }) => {
  const client = createClientForDefaultRegion(CognitoIdentityProviderClient);

  const command = new ConfirmSignUpCommand({
    ClientId: clientId,
    Username: username,
    ConfirmationCode: code,
  });

  return client.send(command);
};
```

- For API details, see [ConfirmSignUp](#) in [AWS SDK for JavaScript API Reference](#).

### Confirm an MFA device for tracking

The following code example shows how to confirm an MFA device for tracking by Amazon Cognito.

#### SDK for JavaScript V3

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
const confirmDevice = async ({ deviceKey, accessToken, passwordVerifier, salt }) => {
  const client = createClientForDefaultRegion(CognitoIdentityProviderClient);

  const command = new ConfirmDeviceCommand({
    DeviceKey: deviceKey,
    AccessToken: accessToken,
    DeviceSecretVerifierConfig: {
      PasswordVerifier: passwordVerifier,
      Salt: salt
    },
  });

  return client.send(command);
};
```

- For API details, see [ConfirmDevice](#) in *AWS SDK for JavaScript API Reference*.

## Get a token to associate an MFA application with a user

The following code example shows how to get a token to associate an MFA application with an Amazon Cognito user.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
const associateSoftwareToken = async (session) => {
  const client = createClientForDefaultRegion(CognitoIdentityProviderClient);
  const command = new AssociateSoftwareTokenCommand({
    Session: session,
  });

  return client.send(command);
};
```

- For API details, see [AssociateSoftwareToken](#) in *AWS SDK for JavaScript API Reference*.

## Get information about a user

The following code example shows how to get information about an Amazon Cognito user.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
const admin GetUser = async ({ userPoolId, username }) => {
  const client = createClientForDefaultRegion(CognitoIdentityProviderClient);

  const command = new AdminGetUserCommand({
    UserPoolId: userPoolId,
    Username: username,
  });
};
```

```
    return client.send(command);
};
```

- For API details, see [Admin GetUser](#) in *AWS SDK for JavaScript API Reference*.

## List users

The following code example shows how to list Amazon Cognito users.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
const listUsers = async ({ userPoolId }) => {
  const client = createClientForDefaultRegion(CognitoIdentityProviderClient);

  const command = new ListUsersCommand({
    UserPoolId: userPoolId,
  });

  return client.send(command);
};
```

- For API details, see [ListUsers](#) in *AWS SDK for JavaScript API Reference*.

## Resend a confirmation code

The following code example shows how to resend an Amazon Cognito confirmation code.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
const resendConfirmationCode = async ({ clientId, username }) => {
  const client = createClientForDefaultRegion(CognitoIdentityProviderClient);

  const command = new ResendConfirmationCodeCommand({
    ClientId: clientId,
    Username: username
  });

  return client.send(command);
};
```

- For API details, see [ResendConfirmationCode](#) in *AWS SDK for JavaScript API Reference*.

## Respond to SRP authentication challenges

The following code example shows how to respond to Amazon Cognito SRP authentication challenges.

}) => {
  const client = createClientForDefaultRegion(CognitoIdentityProviderClient);

  const command = new RespondToAuthChallengeCommand({
    ChallengeName: ChallengeNameType.SOFTWARE_TOKEN_MFA,
    ChallengeResponses: {
      SOFTWARE_TOKEN_MFA_CODE: code,
      USERNAME: username,
    },
    ClientId: clientId,
    UserPoolId: userPoolId,
    Session: session,
  });

  return client.send(command);
};
```

- For API details, see [RespondToAuthChallenge](#) in *AWS SDK for JavaScript API Reference*.

## Respond to an authentication challenge

The following code example shows how to respond to an Amazon Cognito authentication challenge.

## SDK for JavaScript V3

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
const adminRespondToAuthChallenge = async ({
  userPoolId,
  clientId,
  username,
  totp,
  session,
}) => {
  const client = createClientForDefaultRegion(CognitoIdentityProviderClient);
  const command = new AdminRespondToAuthChallengeCommand({
    ChallengeName: ChallengeNameType.SOFTWARE_TOKEN_MFA,
    ChallengeResponses: {
      SOFTWARE_TOKEN_MFA_CODE: totp,
      USERNAME: username,
    },
    ClientId: clientId,
    UserPoolId: userPoolId,
    Session: session,
  });
};
```

```
    return client.send(command);
};
```

- For API details, see [AdminRespondToAuthChallenge](#) in *AWS SDK for JavaScript API Reference*.

## Sign up a user

The following code example shows how to sign up a user with Amazon Cognito.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
const signUp = async ({ clientId, username, password, email }) => {
  const client = createClientForDefaultRegion(CognitoIdentityProviderClient);

  const command = new SignUpCommand({
    ClientId: clientId,
    Username: username,
    Password: password,
    UserAttributes: [{ Name: "email", Value: email }],
  });

  return client.send(command);
};
```

- For API details, see [SignUp](#) in *AWS SDK for JavaScript API Reference*.

## Start authentication with a tracked device

The following code example shows how to start authentication with a device tracked by Amazon Cognito.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
const initiateAuth = async ({ username, password, clientId }) => {
  const client = createClientForDefaultRegion(CognitoIdentityProviderClient);

  const command = new InitiateAuthCommand({
    AuthFlow: AuthFlowType.USER_PASSWORD_AUTH,
    AuthParameters: {
      USERNAME: username,
      PASSWORD: password,
    },
    ClientId: clientId,
  });

  return client.send(command);
};
```

- For API details, see [InitiateAuth](#) in *AWS SDK for JavaScript API Reference*.

### Start authentication with administrator credentials

The following code example shows how to start authentication with Amazon Cognito and administrator credentials.

#### SDK for JavaScript V3

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
const adminInitiateAuth = async ({  
    clientId,  
    userPoolId,  
    username,  
    password,  
) => {  
    const client = createClientForDefaultRegion(CognitoIdentityProviderClient);  
  
    const command = new AdminInitiateAuthCommand({  
        ClientId: clientId,  
        UserPoolId: userPoolId,  
        AuthFlow: AuthFlowType.ADMIN_USER_PASSWORD_AUTH,  
        AuthParameters: { USERNAME: username, PASSWORD: password },  
    });  
  
    return client.send(command);  
};
```

- For API details, see [AdminInitiateAuth](#) in *AWS SDK for JavaScript API Reference*.

### Verify an MFA application with a user

The following code example shows how to verify an MFA application with an Amazon Cognito user.

#### SDK for JavaScript V3

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
const verifySoftwareToken = async (totp) => {  
    const client = createClientForDefaultRegion(CognitoIdentityProviderClient);  
    // The 'Session' is provided in the response to 'AssociateSoftwareToken'.  
    const session = process.env.SESSION;  
  
    if (!session) {  
        throw new Error(  
            "Missing a valid Session. Did you run 'admin-initiate-auth'?"  
        );  
    }  
  
    const command = new VerifySoftwareTokenCommand({  
        Session: session,  
        UserCode: totp,  
    });
```

```
    return client.send(command);
};
```

- For API details, see [VerifySoftwareToken](#) in *AWS SDK for JavaScript API Reference*.

## Scenarios

### Sign up a user with a user pool that requires MFA

The following code example shows how to:

- Sign up a user with a user name, password, and email address.
- Confirm the user from a code sent in email.
- Set up multi-factor authentication by associating an MFA application with the user.
- Sign in by using a password and an MFA code.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

For the best experience, clone the GitHub repository and run this example. The following code represents a sample of the full example application.

```
import { log } from "../../libs/utils/util-log.js";
import { signUp } from "../../actions/sign-up.js";
import { FILE_USER_POOLS } from "./constants.js";
import { getSecondValuesFromEntries } from "../../libs/utils/util-csv.js";

## DynamoDB examples using SDK for JavaScript V3

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for JavaScript V3 with Amazon DynamoDB.

**Actions** are code excerpts that show you how to call individual service functions.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2943\)](#)
- [Scenarios \(p. 2977\)](#)

## Actions

### Create a table

The following code example shows how to create a DynamoDB table.

#### SDK for JavaScript V3

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.  
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";  
// Set the AWS Region.  
const REGION = "REGION"; //e.g. "us-east-1"  
// Create an Amazon DynamoDB service client object.  
const ddbClient = new DynamoDBClient({ region: REGION });  
export { ddbClient };
```

Create the table.

```
// Import required AWS SDK clients and commands for Node.js  
import { CreateTableCommand } from "@aws-sdk/client-dynamodb";  
import { ddbClient } from "./libs/ddbClient.js";  
  
// Set the parameters  
export const params = {  
    AttributeDefinitions: [  
        {  
            AttributeName: "Season", //ATTRIBUTE_NAME_1  
            AttributeType: "N", //ATTRIBUTE_TYPE  
        },  
        {  
            AttributeName: "Episode", //ATTRIBUTE_NAME_2  
            AttributeType: "N", //ATTRIBUTE_TYPE  
        },  
    ],  
    KeySchema: [  
        {  
            AttributeName: "Season", //ATTRIBUTE_NAME_1  
            KeyType: "HASH",
```

```
        },
        {
            AttributeName: "Episode", //ATTRIBUTE_NAME_2
            KeyType: "RANGE",
        },
    ],
    ProvisionedThroughput: {
        ReadCapacityUnits: 1,
        WriteCapacityUnits: 1,
    },
    TableName: "TEST_TABLE", //TABLE_NAME
    StreamSpecification: {
        StreamEnabled: false,
    },
};

export const run = async () => {
    try {
        const data = await ddbClient.send(new CreateTableCommand(params));
        console.log("Table Created", data);
        return data;
    } catch (err) {
        console.log("Error", err);
    }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create the DynamoDB service object
var ddb = new AWS.DynamoDB({apiVersion: '2012-08-10'});

var params = {
    AttributeDefinitions: [
        {
            AttributeName: 'CUSTOMER_ID',
            AttributeType: 'N'
        },
        {
            AttributeName: 'CUSTOMER_NAME',
            AttributeType: 'S'
        }
    ],
    KeySchema: [
        {
            AttributeName: 'CUSTOMER_ID',
            KeyType: 'HASH'
        },
        {
            AttributeName: 'CUSTOMER_NAME',
            KeyType: 'RANGE'
        }
    ]
};
```

```
        },
    ],
    ProvisionedThroughput: {
        ReadCapacityUnits: 1,
        WriteCapacityUnits: 1
    },
    TableName: 'CUSTOMER_LIST',
    StreamSpecification: {
        StreamEnabled: false
    }
};

// Call DynamoDB to create the table
ddb.createTable(params, function(err, data) {
    if (err) {
        console.log("Error", err);
    } else {
        console.log("Table Created", data);
    }
});
```

## Delete a table

The following code example shows how to delete a DynamoDB table.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create the DynamoDB service client module using ES6 syntax.
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";
import { DEFAULT_REGION } from "../../libs/utils/util-aws-sdk.js";
// Create an Amazon DynamoDB service client object.
export const ddbClient = new DynamoDBClient({ region: DEFAULT_REGION });
```

Delete the table.

```
// Import required AWS SDK clients and commands for Node.js
import { DeleteTableCommand } from "@aws-sdk/client-dynamodb";
import { ddbClient } from "./libs/ddbClient.js";

// Set the parameters
export const params = {
    TableName: "CUSTOMER_LIST_NEW",
};

export const run = async () => {
    try {
        const data = await ddbClient.send(new DeleteTableCommand(params));
        console.log("Success, table deleted", data);
        return data;
    } catch (err) {
        console.log("Error", err);
    }
};
```

```
    }
};

run();
```

- For API details, see [DeleteTable](#) in *AWS SDK for JavaScript API Reference*.

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create the DynamoDB service object
var ddb = new AWS.DynamoDB({apiVersion: '2012-08-10'});

var params = {
  TableName: process.argv[2]
};

// Call DynamoDB to delete the specified table
ddb.deleteTable(params, function(err, data) {
  if (err && err.code === 'ResourceNotFoundException') {
    console.log("Error: Table not found");
  } else if (err && err.code === 'ResourceInUseException') {
    console.log("Error: Table in use");
  } else {
    console.log("Success", data);
  }
});
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [DeleteTable](#) in *AWS SDK for JavaScript API Reference*.

## Delete an item from a table

The following code example shows how to delete an item from a DynamoDB table.

## SDK for JavaScript V3

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create the DynamoDB service client module using ES6 syntax.
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";
import { DEFAULT_REGION } from "../../../../libs/utils/util-aws-sdk.js";
// Create an Amazon DynamoDB service client object.
export const ddbClient = new DynamoDBClient({ region: DEFAULT_REGION });
```

Create the document client.

```
// Create a service client module using ES6 syntax.  
import { DynamoDBDocumentClient } from "@aws-sdk/lib-dynamodb";  
import { ddbClient } from "./ddbClient.js";  
  
const marshallOptions = {  
    // Whether to automatically convert empty strings, blobs, and sets to `null`.  
    convertEmptyValues: false, // false, by default.  
    // Whether to remove undefined values while marshalling.  
    removeUndefinedValues: true, // false, by default.  
    // Whether to convert typeof object to map attribute.  
    convertClassInstanceToMap: false, // false, by default.  
};  
  
const unmarshallOptions = {  
    // Whether to return numbers as a string instead of converting them to native  
    // JavaScript numbers.  
    wrapNumbers: false, // false, by default.  
};  
  
// Create the DynamoDB document client.  
const ddbDocClient = DynamoDBDocumentClient.from(ddbClient, {  
    marshallOptions,  
    unmarshallOptions,  
});  
  
export { ddbDocClient };
```

Delete an item from a table using the DynamoDB document client.

```
import { DeleteCommand } from "@aws-sdk/lib-dynamodb";  
import { ddbDocClient } from "../libs/ddbDocClient.js";  
  
// Set the parameters.  
export const params = {  
    TableName: "TABLE_NAME",  
    Key: {  
        primaryKey: "VALUE_1",  
        sortKey: "VALUE_2",  
    },  
};  
  
export const deleteItem = async () => {  
    try {  
        await ddbDocClient.send(new DeleteCommand(params));  
        console.log("Success - item deleted");  
    } catch (err) {  
        console.log("Error", err);  
    }  
};  
deleteItem();
```

Delete an item from a table using PartiQL.

```
// Import required AWS SDK clients and commands for Node.js.  
import { ExecuteStatementCommand } from "@aws-sdk/client-dynamodb";  
import { ddbDocClient } from "../libs/ddbDocClient.js";  
  
const tableName = process.argv[2];
```

```
const movieYear1 = process.argv[3];
const movieTitle1 = process.argv[4];

export const run = async (tableName, movieYear1, movieTitle1) => {
    const params = {
        Statement: "DELETE FROM " + tableName + " where title=? and year=?",
        Parameters: [{ S: movieTitle1 }, { N: movieYear1 }],
    };
    try {
        await ddbDocClient.send(new ExecuteStatementCommand(params));
        console.log("Success. Item deleted.");
        return "Run successfully"; // For unit tests.
    } catch (err) {
        console.error(err);
    }
};
run(tableName, movieYear1, movieTitle1);
```

Delete an item from a table by batch using PartiQL.

```
// Import required AWS SDK clients and commands for Node.js.
import { BatchExecuteStatementCommand } from "@aws-sdk/client-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";

const tableName = process.argv[2];
const movieYear1 = process.argv[3];
const movieTitle1 = process.argv[4];
const movieYear2 = process.argv[5];
const movieTitle2 = process.argv[6];

export const run = async (
    tableName,
    movieYear1,
    movieTitle1,
    movieYear2,
    movieTitle2
) => {
    try {
        const params = {
            Statements: [
                {
                    Statement: "DELETE FROM " + tableName + " where year=? and title=?",
                    Parameters: [{ N: movieYear1 }, { S: movieTitle1 }],
                },
                {
                    Statement: "DELETE FROM " + tableName + " where year=? and title=?",
                    Parameters: [{ N: movieYear2 }, { S: movieTitle2 }],
                },
            ],
        };
        const data = await ddbDocClient.send(
            new BatchExecuteStatementCommand(params)
        );
        console.log("Success. Items deleted.", data);
        return "Run successfully"; // For unit tests.
    } catch (err) {
        console.error(err);
    }
};
run(tableName, movieYear1, movieTitle1, movieYear2, movieTitle2);
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).

- For API details, see [DeleteItem](#) in *AWS SDK for JavaScript API Reference*.

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Delete an item from a table.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create the DynamoDB service object
var ddb = new AWS.DynamoDB({apiVersion: '2012-08-10'});

var params = {
  TableName: 'TABLE',
  Key: {
    'KEY_NAME': {N: 'VALUE'}
  }
};

// Call DynamoDB to delete the item from the table
ddb.deleteItem(params, function(err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data);
  }
});
```

Delete an item from a table using the DynamoDB document client.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create DynamoDB document client
var docClient = new AWS.DynamoDB.DocumentClient({apiVersion: '2012-08-10'});

var params = {
  Key: {
    'HASH_KEY': VALUE
  },
  TableName: 'TABLE'
};

docClient.delete(params, function(err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data);
  }
});
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [DeleteItem](#) in *AWS SDK for JavaScript API Reference*.

## Get a batch of items

The following code example shows how to get a batch of DynamoDB items.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.  
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";  
// Set the AWS Region.  
const REGION = "REGION"; //e.g. "us-east-1"  
// Create an Amazon DynamoDB service client object.  
const ddbClient = new DynamoDBClient({ region: REGION });  
export { ddbClient };
```

Get the items.

```
// Import required AWS SDK clients and commands for Node.js  
import { BatchGetItemCommand } from "@aws-sdk/client-dynamodb";  
import { ddbClient } from "./libs/ddbClient.js";  
  
// Set the parameters  
export const params = {  
    RequestItems: {  
        TABLE_NAME: {  
            Keys: [  
                {  
                    KEY_NAME_1: { N: "KEY_VALUE" },  
                    KEY_NAME_2: { N: "KEY_VALUE" },  
                    KEY_NAME_3: { N: "KEY_VALUE" },  
                },  
            ],  
            ProjectionExpression: "ATTRIBUTE_NAME",  
        },  
    },  
};  
  
export const run = async () => {  
    try {  
        const data = await ddbClient.send(new BatchGetItemCommand(params));  
        console.log("Success, items retrieved", data);  
        return data;  
    } catch (err) {  
        console.log("Error", err);  
    }  
};  
run();
```

## Get an item from a table

The following code example shows how to get an item from a DynamoDB table.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create the DynamoDB service client module using ES6 syntax.
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";
import { DEFAULT_REGION } from "../../../../../libs/utils/util-aws-sdk.js";
// Create an Amazon DynamoDB service client object.
export const ddbClient = new DynamoDBClient({ region: DEFAULT_REGION });
```

Create the DynamoDB document client.

```
// Create a service client module using ES6 syntax.
import { DynamoDBDocumentClient } from "@aws-sdk/lib-dynamodb";
import { ddbClient } from "./ddbClient.js";
```

```
const marshallOptions = {
    // Whether to automatically convert empty strings, blobs, and sets to `null`.
    convertEmptyValues: false, // false, by default.
    // Whether to remove undefined values while marshalling.
    removeUndefinedValues: true, // false, by default.
    // Whether to convert typeof object to map attribute.
    convertClassInstanceToMap: false, // false, by default.
};

const unmarshallOptions = {
    // Whether to return numbers as a string instead of converting them to native
    // JavaScript numbers.
    wrapNumbers: false, // false, by default.
};

// Create the DynamoDB document client.
const ddbDocClient = DynamoDBDocumentClient.from(ddbClient, {
    marshallOptions,
    unmarshallOptions,
});

export { ddbDocClient };
```

Get an item from a table.

```
import { GetCommand } from "@aws-sdk/lib-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";

// Set the parameters.
export const params = {
    TableName: "TABLE_NAME",
    Key: {
        primaryKey: "VALUE_1",
        sortKey: "VALUE_2",
    },
};

export const getItem = async () => {
    try {
        const data = await ddbDocClient.send(new GetCommand(params));
        console.log("Success :", data.Item);
    } catch (err) {
        console.log("Error", err);
    }
};
getItem();
```

Get an item from a table using PartiQL.

```
// Import required AWS SDK clients and commands for Node.js.
import { ExecuteStatementCommand } from "@aws-sdk/client-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient";

const tableName = process.argv[2];
const movieTitle1 = process.argv[3];

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Get an item from a table.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create the DynamoDB service object
var ddb = new AWS.DynamoDB({apiVersion: '2012-08-10'});

var params = {
  TableName: 'TABLE',
  Key: {
    'KEY_NAME': {N: '001'}
  },
  ProjectionExpression: 'ATTRIBUTE_NAME'
};

// Call DynamoDB to read the item from the table
ddb.getItem(params, function(err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data.Item);
  }
});
```

Get an item from a table using the DynamoDB document client.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create DynamoDB document client
var docClient = new AWS.DynamoDB.DocumentClient({apiVersion: '2012-08-10'});

var params = {
  TableName: 'EPISODES_TABLE',
  Key: {'KEY_NAME': VALUE}
};

docClient.get(params, function(err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data.Item);
  }
});
```

## Get information about a table

The following code example shows how to get information about a DynamoDB table.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.  
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";  
// Set the AWS Region.  
const REGION = "REGION"; //e.g. "us-east-1"  
// Create an Amazon DynamoDB service client object.  
const ddbClient = new DynamoDBClient({ region: REGION });  
export { ddbClient };
```

Describe the table.

```
// Import required AWS SDK clients and commands for Node.js  
import { DescribeTableCommand } from "@aws-sdk/client-dynamodb";  
import { ddbClient } from "./libs/ddbClient.js";  
  
// Set the parameters  
export const params = { TableName: "TABLE_NAME" }; //TABLE_NAME  
  
export const run = async () => {  
    try {  
        const data = await ddbClient.send(new DescribeTableCommand(params));  
        console.log("Success", data);  
        // console.log("Success", data.Table.KeySchema);  
        return data;  
    } catch (err) {  
        console.log("Error", err);  
    }  
};  
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [DescribeTable](#) in *AWS SDK for JavaScript API Reference*.

### SDK for JavaScript V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Load the AWS SDK for Node.js  
var AWS = require('aws-sdk');  
// Set the region  
AWS.config.update({region: 'REGION'});  
  
// Create the DynamoDB service object  
var ddb = new AWS.DynamoDB({apiVersion: '2012-08-10'});
```

```
var params = {
  TableName: process.argv[2]
};

// Call DynamoDB to retrieve the selected table descriptions
ddb.describeTable(params, function(err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data.Table.KeySchema);
  }
});
```

## List tables

The following code example shows how to list DynamoDB tables.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon DynamoDB service client object.
const ddbClient = new DynamoDBClient({ region: REGION });
export { ddbClient };
```

List the tables.

```
// Import required AWS SDK clients and commands for Node.js
import { ListTablesCommand } from "@aws-sdk/client-dynamodb";
import { ddbClient } from "./libs/ddbClient.js";

export const run = async () => {
  try {
    const data = await ddbClient.send(new ListTablesCommand({}));
    console.log(data);
    // console.log(data.TableNames.join("\n"));
    return data;
  } catch (err) {
    console.error(err);
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [ListTables](#) in [AWS SDK for JavaScript API Reference](#).

## Put an item in a table

The following code example shows how to put an item in a DynamoDB table.

## SDK for JavaScript V3

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create the DynamoDB service client module using ES6 syntax.
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";
import { DEFAULT_REGION } from "../../../../../libs/utils/util-aws-sdk.js";
// Create an Amazon DynamoDB service client object.
export const ddbClient = new DynamoDBClient({ region: DEFAULT_REGION });
```

Create the DynamoDB document client.

```
// Create a service client module using ES6 syntax.
import { DynamoDBDocumentClient } from "@aws-sdk/lib-dynamodb";
import { ddbClient } from "./ddbClient.js";

const marshallOptions = {
  // Whether to automatically convert empty strings, blobs, and sets to `null`.
  convertEmptyValues: false, // false, by default.
  // Whether to remove undefined values while marshalling.
  removeUndefinedValues: true, // false, by default.
  // Whether to convert typeof object to map attribute.
  convertClassInstanceToMap: false, // false, by default.
};
```

```
const unmarshallOptions = {
    // Whether to return numbers as a string instead of converting them to native
    // JavaScript numbers.
    wrapNumbers: false, // false, by default.
};

// Create the DynamoDB document client.
const ddbDocClient = DynamoDBDocumentClient.from(ddbClient, {
    marshallOptions,
    unmarshallOptions,
});

export { ddbDocClient };
```

Put an item in a table using the DynamoDB document client.

```
import { PutCommand } from "@aws-sdk/lib-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";

export const putItem = async () => {
    // Set the parameters.
    export const params = {
        TableName: "TABLE_NAME",
        Item: {
            primaryKey: "VALUE_1",
            sortKey: "VALUE_2",
        },
    };
    try {
        const data = await ddbDocClient.send(new PutCommand(params));
        console.log("Success - item added or updated", data);
    } catch (err) {
        console.log("Error", err.stack);
    }
};
putItem();
```

Put an item in a table using PartiQL.

```
// Import required AWS SDK clients and commands for Node.js.
import { ExecuteStatementCommand } from "@aws-sdk/client-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";

const tableName = process.argv[2];
const movieYear1 = process.argv[3];
const movieTitle1 = process.argv[4];

export const run = async (tableName, movieTitle1, movieYear1) => {
    const params = {
        Statement: "INSERT INTO " + tableName + " value {'title':?:, 'year':?}",
        Parameters: [{ S: movieTitle1 }, { N: movieYear1 }],
    };
    try {
        await ddbDocClient.send(new ExecuteStatementCommand(params));
        console.log("Success. Item added.");
        return "Run successfully"; // For unit tests.
    } catch (err) {
        console.error(err);
    }
};
```

```
run(tableName, movieTitle1, movieYear1);
```

Put items by batch in a table using PartiQL.

```
// Import required AWS SDK clients and commands for Node.js.
import { BatchExecuteStatementCommand } from "@aws-sdk/client-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";

const tableName = process.argv[2];
const movieYear1 = process.argv[3];
const movieTitle1 = process.argv[4];
const movieYear2 = process.argv[5];
const movieTitle2 = process.argv[6];

export const run = async (
  tableName,
  movieYear1,
  movieTitle1,
  movieYear2,
  movieTitle2
) => {
  const params = {
    Statements: [
      {
        Statement:
          "INSERT INTO " + tableName + " value {'title':?, 'year':?}",
        Parameters: [{ S: movieTitle1 }, { N: movieYear1 }],
      },
      {
        Statement:
          "INSERT INTO " + tableName + " value {'title':?, 'year':?}",
        Parameters: [{ S: movieTitle2 }, { N: movieYear2 }],
      },
    ],
  };
  try {
    await ddbDocClient.send(
      new BatchExecuteStatementCommand(params)
    );
    console.log("Success. Items added.");
    return "Run successfully"; // For unit tests.
  } catch (err) {
    console.error(err);
  }
};
run(tableName, movieYear1, movieTitle1, movieYear2, movieTitle2);
```

- For API details, see [PutItem](#) in *AWS SDK for JavaScript API Reference*.

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Put an item in a table.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});
```

```
// Create the DynamoDB service object
var ddb = new AWS.DynamoDB({apiVersion: '2012-08-10'});

var params = {
  TableName: 'CUSTOMER_LIST',
  Item: {
    'CUSTOMER_ID' : {N: '001'},
    'CUSTOMER_NAME' : {S: 'Richard Roe'}
  }
};

// Call DynamoDB to add the item to the table
ddb.putItem(params, function(err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data);
  }
});
```

Put an item in a table using the DynamoDB document client.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create DynamoDB document client
var docClient = new AWS.DynamoDB.DocumentClient({apiVersion: '2012-08-10'});

var params = {
  TableName: 'TABLE',
  Item: {
    'HASHKEY': VALUE,
    'ATTRIBUTE_1': 'STRING_VALUE',
    'ATTRIBUTE_2': VALUE_2
  }
};

docClient.put(params, function(err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data);
  }
});
```

## Query a table

The following code example shows how to query a DynamoDB table.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.  
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";  
// Set the AWS Region.  
const REGION = "REGION"; //e.g. "us-east-1"  
// Create an Amazon DynamoDB service client object.  
const ddbClient = new DynamoDBClient({ region: REGION });  
export { ddbClient };
```

Query the table.

```
// Import required AWS SDK clients and commands for Node.js  
import { QueryCommand } from "@aws-sdk/client-dynamodb";  
import { ddbClient } from "./libs/ddbClient.js";  
  
// Set the parameters  
export const params = {  
    KeyConditionExpression: "Season = :s and Episode > :e",  
    FilterExpression: "contains (Subtitle, :topic)",  
    ExpressionAttributeValues: {  
        ":s": { N: "1" },  
        ":e": { N: "2" },  
        ":topic": { S: "SubTitle" },  
    },  
    ProjectionExpression: "Episode, Title, Subtitle",  
    TableName: "EPISODES_TABLE",  
};  
  
export const run = async () => {  
    try {  
        const data = await ddbClient.send(new QueryCommand(params));  
        data.Items.forEach(function (element) {  
            console.log(element.Title.S + " (" + element.Subtitle.S + ")");  
        });  
        return data;  
    } catch (err) {  
        console.error(err);  
    }  
};  
run();
```

Create the client for the DynamoDB document client.

```
// Create service client module using ES6 syntax.  
import { DynamoDBDocumentClient } from "@aws-sdk/lib-dynamodb";  
import { ddbClient } from "./ddbClient";  
  
const marshallOptions = {  
    // Whether to automatically convert empty strings, blobs, and sets to `null`.  
    convertEmptyValues: false, // false, by default.  
    // Whether to remove undefined values while marshalling.  
    removeUndefinedValues: false, // false, by default.  
    // Whether to convert typeof object to map attribute.  
    convertClassInstanceToMap: false, // false, by default.  
};  
  
const unmarshallOptions = {  
    // Whether to return numbers as a string instead of converting them to native  
    // JavaScript numbers.  
};
```

```
        wrapNumbers: false, // false, by default.  
};  
  
const translateConfig = { marshallOptions, unmarshallOptions };  
  
// Create the DynamoDB Document client.  
const ddbDocClient = DynamoDBDocumentClient.from(ddbClient, translateConfig);  
  
export { ddbDocClient };
```

Query the table using the DynamoDB document client.

```
import { QueryCommand } from "@aws-sdk/lib-dynamodb";  
import { ddbDocClient } from "../libs/ddbDocClient.js";  
  
// Set the parameters.  
export const params = {  
    ExpressionAttributeNames: { "#r": "rank", "#y": "year" },  
    ProjectionExpression: "#r, #y, title",  
    TableName: "TABLE_NAME",  
    ExpressionAttributeValues: {  
        ":t": "MOVIE_NAME",  
        ":y": "MOVIE_YEAR",  
        ":r": "MOVIE_RANK",  
    },  
    KeyConditionExpression: "title = :t and #y = :y",  
    FilterExpression: "info.#r = :r",  
};  
  
export const queryTable = async () => {  
    try {  
        const data = await ddbDocClient.send(new QueryCommand(params));  
        for (let i = 0; i < data.Items.length; i++) {  
            console.log(  
                "Success. Items with rank of " +  
                "MOVIE_RANK" +  
                " include\n" +  
                "Year = " +  
                data.Items[i].year +  
                " Title = " +  
                data.Items[i].title  
            );  
        }  
    } catch (err) {  
        console.log("Error", err);  
    }  
};  
queryTable();
```

## Run a PartiQL statement

The following code example shows how to run a PartiQL statement on a DynamoDB table.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create the DynamoDB service client module using ES6 syntax.
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";
// Set the AWS Region.
export const REGION = "eu-west-1"; // For example, "us-east-1".
// Create an Amazon DynamoDB service client object.
export const ddbClient = new DynamoDBClient({ region: REGION });
```

Create the DynamoDB document client.

```
// Create a service client module using ES6 syntax.
import { DynamoDBDocumentClient } from "@aws-sdk/lib-dynamodb";
import { ddbClient } from "./ddbClient.js";

const marshallOptions = {
    // Whether to automatically convert empty strings, blobs, and sets to `null`.
    convertEmptyValues: false, // false, by default.
    // Whether to remove undefined values while marshalling.
    removeUndefinedValues: false, // false, by default.
    // Whether to convert typeof object to map attribute.
    convertClassInstanceToMap: false, // false, by default.
```

```
};

const unmarshallOptions = {
    // Whether to return numbers as a string instead of converting them to native
    // JavaScript numbers.
    wrapNumbers: false, // false, by default.
};

const translateConfig = { marshallOptions, unmarshallOptions };

// Create the DynamoDB document client.
const ddbDocClient = DynamoDBDocumentClient.from(ddbClient, translateConfig);

export { ddbDocClient };
```

Create an item using PartiQL.

```
// Import required AWS SDK clients and commands for Node.js.
import { ExecuteStatementCommand } from "@aws-sdk/client-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";

const tableName = process.argv[2];
const movieYear1 = process.argv[3];
const movieTitle1 = process.argv[4];

export const run = async (tableName, movieTitle1, movieYear1) => {
    const params = {
        Statement: "INSERT INTO " + tableName + " value {'title':?:, 'year':?}",
        Parameters: [{ S: movieTitle1 }, { N: movieYear1 }],
    };
    try {
        await ddbDocClient.send(new ExecuteStatementCommand(params));
        console.log("Success. Item added.");
        return "Run successfully"; // For unit tests.
    } catch (err) {
        console.error(err);
    }
};
run(tableName, movieTitle1, movieYear1);
```

Get an item using PartiQL.

```
// Import required AWS SDK clients and commands for Node.js.
import { ExecuteStatementCommand } from "@aws-sdk/client-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient";

const tableName = process.argv[2];
const movieTitle1 = process.argv[3];

export const run = async (tableName, movieTitle1) => {
    const params = {
        Statement: "SELECT * FROM " + tableName + " where title=?",
        Parameters: [{ S: movieTitle1 }],
    };
    try {
        const data = await ddbDocClient.send(new ExecuteStatementCommand(params));
        for (let i = 0; i < data.Items.length; i++) {
            console.log(
                "Success. The query return the following data. Item " + i,
            );
        }
    } catch (err) {
        console.error(err);
    }
};
```

```
        data.Items[i].year,
        data.Items[i].title,
        data.Items[i].info
    );
}
return "Run successfully"; // For unit tests.
} catch (err) {
    console.error(err);
}
};

run(tableName, movieTitle1);
```

Update an item using PartiQL.

```
// Import required AWS SDK clients and commands for Node.js.
import { ExecuteStatementCommand } from "@aws-sdk/client-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";

const tableName = process.argv[2];
const movieYear1 = process.argv[3];
const movieTitle1 = process.argv[4];
const producer1 = process.argv[5];

export const run = async (tableName, movieYear1, movieTitle1, producer1) => {
    const params = {
        Statement:
            "UPDATE " + tableName + " SET Producer=? where title=? and year=?",
        Parameters: [{ S: producer1 }, { S: movieTitle1 }, { N: movieYear1 }],
    };
    try {
        await ddbDocClient.send(new ExecuteStatementCommand(params));
        console.log("Success. Item updated.");
        return "Run successfully"; // For unit tests.
    } catch (err) {
        console.error(err);
    }
};
run(tableName, movieYear1, movieTitle1, producer1);
```

Delete an item using PartiQL.

```
// Import required AWS SDK clients and commands for Node.js.
import { ExecuteStatementCommand } from "@aws-sdk/client-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";

const tableName = process.argv[2];
const movieYear1 = process.argv[3];
const movieTitle1 = process.argv[4];

export const run = async (tableName, movieYear1, movieTitle1) => {
    const params = {
        Statement: "DELETE FROM " + tableName + " where title=? and year=?",
        Parameters: [{ S: movieTitle1 }, { N: movieYear1 }],
    };
    try {
        await ddbDocClient.send(new ExecuteStatementCommand(params));
        console.log("Success. Item deleted.");
        return "Run successfully"; // For unit tests.
    } catch (err) {
```

```
        console.error(err);
    }
};

run(tableName, movieYear1, movieTitle1);
```

- For API details, see [ExecuteStatement](#) in *AWS SDK for JavaScript API Reference*.

## Run batches of PartiQL statements

The following code example shows how to run batches of PartiQL statements on a DynamoDB table.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create the DynamoDB service client module using ES6 syntax.
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";
// Set the AWS Region.
export const REGION = "eu-west-1"; // For example, "us-east-1".
// Create an Amazon DynamoDB service client object.
export const ddbClient = new DynamoDBClient({ region: REGION });
```

Create the DynamoDB document client.

```
// Create a service client module using ES6 syntax.
import { DynamoDBDocumentClient } from "@aws-sdk/lib-dynamodb";
import { ddbClient } from "./ddbClient.js";

const marshallOptions = {
    // Whether to automatically convert empty strings, blobs, and sets to `null`.
    convertEmptyValues: false, // false, by default.
    // Whether to remove undefined values while marshalling.
    removeUndefinedValues: false, // false, by default.
    // Whether to convert typeof object to map attribute.
    convertClassInstanceToMap: false, // false, by default.
};

const unmarshallOptions = {

## Scan a table

The following code example shows how to scan a DynamoDB table.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create the DynamoDB service client module using ES6 syntax.
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";
import { DEFAULT_REGION } from "../../../../../libs/utils/util-aws-sdk.js";
// Create an Amazon DynamoDB service client object.
export const ddbClient = new DynamoDBClient({ region: DEFAULT_REGION });
```

Create the DynamoDB document client.

```
// Create a service client module using ES6 syntax.
import { DynamoDBDocumentClient } from "@aws-sdk/lib-dynamodb";
import { ddbClient } from "./ddbClient.js";

const marshallOptions = {
    // Whether to automatically convert empty strings, blobs, and sets to `null`.
    convertEmptyValues: false, // false, by default.
    // Whether to remove undefined values while marshalling.
    removeUndefinedValues: true, // false, by default.
    // Whether to convert typeof object to map attribute.
    convertClassInstanceToMap: false, // false, by default.
};

const unmarshallOptions = {
    // Whether to return numbers as a string instead of converting them to native
    // JavaScript numbers.
    wrapNumbers: false, // false, by default.
};

// Create the DynamoDB document client.
const ddbDocClient = DynamoDBDocumentClient.from(ddbClient, {
    marshallOptions,
    unmarshallOptions,
});

export { ddbDocClient };
```

Scan a table using the DynamoDB document client.

```
// Import required AWS SDK clients and commands for Node.js.
import { ddbDocClient } from "../../libs/ddbDocClient.js";
import { ScanCommand } from "@aws-sdk/lib-dynamodb";
// Set the parameters.
export const params = {
    TableName: "TABLE_NAME",
```

```
ProjectionExpression: "#r, #y, title",
ExpressionAttributeNames: { "#r": "rank", "#y": "year" },
FilterExpression: "title = :t and #y = :y and info.#r = :r",
ExpressionAttributeValues: {
    ":r": "MOVIE_RANK",
    ":y": "MOVIE_YEAR",
    ":t": "MOVIE_NAME",
},
};

export const scanTable = async () => {
    try {
        const data = await ddbDocClient.send(new ScanCommand(params));
        console.log("success", data.Items);
    } catch (err) {
        console.log("Error", err);
    }
};
scanTable();
```

## Update an item in a table

The following code example shows how to update an item in a DynamoDB table.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create the DynamoDB service client module using ES6 syntax.
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";
import { DEFAULT_REGION } from "../../../../../libs/utils/util-aws-sdk.js";
// Create an Amazon DynamoDB service client object.
export const ddbClient = new DynamoDBClient({ region: DEFAULT_REGION });
```

Create the DynamoDB document client.

```
// Create a service client module using ES6 syntax.
import { DynamoDBDocumentClient } from "@aws-sdk/lib-dynamodb";
import { ddbClient } from "./ddbClient.js";

const marshallOptions = {
    // Whether to automatically convert empty strings, blobs, and sets to `null`.
    convertEmptyValues: false, // false, by default.
    // Whether to remove undefined values while marshalling.
    removeUndefinedValues: true, // false, by default.
    // Whether to convert typeof object to map attribute.
    convertClassInstanceToMap: false, // false, by default.
};

const unmarshallOptions = {
    // Whether to return numbers as a string instead of converting them to native
    // JavaScript numbers.
    wrapNumbers: false, // false, by default.
};

// Create the DynamoDB document client.
const ddbDocClient = DynamoDBDocumentClient.from(ddbClient, {
    marshallOptions,
    unmarshallOptions,
});

export { ddbDocClient };
```

Update an item in a table using the DynamoDB document client.

```
import { UpdateCommand } from "@aws-sdk/lib-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";
```

```
export const updateItem = async () => {
  // Set the parameters.
  const params = {
    TableName: "TABLE_NAME",
    Key: {
      title: "MOVIE_NAME",
      year: "MOVIE_YEAR",
    },
    ProjectionExpression: "#r",
    ExpressionAttributeNames: { "#r": "rank" },
    UpdateExpression: "set info.plot = :p, info.#r = :r",
    ExpressionAttributeValues: {
      ":p": "MOVIE_PLOT",
      ":r": "MOVIE_RANK",
    },
  };
  try {
    const data = await ddbDocClient.send(new UpdateCommand(params));
    console.log("Success - item added or updated", data);
    return data;
  } catch (err) {
    console.log("Error", err);
  }
};
updateItem();
```

Update an item in a table using PartiQL.

```
// Import required AWS SDK clients and commands for Node.js.
import { ExecuteStatementCommand } from "@aws-sdk/client-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";

const tableName = process.argv[2];
const movieYear1 = process.argv[3];

export const run = async (tableName, movieYear1, movieTitle1, producer1) => {
  const params = {
    Statement:
      "UPDATE " + tableName + " SET Producer=? where title=? and year=?",
    Parameters: [{ S: producer1 }, { S: movieTitle1 }, { N: movieYear1 }],
  };
  try {
    await ddbDocClient.send(new ExecuteStatementCommand(params));
    console.log("Success. Item updated.");
    return "Run successfully"; // For unit tests.
  } catch (err) {
    console.error(err);
  }
};
run(tableName, movieYear1, movieTitle1, producer1);
```

Update items by batch in a table using PartiQL.

```
// Import required AWS SDK clients and commands for Node.js.
import { BatchExecuteStatementCommand } from "@aws-sdk/client-dynamodb";
import { ddbDocClient } from "../libs/ddbDocClient.js";
```

```
const tableName = process.argv[2];
const movieYear1 = process.argv[3];
const movieTitle1 = process.argv[4];
const movieYear2 = process.argv[6];
const movieTitle2 = process.argv[7];
const producer1 = process.argv[5];
const producer2 = process.argv[8];

export const run = async (
  tableName,
  movieYear1,
  movieTitle1,
  movieYear2,
  movieTitle2,
  producer1,
  producer2
) => {
  const params = {
    Statements: [
      {
        Statement:
          "UPDATE " + tableName + " SET producer=? where title=? and year=?",
        Parameters: [{ S: producer1 }, { S: movieTitle1 }, { N: movieYear1 }],
      },
      {
        Statement:
          "UPDATE " + tableName + " SET producer=? where title=? and year=?",
        Parameters: [{ S: producer2 }, { S: movieTitle2 }, { N: movieYear2 }],
      },
    ],
  };
  try {
    await ddbDocClient.send(
      new BatchExecuteStatementCommand(params)
    );
    console.log("Success. Items updated.");
    return "Run successfully"; // For unit tests.
  } catch (err) {
    console.error(err);
  }
};
run(
  tableName,
  movieYear1,
  movieTitle1,
  movieYear2,
  movieTitle2,
  producer1,
  producer2
);
```

- For API details, see [UpdateItem](#) in *AWS SDK for JavaScript API Reference*.

## Write a batch of items

The following code example shows how to write a batch of DynamoDB items.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create the DynamoDB service client module using ES6 syntax.  
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";  
import { DEFAULT_REGION } from "../../../../../libs/utils/util-aws-sdk.js";  
// Create an Amazon DynamoDB service client object.  
export const ddbClient = new DynamoDBClient({ region: DEFAULT_REGION });
```

Create the document client.

```
// Create a service client module using ES6 syntax.  
import { DynamoDBDocumentClient } from "@aws-sdk/lib-dynamodb";  
import { ddbClient } from "./ddbClient.js";  
  
const marshallOptions = {  
    // Whether to automatically convert empty strings, blobs, and sets to `null`.  
    convertEmptyValues: false, // false, by default.  
    // Whether to remove undefined values while marshalling.  
    removeUndefinedValues: true, // false, by default.  
    // Whether to convert typeof object to map attribute.  
    convertClassInstanceToMap: false, // false, by default.  
};  
  
const unmarshallOptions = {  
    // Whether to return numbers as a string instead of converting them to native  
    // JavaScript numbers.  
    wrapNumbers: false, // false, by default.  
};  
  
// Create the DynamoDB document client.  
const ddbDocClient = DynamoDBDocumentClient.from(ddbClient, {  
    marshallOptions,  
    unmarshallOptions,  
});  
  
export { ddbDocClient };
```

Add the items to the table.

```
import fs from "fs";  
import * as R from "ramda";  
import { ddbDocClient } from "../libs/ddbDocClient.js";  
import { BatchWriteCommand } from "@aws-sdk/lib-dynamodb";  
  
export const writeData = async () => {  
    // Before you run this example, download 'movies.json' from https://  
    // docs.aws.amazon.com/amazondynamodb/latest/developerguide/GettingStarted.Js.02.html,  
    // and put it in the same folder as the example.  
    // Get the movie data parse to convert into a JSON object.  
    const allMovies = JSON.parse(fs.readFileSync("moviedata.json", "utf8"));  
    // Split the table into segments of 25.  
    const dataSegments = R.splitEvery(25, allMovies);  
    const TABLE_NAME = "TABLE_NAME"  
    try {  
        // Loop batch write operation 10 times to upload 250 items.  
        for (let i = 0; i < 10; i++) {  
            const segment = dataSegments[i];  
            for (let j = 0; j < 25; j++) {  
                const params = {
```

```
RequestItems: {
    [TABLE_NAME]: [
        {
            // Destination Amazon DynamoDB table name.
            PutRequest: {
                Item: {
                    year: segment[j].year,
                    title: segment[j].title,
                    info: segment[j].info,
                },
            },
        ],
    ],
},
ddbDocClient.send(new BatchWriteCommand(params));
}
console.log("Success, table updated.");
}
} catch (error) {
    console.log("Error", error);
}
};
writeData();
}
```

- For API details, see [BatchWriteItem](#) in *AWS SDK for JavaScript API Reference*.

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create DynamoDB service object
var ddb = new AWS.DynamoDB({apiVersion: '2012-08-10'});

var params = {
    RequestItems: {
        "TABLE_NAME": [
            {
                PutRequest: {
                    Item: {
                        "KEY": { "N": "KEY_VALUE" },
                        "ATTRIBUTE_1": { "S": "ATTRIBUTE_1_VALUE" },
                        "ATTRIBUTE_2": { "N": "ATTRIBUTE_2_VALUE" }
                    }
                }
            },
            {
                PutRequest: {
                    Item: {
                        "KEY": { "N": "KEY_VALUE" },
                        "ATTRIBUTE_1": { "S": "ATTRIBUTE_1_VALUE" },
                        "ATTRIBUTE_2": { "N": "ATTRIBUTE_2_VALUE" }
                    }
                }
            }
        ]
    }
}
```

```
        }
    });

ddb.batchWriteItem(params, function(err, data) {
    if (err) {
        console.log("Error", err);
    } else {
        console.log("Success", data);
    }
});
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [BatchWriteItem in AWS SDK for JavaScript API Reference](#).

## Scenarios

### Get started using tables, items, and queries

The following code example shows how to:

- Create a table that can hold movie data.
- Put, get, and update a single movie in the table.
- Write movie data to the table from a sample JSON file.
- Query for movies that were released in a given year.
- Scan for movies that were released in a range of years.
- Delete a movie from the table.
- Delete the table.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create a DynamoDB client.

```
// Create the DynamoDB service client module using ES6 syntax.
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";
import { DEFAULT_REGION } from "../../../../../libs/utils/util-aws-sdk.js";
// Create an Amazon DynamoDB service client object.
export const ddbClient = new DynamoDBClient({ region: DEFAULT_REGION });
```

Create a DynamoDB document client.

```
// Create a service client module using ES6 syntax.
import { DynamoDBDocumentClient } from "@aws-sdk/lib-dynamodb";
import { ddbClient } from "./ddbClient.js";

const marshallOptions = {
    // Whether to automatically convert empty strings, blobs, and sets to `null`.
    convertEmptyValues: false, // false, by default.
    // Whether to remove undefined values while marshalling.
    removeUndefinedValues: true, // false, by default.
    // Whether to convert typeof object to map attribute.
```

```
    convertClassInstanceToMap: false, // false, by default.
};

const unmarshallOptions = {
  // Whether to return numbers as a string instead of converting them to native
  // JavaScript numbers.
  wrapNumbers: false, // false, by default.
};

// Create the DynamoDB document client.
const ddbDocClient = DynamoDBDocumentClient.from(ddbClient, {
  marshallOptions,
  unmarshallOptions,
});

export { ddbDocClient };
```

Run the scenario.

```
import fs from "fs";
import { splitEvery } from "ramda";
import {
  PutCommand,
  GetCommand,
  UpdateCommand,
  BatchWriteCommand,
  DeleteCommand,
  ScanCommand,
  QueryCommand,
} from "@aws-sdk/lib-dynamodb";

## Query a table by using batches of PartiQL statements

The following code example shows how to:

- Get a batch of items by running multiple SELECT statements.
- Add a batch of items by running multiple INSERT statements.
- Update a batch of items by running multiple UPDATE statements.
- Delete a batch of items by running multiple DELETE statements.

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create the DynamoDB service client module using ES6 syntax.
import { DynamoDBClient } from "@aws-sdk/client-dynamodb";
// Set the AWS Region.
export const REGION = "eu-west-1"; // For example, "us-east-1".
// Create an Amazon DynamoDB service client object.
export const ddbClient = new DynamoDBClient({ region: REGION });
```

Create the document client.

```
// Create a service client module using ES6 syntax.
import { DynamoDBDocumentClient } from "@aws-sdk/lib-dynamodb";
import { ddbClient } from "./ddbClient.js";

const marshallOptions = {
    // Whether to automatically convert empty strings, blobs, and sets to `null`.
    convertEmptyValues: false, // false, by default.
    // Whether to remove undefined values while marshalling.
    removeUndefinedValues: false, // false, by default.
    // Whether to convert typeof object to map attribute.
    convertClassInstanceToMap: false, // false, by default.
};

const unmarshallOptions = {
    // Whether to return numbers as a string instead of converting them to native
    // JavaScript numbers.
    wrapNumbers: false, // false, by default.
};

const translateConfig = { marshallOptions, unmarshallOptions };

// Create the DynamoDB document client.
const ddbDocClient = DynamoDBDocumentClient.from(ddbClient, translateConfig);

export { ddbDocClient };
```

Query items by batch.

```
/*

## EventBridge examples using SDK for JavaScript V3

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for JavaScript V3 with Amazon EventBridge.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 2993\)](#)

## Actions

### Add a Lambda function target

The following code example shows how to add an AWS Lambda function target to an Amazon EventBridge event.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { EventBridgeClient } from "@aws-sdk/client-eventbridge";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon EventBridge service client object.
export const ebClient = new EventBridgeClient({ region: REGION });
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js.
import { PutTargetsCommand } from "@aws-sdk/client-eventbridge";
import { ebClient } from "./libs/eventBridgeClient.js";

// Set the parameters.
export const params = {
  Rule: "DEMO_EVENT",
  Targets: [
    {
      Arn: "LAMBDA_FUNCTION_ARN", //LAMBDA_FUNCTION_ARN
      Id: "myCloudWatchEventsTarget",
    },
  ],
};
```

```
export const run = async () => {
  try {
    const data = await ebClient.send(new PutTargetsCommand(params));
    console.log("Success, target added; requestID: ", data);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
// Uncomment this line to run execution within this file.
// run();
```

- For API details, see [PutTargets](#) in *AWS SDK for JavaScript API Reference*.

### SDK for JavaScript V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create CloudWatchEvents service object
var ebevents = new AWS.EventBridge({apiVersion: '2015-10-07'});

var params = {
  Rule: 'DEMO_EVENT',
  Targets: [
    {
      Arn: 'LAMBDA_FUNCTION_ARN',
      Id: 'myEventBridgeTarget',
    }
  ]
};

ebevents.putTargets(params, function(err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data);
  }
});
```

- For API details, see [PutTargets](#) in *AWS SDK for JavaScript API Reference*.

### Create a scheduled rule

The following code example shows how to create an Amazon EventBridge scheduled rule.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { EventBridgeClient } from "@aws-sdk/client-eventbridge";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon EventBridge service client object.
export const ebClient = new EventBridgeClient({ region: REGION });
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js.
import { PutRuleCommand } from "@aws-sdk/client-eventbridge";
import { ebClient } from "./libs/eventBridgeClient.js";

// Set the parameters.
export const params = {
  Name: "DEMO_EVENT",
  RoleArn: "IAM_ROLE_ARN", //IAM_ROLE_ARN
  ScheduleExpression: "rate(5 minutes)",
  State: "ENABLED",
};

export const run = async () => {
  try {
    const data = await ebClient.send(new PutRuleCommand(params));
    console.log("Success, scheduled rule created; Rule ARN:", data);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
// Uncomment this line to run execution within this file.
// run();
```

- For API details, see [PutRule](#) in *AWS SDK for JavaScript API Reference*.

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create CloudWatchEvents service object
var ebevents = new AWS.EventBridge({apiVersion: '2015-10-07'});

var params = {
  Name: 'DEMO_EVENT',
  RoleArn: 'IAM_ROLE_ARN',
  ScheduleExpression: 'rate(5 minutes)',
  State: 'ENABLED'
};

ebevents.putRule(params, function(err, data) {
  if (err) {
    console.log("Error", err);
```

```
    } else {
      console.log("Success", data.RuleArn);
    }
});
```

- For API details, see [PutRule](#) in *AWS SDK for JavaScript API Reference*.

## Send events

The following code example shows how to send Amazon EventBridge events.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { EventBridgeClient } from "@aws-sdk/client-eventbridge";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create an Amazon EventBridge service client object.
export const ebClient = new EventBridgeClient({ region: REGION });
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js.
import { PutEventsCommand } from "@aws-sdk/client-eventbridge";
import { ebClient } from "./libs/eventBridgeClient.js";

// Set the parameters.
export const params = {
  Entries: [
    {
      Detail: '{ "key1": "value1", "key2": "value2" }',
      DetailType: "appRequestSubmitted",
      Resources: [
        "RESOURCE_ARN", //RESOURCE_ARN
      ],
      Source: "com.company.app",
    },
  ],
};

export const run = async () => {
  try {
    const data = await ebClient.send(new PutEventsCommand(params));
    console.log("Success, event sent; requestID:", data);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
// Uncomment this line to run execution within this file.
// run();
```

- For API details, see [PutEvents](#) in *AWS SDK for JavaScript API Reference*.

  const command = new StartJobRunCommand({
    JobName: jobName,
    Arguments: {
      '--input_database': dbName,
      '--input_table': tableName,
      '--output_bucket_url': `s3://${bucketName}/`
    }
  });

  return client.send(command);
};
```

- For API details, see [StartJobRun](#) in *AWS SDK for JavaScript API Reference*.

## Scenarios

### Get started running crawlers and jobs

The following code example shows how to:

- Create and run a crawler that crawls a public Amazon Simple Storage Service (Amazon S3) bucket and generates a metadata database that describes the CSV-formatted data it finds.
- List information about databases and tables in your AWS Glue Data Catalog.
- Create and run a job that extracts CSV data from the source Amazon S3 bucket, transforms it by removing and renaming fields, and loads JSON-formatted output into another Amazon S3 bucket.
- List information about job runs and view some of the transformed data.
- Delete all resources created by the demo.

For more information, see [Tutorial: Getting started with AWS Glue Studio](#).

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create and run a crawler that crawls a public Amazon Simple Storage Service (Amazon S3) bucket and generates a metadata database that describes the CSV-formatted data it finds.

```
const createCrawler = (name, role, dbName, tablePrefix, s3TargetPath) => {
  const client = new GlueClient({ region: DEFAULT_REGION });

  const command = new CreateCrawlerCommand({
    Name: name,
    Role: role,
```

```
    DatabaseName: dbName,
    TablePrefix: tablePrefix,
    Targets: {
      S3Targets: [{ Path: s3TargetPath }],
    },
  });

  return client.send(command);
};

const getCrawler = (name) => {
  const client = new GlueClient({ region: DEFAULT_REGION });

  const command = new GetCrawlerCommand({
    Name: name,
  });

  return client.send(command);
};

const startCrawler = (name) => {
  const client = new GlueClient({ region: DEFAULT_REGION });

  const command = new StartCrawlerCommand({
    Name: name,
  });

  return client.send(command);
};

const crawlerExists = async ({ getCrawler }, crawlerName) => {
  try {
    await getCrawler(crawlerName);
    return true;
  } catch {
    return false;
  }
};

const makeCreateCrawlerStep = (actions) => async (context) => {
  if (await crawlerExists(actions, process.env.CRAWLER_NAME)) {
    log("Crawler already exists. Skipping creation.");
  } else {
    await actions.createCrawler(
      process.env.CRAWLER_NAME,
      process.env.ROLE_NAME,
      process.env.DATABASE_NAME,
      process.env.TABLE_PREFIX,
      process.env.S3_TARGET_PATH
    );

    log("Crawler created successfully.", { type: "success" });
  }

  return { ...context };
};

const waitForCrawler = async (getCrawler, crawlerName) => {
  const waitTimeInSeconds = 30;
  const { Crawler } = await getCrawler(crawlerName);

  if (!Crawler) {
    throw new Error(`Crawler with name ${crawlerName} not found.`);
  }

  if (Crawler.State === "READY") {
```

```
        return;
    }

    log(`Crawler is ${Crawler.State}. Waiting ${waitTimeInSeconds} seconds...`);
    await wait(waitTimeInSeconds);
    return waitForCrawler(getCrawler, crawlerName);
};

const makeStartCrawlerStep =
  ({ startCrawler, getCrawler }) =>
  async (context) => {
    log("Starting crawler.");
    await startCrawler(process.env.CRAWLER_NAME);
    log("Crawler started.", { type: "success" });

    log("Waiting for crawler to finish running. This can take a while.");
    await waitForCrawler(getCrawler, process.env.CRAWLER_NAME);
    log("Crawler ready.", { type: "success" });

    return { ...context };
};
```

List information about databases and tables in your AWS Glue Data Catalog.

```
const getDatabase = (name) => {
  const client = new GlueClient({ region: DEFAULT_REGION });

  const command = new GetDatabaseCommand({
    Name: name,
  });

  return client.send(command);
};

## IAM examples using SDK for JavaScript V3

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for JavaScript V3 with AWS Identity and Access Management.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3012\)](#)
- [Scenarios \(p. 3048\)](#)

## Actions

### Attach a policy to a role

The following code example shows how to attach an IAM policy to a role.

#### SDK for JavaScript V3

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
const REGION = "REGION"; // For example, "us-east-1".
// Create an IAM service client object.
const iamClient = new IAMClient({ region: REGION });
export { iamClient };
```

Attach the policy.

```
// Import required AWS SDK clients and commands for Node.js.
```

```
import { iamClient } from "./libs/iamClient.js";
import {
  ListAttachedRolePoliciesCommand,
  AttachRolePolicyCommand,
} from "@aws-sdk/client-iam";

// Set the parameters.
const ROLENAMESPACE = "ROLE_NAME";
const paramsRoleList = { RoleName: ROLENAMESPACE }; //ROLE_NAME
export const params = {
  PolicyArn: "arn:aws:iam::aws:policy/AmazonDynamoDBFullAccess",
  RoleName: ROLENAMESPACE,
};
export const run = async () => {
  try {
    const data = await iamClient.send(
      new ListAttachedRolePoliciesCommand(paramsRoleList)
    );
    const myRolePolicies = data.AttachedPolicies;
    myRolePolicies.forEach(function (_val, index) {
      if (myRolePolicies[index].PolicyName === "AmazonDynamoDBFullAccess") {
        console.log(
          "AmazonDynamoDBFullAccess is already attached to this role."
        );
        process.exit();
      }
    });
    try {
      const data = await iamClient.send(new AttachRolePolicyCommand(params));
      console.log("Role attached successfully");
      return data;
    } catch (err) {
      console.log("Error", err);
    }
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

## Create a policy

The following code example shows how to create an IAM policy.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
const REGION = "REGION"; // For example, "us-east-1".
// Create an IAM service client object.
const iamClient = new IAMClient({ region: REGION });
export { iamClient };
```

Create the policy.

```
// Import required AWS SDK clients and commands for Node.js.
import { iamClient } from "./libs/iamClient.js";
import { CreatePolicyCommand } from "@aws-sdk/client-iam";

// Set the parameters.
const myManagedPolicy = {
    Version: "2012-10-17",
    Statement: [
        {
            Effect: "Allow",
            Action: "logs:CreateLogGroup",
            Resource: "RESOURCE_ARN", // RESOURCE_ARN
```

```
        },
        {
          Effect: "Allow",
          Action: [
            "dynamodb>DeleteItem",
            "dynamodb>GetItem",
            "dynamodb>PutItem",
            "dynamodb>Scan",
            "dynamodb>UpdateItem",
          ],
          Resource: "DYNAMODB_POLICY_NAME", // DYNAMODB_POLICY_NAME; For example,
          "myDynamoDBName".
        },
      ],
    };
  export const params = {
    PolicyDocument: JSON.stringify(myManagedPolicy),
    PolicyName: "IAM_POLICY_NAME",
  };

  export const run = async () => {
    try {
      const data = await iamClient.send(new CreatePolicyCommand(params));
      console.log("Success", data);
      return data;
    } catch (err) {
      console.log("Error", err);
    }
  };
run();
```

## Create a role

The following code example shows how to create an IAM role.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
const REGION = "REGION"; // For example, "us-east-1".
// Create an IAM service client object.
const iamClient = new IAMClient({ region: REGION });
export { iamClient };
```

Create the role.

```
// Import required AWS SDK clients and commands for Node.js.
import { iamClient } from "./libs/iamClient.js";
import { CreateRoleCommand } from "@aws-sdk/client-iam";

// Sample assume role policy JSON.
const role_json = {
    Version: "2012-10-17",
    Statement: [
        {
            Effect: "Allow",
            Principal: {
                AWS: "USER_ARN", // The ARN of the user.
            },
            Action: "sts:AssumeRole",
        },
    ],
};
```

```
        ],
};

// Stringify the assume role policy JSON.
const myJson = JSON.stringify(role_json);

// Set the parameters.
const params = {
    AssumeRolePolicyDocument: myJson,
    Path: "/",
    RoleName: "ROLE_NAME"
};

const run = async () => {
    try {
        const data = await iamClient.send(new CreateRoleCommand(params));
        console.log("Success. Role created. Role Arn: ", data.Role.RoleName);
    } catch (err) {
        console.log("Error", err);
    }
};
run();
```

- For API details, see [CreateRole](#) in *AWS SDK for JavaScript API Reference*.

## Create a service-linked role

The following code example shows how to create an IAM service-linked role.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
const REGION = "REGION"; // For example, "us-east-1".
// Create an IAM service client object.
const iamClient = new IAMClient({ region: REGION });
export { iamClient };
```

Create a service-linked role.

```
// Import required AWS SDK clients and commands for Node.js.
import { iamClient } from "./libs/iamClient.js";
import { CreateServiceLinkedRoleCommand } from "@aws-sdk/client-iam";
// Set the parameters.
const params = {
    AWSServiceName: "AWS_SERVICE_NAME" /* required */,
};

const run = async () => {
    try {
        const data = await iamClient.send(
            new CreateServiceLinkedRoleCommand(params)
        );
        console.log("Success", data);
    } catch (err) {
```

```
        console.log("Error", err);
    }
};

run();
```

- For API details, see [CreateServiceLinkedRole](#) in *AWS SDK for JavaScript API Reference*.

## Create a user

The following code example shows how to create an IAM user.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
const REGION = "REGION"; // For example, "us-east-1".
// Create an IAM service client object.
const iamClient = new IAMClient({ region: REGION });
export { iamClient };
```

Create the user.

```
// Import required AWS SDK clients and commands for Node.js.
import { iamClient } from "./libs/iamClient.js";
import { GetUserCommand, CreateUserCommand } from "@aws-sdk/client-iam";

// Set the parameters.
export const params = { UserName: "USER_NAME" }; //USER_NAME

export const run = async () => {
    try {
        const data = await iamClient.send(new GetUserCommand(params));
        console.log(
            "User " + "USER_NAME" + " already exists",
            data.UserId
        );
        return data;
    } catch (err) {
        try {
            const results = await iamClient.send(new CreateUserCommand(params));
            console.log("Success", results);
            return results;
        } catch (err) {
            console.log("Error", err);
        }
    }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).

## Delete a policy

The following code example shows how to delete an IAM policy.

## SDK for JavaScript V3

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
const REGION = "REGION"; // For example, "us-east-1".
// Create an IAM service client object.
const iamClient = new IAMClient({ region: REGION });
export { iamClient };
```

Delete the policy.

```
// Import required AWS SDK clients and commands for Node.js.
import { iamClient } from "./libs/iamClient.js";
import { DeletePolicyCommand } from "@aws-sdk/client-iam";

// Set the parameters.
const params = { PolicyArn: "POLICY_ARN" };

const run = async () => {
  try {
    const data = await iamClient.send(new DeletePolicyCommand(params));
    console.log("Success. Policy deleted.", data);

  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For API details, see [DeletePolicy](#) in *AWS SDK for JavaScript API Reference*.

## Delete a role

The following code example shows how to delete an IAM role.

## SDK for JavaScript V3

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
const REGION = "REGION"; // For example, "us-east-1".
// Create an IAM service client object.
const iamClient = new IAMClient({ region: REGION });
export { iamClient };
```

Delete the role.

```
// Import required AWS SDK clients and commands for Node.js.
import { iamClient } from "./libs/iamClient.js";
import { DeleteRoleCommand } from "@aws-sdk/client-iam";

// Set the parameters.
const params = {
    RoleName: "ROLE_NAME"
}

const run = async () => {
    try {
        const data = await iamClient.send(new DeleteRoleCommand(params));
        console.log("Success. Role deleted.", data);
    } catch (err) {
        console.log("Error", err);
    }
};
run();
```

- For API details, see [DeleteRole](#) in *AWS SDK for JavaScript API Reference*.

## Delete a server certificate

The following code example shows how to delete an IAM server certificate.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
const REGION = "REGION"; // For example, "us-east-1".
// Create an IAM service client object.
const iamClient = new IAMClient({ region: REGION });
export { iamClient };
```

Delete a server certificate.

```
// Import required AWS SDK clients and commands for Node.js.
import { iamClient } from "./libs/iamClient.js";
import { DeleteServerCertificateCommand } from "@aws-sdk/client-iam";

// Set the parameters.
export const params = { ServerCertificateName: "CERTIFICATE_NAME" }; // CERTIFICATE_NAME

export const run = async () => {
    try {
        const data = await iamClient.send(
            new DeleteServerCertificateCommand(params)
        );
        console.log("Success", data);
        return data;
    } catch (err) {
        console.log("Error", err);
    }
};
```

```

## Get a policy

The following code example shows how to get an IAM policy.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
const REGION = "REGION"; // For example, "us-east-1".
// Create an IAM service client object.
const iamClient = new IAMClient({ region: REGION });
export { iamClient };
```

Get the policy.

```
// Import required AWS SDK clients and commands for Node.js.
import { iamClient } from "./libs/iamClient.js";
import { GetPolicyCommand } from "@aws-sdk/client-iam";

// Set the parameters.
const params = {
  PolicyArn: "POLICY_ARN" /* required */,
};

const run = async () => {
  try {
    const data = await iamClient.send(new GetPolicyCommand(params));
    console.log("Success", data.Policy);
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [GetPolicy](#) in [AWS SDK for JavaScript API Reference](#).

### SDK for JavaScript V2

#### Note

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
const REGION = "REGION"; // For example, "us-east-1".
// Create an IAM service client object.
const iamClient = new IAMClient({ region: REGION });
export { iamClient };
```

Get the role.

```
// Import required AWS SDK clients and commands for Node.js.
import { iamClient } from "./libs/iamClient.js";
import { GetRoleCommand } from "@aws-sdk/client-iam";

// Set the parameters.
const params = {
    RoleName: "ROLE_NAME" /* required */
};

const run = async () => {
    try {
        const data = await iamClient.send(new GetRoleCommand(params));
        console.log("Success", data.Role);
    } catch (err) {
```

```
        console.log("Error", err);
    }
};

run();
```

- For API details, see [GetRole](#) in *AWS SDK for JavaScript API Reference*.

## Get a server certificate

The following code example shows how to get an IAM server certificate.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
const REGION = "REGION"; // For example, "us-east-1".
// Create an IAM service client object.
const iamClient = new IAMClient({ region: REGION });
export { iamClient };
```

Get a server certificate.

```
// Import required AWS SDK clients and commands for Node.js.
import { iamClient } from "./libs/iamClient.js";
import { GetServerCertificateCommand } from "@aws-sdk/client-iam";

// Set the parameters.
export const params = { ServerCertificateName: "CERTIFICATE_NAME" }; //CERTIFICATE_NAME

export const run = async () => {
    try {
        const data = await iamClient.send(new GetServerCertificateCommand(params));
        console.log("Success", data);
        return data;
    } catch (err) {
        console.log("Error", err);
    }
};
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [GetServerCertificate](#) in *AWS SDK for JavaScript API Reference*.

### SDK for JavaScript V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
```

```
AWS.config.update({region: 'REGION');

// Create the IAM service object
var iam = new AWS.IAM({apiVersion: '2010-05-08'});

iam.getServerCertificate({ServerCertificateName: 'CERTIFICATE_NAME'}, function(err,
data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data);
  }
});
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [GetServerCertificate](#) in [AWS SDK for JavaScript API Reference](#).

## Get data about the last use of an access key

The following code example shows how to get data about the last use of an IAM access key.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
const REGION = "REGION"; // For example, "us-east-1".
// Create an IAM service client object.
const iamClient = new IAMClient({ region: REGION });
export { iamClient };
```

Get the access key.

```
// Import required AWS SDK clients and commands for Node.js.
import { iamClient } from "./libs/iamClient.js";
import { GetAccessKeyLastUsedCommand } from "@aws-sdk/client-iam";

// Set the parameters.
export const params = { AccessKeyId: "ACCESS_KEY_ID" }; //ACCESS_KEY_ID

export const run = async () => {
  try {
    const data = await iamClient.send(new GetAccessKeyLastUsedCommand(params));
    console.log("Success", data);
    return data;
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [GetAccessKeyLastUsed](#) in [AWS SDK for JavaScript API Reference](#).

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create the IAM service object
var iam = new AWS.IAM({apiVersion: '2010-05-08'});

iam.getAccessKeyLastUsed({AccessKeyId: 'ACCESS_KEY_ID'}, function(err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data.AccessKeyLastUsed);
  }
});
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [GetAccessKeyLastUsed](#) in [AWS SDK for JavaScript API Reference](#).

## Get the account password policy

The following code example shows how to get the IAM account password policy.

## SDK for JavaScript V3

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
const REGION = "REGION"; // For example, "us-east-1".
// Create an IAM service client object.
const iamClient = new IAMClient({ region: REGION });
export { iamClient };
```

Get the account password policy.

```
// Import required AWS SDK clients and commands for Node.js.
import { iamClient } from "./libs/iamClient.js";
import { GetAccountPasswordPolicyCommand } from "@aws-sdk/client-iam";

const run = async () => {
  try {
    const data = await iamClient.send(new GetAccountPasswordPolicyCommand({}));
    console.log("Success", data.PasswordPolicy);
  } catch (err) {
    console.log("Error", err);
  }
};
```

```
run();
```

- For API details, see [GetAccountPasswordPolicy](#) in *AWS SDK for JavaScript API Reference*.

## List SAML providers

The following code example shows how to list SAML providers for IAM.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
const REGION = "REGION"; // For example, "us-east-1".
// Create an IAM service client object.
const iamClient = new IAMClient({ region: REGION });
export { iamClient };
```

List the SAML providers.

```
// Import required AWS SDK clients and commands for Node.js.
import { iamClient } from "./libs/iamClient.js";
import { ListSAMLProvidersCommand } from "@aws-sdk/client-iam";

export const run = async () => {
    try {
        const results = await iamClient.send(new ListSAMLProvidersCommand([]));
        console.log("Success", results);
        return results;
    } catch (err) {
        console.log("Error", err);
    }
}
run();
```

- For API details, see [ListSAMLProviders](#) in *AWS SDK for JavaScript API Reference*.

## List a user's access keys

The following code example shows how to list a user's IAM access keys.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
```

```
const REGION = "REGION"; // For example, "us-east-1".  
// Create an IAM service client object.  
const iamClient = new IAMClient({ region: REGION });  
export { iamClient };
```

List the access keys.

```
// Import required AWS SDK clients and commands for Node.js.  
import { iamClient } from "./libs/iamClient.js";  
import { ListAccessKeysCommand } from "@aws-sdk/client-iam";  
  
// Set the parameters.  
export const params = {  
    MaxItems: 5,  
    UserName: "IAM_USER_NAME", //IAM_USER_NAME  
};  
  
export const run = async () => {  
    try {  
        const data = await iamClient.send(new ListAccessKeysCommand(params));  
        console.log("Success", data);  
        return data;  
    } catch (err) {  
        console.log("Error", err);  
    }  
};  
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [ListAccessKeys](#) in [AWS SDK for JavaScript API Reference](#).

## SDK for JavaScript V2

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Load the AWS SDK for Node.js  
var AWS = require('aws-sdk');  
// Set the region  
AWS.config.update({region: 'REGION'});  
  
// Create the IAM service object  
var iam = new AWS.IAM({apiVersion: '2010-05-08'});  
  
var params = {  
    MaxItems: 5,  
    UserName: 'IAM_USER_NAME'  
};  
  
iam.listAccessKeys(params, function(err, data) {  
    if (err) {  
        console.log("Error", err);  
    } else {  
        console.log("Success", data);  
    }  
});
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).

- For API details, see [ListAccessKeys](#) in *AWS SDK for JavaScript API Reference*.

## List account aliases

The following code example shows how to list IAM account aliases.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
const REGION = "REGION"; // For example, "us-east-1".
// Create an IAM service client object.
const iamClient = new IAMClient({ region: REGION });
export { iamClient };
```

List the account aliases.

```
// Import required AWS SDK clients and commands for Node.js.
import { iamClient } from "./libs/iamClient.js";
import { ListAccountAliasesCommand } from "@aws-sdk/client-iam";

// Set the parameters.
export const params = { MaxItems: 5 };

export const run = async () => {
  try {
    const data = await iamClient.send(new ListAccountAliasesCommand(params));
    console.log("Success", data);
    return data;
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [ListAccountAliases](#) in *AWS SDK for JavaScript API Reference*.

### SDK for JavaScript V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create the IAM service object
var iam = new AWS.IAM({apiVersion: '2010-05-08'});

iam.listAccountAliases({MaxItems: 10}, function(err, data) {
```

```
    if (err) {
      console.log("Error", err);
    } else {
      console.log("Success", data);
    }
});
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [ListAccountAliases](#) in [AWS SDK for JavaScript API Reference](#).

## List groups

The following code example shows how to list IAM groups.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
const REGION = "REGION"; // For example, "us-east-1".
// Create an IAM service client object.
const iamClient = new IAMClient({ region: REGION });
export { iamClient };
```

List the groups.

```
// Import required AWS SDK clients and commands for Node.js.
import { iamClient } from "./libs/iamClient.js";
import {ListGroupsCommand} from "@aws-sdk/client-iam";

// Set the parameters.
export const params = {
  RoleName: 'ROLE_NAME', /* This is a number value. Required */
  Marker: 'MARKER', /* This is a string value. Optional */
  MaxItems: 'MAX_ITEMS' /* This is a number value. Optional */
};

export const run = async () => {
  try {
    const data = await iamClient.send(new ListGroupsCommand({}));
    console.log("Success", data.Groups);
  } catch (err) {
    console.log("Error", err);
  }
}
run();
```

- For API details, see [ListGroups](#) in [AWS SDK for JavaScript API Reference](#).

## List inline policies for a role

The following code example shows how to list inline policies for an IAM role.

## SDK for JavaScript V3

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
const REGION = "REGION"; // For example, "us-east-1".
// Create an IAM service client object.
const iamClient = new IAMClient({ region: REGION });
export { iamClient };
```

List the policies.

```
// Import required AWS SDK clients and commands for Node.js.
import { iamClient } from "./libs/iamClient.js";
import {ListRolePoliciesCommand} from "@aws-sdk/client-iam";

// Set the parameters.
export const params = {
    RoleName: 'ROLE_NAME', /* This is a number value. Required */
    Marker: 'MARKER', /* This is a string value. Optional */
    MaxItems: 'MAX_ITEMS' /* This is a number value. Optional */
};

export const run = async () => {
    try {
        const results = await iamClient.send(new ListRolePoliciesCommand(params));
        console.log("Success", results);
        return results;
    } catch (err) {
        console.log("Error", err);
    }
}
run();
```

- For API details, see [ListRolePolicies in AWS SDK for JavaScript API Reference](#).

## List policies

The following code example shows how to list IAM policies.

## SDK for JavaScript V3

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
const REGION = "REGION"; // For example, "us-east-1".
// Create an IAM service client object.
const iamClient = new IAMClient({ region: REGION });
```

```
export { iamClient };
```

List the policies.

```
// Import required AWS SDK clients and commands for Node.js.
import { iamClient } from "./libs/iamClient.js";
import {ListPoliciesCommand} from "@aws-sdk/client-iam";

// Set the parameters.
export const params = {
    Marker: 'MARKER',
    MaxItems: 'MAX_ITEMS',
    OnlyAttached: "ONLY_ATTACHED", /* Options are "true" or "false"*/
    PathPrefix: 'PATH_PREFIX',
    PolicyUsageFilter: "POLICY_USAGE_FILTER", /* Options are "PermissionsPolicy" or
"PermissionsBoundary"*/
    Scope: "SCOPE" /* Options are "All", "AWS", "Local"*/
};

export const run = async () => {
    try {
        const results = await iamClient.send(new ListPoliciesCommand(params));
        console.log("Success", results);
        return results;
    } catch (err) {
        console.log("Error", err);
    }
};
run();
```

- For API details, see [ListPolicies](#) in *AWS SDK for JavaScript API Reference*.

## List policies attached to a role

The following code example shows how to list policies attached to an IAM role.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
const REGION = "REGION"; // For example, "us-east-1".
// Create an IAM service client object.
const iamClient = new IAMClient({ region: REGION });
export { iamClient };
```

List the policies that are attached to a role.

```
// Import required AWS SDK clients and commands for Node.js.
import { iamClient } from "./libs/iamClient.js";
import {ListAttachedRolePoliciesCommand} from "@aws-sdk/client-iam";
```

```
// Set the parameters.
export const params = {
  RoleName: 'ROLE_NAME' /* required */
};

export const run = async () => {
  try {
    const data = await iamClient.send(new ListAttachedRolePoliciesCommand(params));
    console.log("Success", data.AttachedPolicies);
  } catch (err) {
    console.log("Error", err);
  }
}
run();
```

- For API details, see [ListAttachedRolePolicies](#) in *AWS SDK for JavaScript API Reference*.

## List roles

The following code example shows how to list IAM roles.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
const REGION = "REGION"; // For example, "us-east-1".
// Create an IAM service client object.
const iamClient = new IAMClient({ region: REGION });
export { iamClient };
```

List the roles.

```
// Import required AWS SDK clients and commands for Node.js.
import { iamClient } from "./libs/iamClient.js";
import { ListRolesCommand } from "@aws-sdk/client-iam";

// Set the parameters.
const params = {
  Marker: 'MARKER', // This is a string value.
  MaxItems: 'MAX_ITEMS' // This is a number value.
};

const run = async () => {
  try {
    const results = await iamClient.send(new ListRolesCommand(params));
    console.log("Success", results);
    return results;
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For API details, see [ListRoles](#) in *AWS SDK for JavaScript API Reference*.

## List server certificates

The following code example shows how to list IAM server certificates.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
const REGION = "REGION"; // For example, "us-east-1".
// Create an IAM service client object.
const iamClient = new IAMClient({ region: REGION });
export { iamClient };
```

List the certificates.

```
// Import required AWS SDK clients and commands for Node.js.
import { iamClient } from "./libs/iamClient.js";
import { ListServerCertificatesCommand } from "@aws-sdk/client-iam";

export const run = async () => {
  try {
    const data = await iamClient.send(new ListServerCertificatesCommand({}));
    console.log("Success", data);
    return data;
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [ListServerCertificates](#) in *AWS SDK for JavaScript API Reference*.

### SDK for JavaScript V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create the IAM service object
var iam = new AWS.IAM({apiVersion: '2010-05-08'});

iam.listServerCertificates({}, function(err, data) {
  if (err) {
    console.log("Error", err);
```

```
    } else {
      console.log("Success", data);
    }
});
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [ListServerCertificates](#) in [AWS SDK for JavaScript API Reference](#).

## List users

The following code example shows how to list IAM users.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
const REGION = "REGION"; // For example, "us-east-1".
// Create an IAM service client object.
const iamClient = new IAMClient({ region: REGION });
export { iamClient };
```

List the users.

```
// Import required AWS SDK clients and commands for Node.js.
import { iamClient } from "./libs/iamClient.js";
import { ListUsersCommand } from "@aws-sdk/client-iam";

// Set the parameters.
export const params = { MaxItems: 10 };

export const run = async () => {
  try {
    const data = await iamClient.send(new ListUsersCommand(params));
    return data;
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [ListUsers](#) in [AWS SDK for JavaScript API Reference](#).

### SDK for JavaScript V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');

## Update a server certificate

The following code example shows how to update an IAM server certificate.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
const REGION = "REGION"; // For example, "us-east-1".
// Create an IAM service client object.
const iamClient = new IAMClient({ region: REGION });
export { iamClient };
```

Update a server certificate.

```
// Import required AWS SDK clients and commands for Node.js.
import { iamClient } from "./libs/iamClient.js";
import { UpdateServerCertificateCommand } from "@aws-sdk/client-iam";

// Set the parameters.
export const params = {
  ServerCertificateName: "CERTIFICATE_NAME", //CERTIFICATE_NAME
  NewServerCertificateName: "NEW_CERTIFICATE_NAME", //NEW_CERTIFICATE_NAME
};

export const run = async () => {
```

```
try {
  const data = await iamClient.send(
    new UpdateServerCertificateCommand(params)
  );
  console.log("Success", data);
  return data;
} catch (err) {
  console.log("Error", err);
}
};

run();
```

// Load the AWS SDK for Node.js  
var AWS = require('aws-sdk');  
// Set the region  
AWS.config.update({region: 'REGION'});  
  
// Create the IAM service object  
var iam = new AWS.IAM({apiVersion: '2010-05-08'});  
  
var params = {  
    UserName: process.argv[2],  
    NewUserName: process.argv[3]  
};  
  
iam.updateUser(params, function(err, data) {  
    if (err) {  
        console.log("Error", err);  
    } else {  
        console.log("Success", data);  
    }  
});
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [UpdateUser](#) in [AWS SDK for JavaScript API Reference](#).

## Update an access key

The following code example shows how to update an IAM access key.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
const REGION = "REGION"; // For example, "us-east-1".
// Create an IAM service client object.
const iamClient = new IAMClient({ region: REGION });
export { iamClient };
```

Update the access key.

```
// Import required AWS SDK clients and commands for Node.js.
import { iamClient } from "./libs/iamClient.js";
import { UpdateAccessKeyCommand } from "@aws-sdk/client-iam";

// Set the parameters.
export const params = {
  AccessKeyId: "ACCESS_KEY_ID", //ACCESS_KEY_ID
  Status: "Active",
  UserName: "USER_NAME", //USER_NAME
};

export const run = async () => {
  try {
    const data = await iamClient.send(new UpdateAccessKeyCommand(params));
    console.log("Success", data);
    return data;
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [UpdateAccessKey](#) in [AWS SDK for JavaScript API Reference](#).

### SDK for JavaScript V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
```

```
// Set the region
AWS.config.update({region: 'REGION'});

// Create the IAM service object
var iam = new AWS.IAM({apiVersion: '2010-05-08'});

var params = {
    AccessKeyId: 'ACCESS_KEY_ID',
    Status: 'Active',
    UserName: 'USER_NAME'
};

iam.updateAccessKey(params, function(err, data) {
    if (err) {
        console.log("Error", err);
    } else {
        console.log("Success", data);
    }
});
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [UpdateAccessKey](#) in [AWS SDK for JavaScript API Reference](#).

## Scenarios

### Create a user and assume a role

The following code example shows how to:

- Create a user who has no permissions.
- Create a role that grants permission to list Amazon S3 buckets for the account.
- Add a policy to let the user assume the role.
- Assume the role and list Amazon S3 buckets using temporary credentials.
- Delete the policy, role, and user.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.
import { IAMClient } from "@aws-sdk/client-iam";
// Set the AWS Region.
export const REGION = "REGION"; // For example, "us-east-1".
// Create an Amazon S3 service client object.
export const iamClient = new IAMClient({ region: REGION });
```

Create an IAM user and a role that grants permission to list Amazon S3 buckets. The user has rights only to assume the role. After assuming the role, use temporary credentials to list buckets for the account.

```
// Import required AWS SDK clients and commands for Node.js.
```

```
import { iamClient, REGION } from "../libs/iamClient.js"; // Helper function that
  creates an IAM service client module.
import {
  CreateUserCommand,
  CreateAccessKeyCommand,
  CreatePolicyCommand,
  CreateRoleCommand,
  AttachRolePolicyCommand,
  AttachUserPolicyCommand,
  DeleteAccessKeyCommand,
  DeleteUserCommand,
  DeleteRoleCommand,
  DeletePolicyCommand,
  DetachUserPolicyCommand,
  DetachRolePolicyCommand,
} from "@aws-sdk/client-iam";
import { ListBucketsCommand, S3Client } from "@aws-sdk/client-s3";
import { AssumeRoleCommand, STSClient } from "@aws-sdk/client-sts";

if (process.argv.length < 6) {
  console.log(
    "Usage: node iam_basics.js <user name> <s3 policy name> <role name> <assume
  policy name>\n" +
    "Example: node iam_basics.js test-user my-s3-policy my-iam-role my-assume-role"
  );
}
// Set the parameters.
const region = REGION;
const userName = process.argv[2];
const s3_policy_name = process.argv[3];
const role_name = process.argv[4];
const assume_policy_name = process.argv[5];

// Helper function to delay running the code while the AWS service calls wait for
// responses.
function wait(ms) {
  var start = Date.now();
  var end = start
  while (end < start + ms){
    end = Date.now()
  }
}

## Lambda examples using SDK for JavaScript V3

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for JavaScript V3 with AWS Lambda.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3055\)](#)
- [Scenarios \(p. 3058\)](#)

## Actions

### Create a function

The following code example shows how to create a Lambda function.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
const createFunction = async (funcName, roleArn) => {
  const client = createClientForDefaultRegion(LambdaClient);
  const code = await zip(`.${dirname}../functions/${funcName}`);

  const command = new CreateFunctionCommand({
    Code: { ZipFile: code },
    FunctionName: funcName,
    Role: roleArn,
    Architectures: [Architecture.arm64],
    Handler: "index.handler", // Required when sending a .zip file
```

```
    PackageType: PackageType.Zip, // Required when sending a .zip file
    Runtime: Runtime.nodejs16x, // Required when sending a .zip file
  });

  return client.send(command);
};
```

- For API details, see [CreateFunction](#) in *AWS SDK for JavaScript API Reference*.

## Delete a function

The following code example shows how to delete a Lambda function.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
const deleteFunction = (funcName) => {
  const client = createClientForDefaultRegion(LambdaClient);
  const command = new DeleteFunctionCommand({ FunctionName: funcName });
  return client.send(command);
};
```

- For API details, see [DeleteFunction](#) in *AWS SDK for JavaScript API Reference*.

## Get a function

The following code example shows how to get a Lambda function.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
const getFunction = (funcName) => {
  const client = createClientForDefaultRegion(LambdaClient);
  const command = new GetFunctionCommand({ FunctionName: funcName });
  return client.send(command);
};
```

- For API details, see [GetFunction](#) in *AWS SDK for JavaScript API Reference*.

## Invoke a function

The following code example shows how to invoke a Lambda function.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
const invoke = async (funcName, payload) => {
  const client = createClientForDefaultRegion(LambdaClient);
  const command = new InvokeCommand({
    FunctionName: funcName,
    Payload: JSON.stringify(payload),
    LogType: LogType.Tail,
  });

  const { Payload, LogResult } = await client.send(command);
  const result = Buffer.from(Payload).toString();
  const logs = Buffer.from(LogResult, "base64").toString();
  return { logs, result };
};
```

- For API details, see [Invoke](#) in *AWS SDK for JavaScript API Reference*.

## List functions

The following code example shows how to list Lambda functions.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
const listFunctions = async () => {
  const client = createClientForDefaultRegion(LambdaClient);
  const command = new ListFunctionsCommand({});

  return client.send(command);
};
```

- For API details, see [ListFunctions](#) in *AWS SDK for JavaScript API Reference*.

## Update function code

The following code example shows how to update Lambda function code.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
const updateFunctionCode = async (funcName, newFunc) => {
  const client = createClientForDefaultRegion(LambdaClient);
  const code = await zip(`.${dirname}..functions/${newFunc}`);
  const command = new UpdateFunctionCodeCommand({
    ZipFile: code,
    FunctionName: funcName,
    Architectures: [Architecture.arm64],
    Handler: "index.handler", // Required when sending a .zip file
    PackageType: PackageType.Zip, // Required when sending a .zip file
    Runtime: Runtime.nodejs16x, // Required when sending a .zip file
  });
};
```

```
    });
    return client.send(command);
};
```

- For API details, see [UpdateFunctionCode](#) in *AWS SDK for JavaScript API Reference*.

## Update function configuration

The following code example shows how to update Lambda function configuration.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
const updateFunctionConfiguration = async (funcName) => {
  const client = createClientForDefaultRegion(LambdaClient);
  const config = readFileSync(
    `${dirname}../functions/${funcName}/config.json`
  ).toString();
  const command = new UpdateFunctionConfigurationCommand({
    ...JSON.parse(config),
    FunctionName: funcName,
  });
  return client.send(command);
};
```

- For API details, see [UpdateFunctionConfiguration](#) in *AWS SDK for JavaScript API Reference*.

## Scenarios

### Get started with functions

The following code example shows how to:

- Create an AWS Identity and Access Management (IAM) role that grants Lambda permission to write to logs.
- Create a Lambda function and upload handler code.
- Invoke the function with a single parameter and get results.
- Update the function code and configure its Lambda environment with an environment variable.
- Invoke the function with new parameters and get results. Display the execution log that's returned from the invocation.
- List the functions for your account.
- Delete the IAM role and the Lambda function.

For more information, see [Create a Lambda function with the console](#).

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create an AWS Identity and Access Management (IAM) role that grants Lambda permission to write to logs.

```
log(`Creating role (${NAME_ROLE_LAMBDA})...`);  
const response = await createRole({  
    AssumeRolePolicyDocument: parseString({  
        Version: "2012-10-17",  
        Statement: [  
            {  
                Effect: "Allow",  
                Principal: {  
                    Service: "lambda.amazonaws.com",  
                },  
                Action: "sts:AssumeRole",  
            },  
        ],  
    }),  
    RoleName: NAME_ROLE_LAMBDA,  
});  
  
const attachRolePolicy = async (roleName, policyArn) => {  
    const client = createClientForDefaultRegion(IAMClient);  
    const command = new AttachRolePolicyCommand({  
        PolicyArn: policyArn, // For example, arn:aws:iam::aws:policy/service-role/  
        AWSLambdaBasicExecutionRole  
        RoleName: roleName, // For example, lambda-basic-execution-role  
    });  
  
    return client.send(command);  
};
```

Create a Lambda function and upload handler code.

```
const createFunction = async (funcName, roleArn) => {  
    const client = createClientForDefaultRegion(LambdaClient);  
    const code = await zip(`.${dirname}../functions/${funcName}`);  
  
    const command = new CreateFunctionCommand({  
        Code: { ZipFile: code },  
        FunctionName: funcName,  
        Role: roleArn,  
        Architectures: [Architecture.arm64],  
        Handler: "index.handler", // Required when sending a .zip file  
        PackageType: PackageType.Zip, // Required when sending a .zip file  
        Runtime: Runtime.nodejs16x, // Required when sending a .zip file  
    });  
  
    return client.send(command);  
};
```

Invoke the function with a single parameter and get results.

```
const invoke = async (funcName, payload) => {  
    const client = createClientForDefaultRegion(LambdaClient);  
    const command = new InvokeCommand({  
        FunctionName: funcName,  
        Payload: JSON.stringify(payload),  
        LogType: LogType.Tail,  
    });
```

```
const { Payload, LogResult } = await client.send(command);
const result = Buffer.from(Payload).toString();
const logs = Buffer.from(LogResult, "base64").toString();
return { logs, result };
};
```

Update the function code and configure its Lambda environment with an environment variable.

```
const updateFunctionCode = async (funcName, newFunc) => {
  const client = createClientForDefaultRegion(LambdaClient);
  const code = await zip(`.${dirname}../functions/${newFunc}`);
  const command = new UpdateFunctionCodeCommand({
    ZipFile: code,
    FunctionName: funcName,
    Architectures: [Architecture.arm64],
    Handler: "index.handler", // Required when sending a .zip file
    PackageType: PackageType.Zip, // Required when sending a .zip file
    Runtime: Runtime.nodejs16x, // Required when sending a .zip file
  });

  return client.send(command);
};

const updateFunctionConfiguration = async (funcName) => {
  const client = createClientForDefaultRegion(LambdaClient);
  const config = readFileSync(
    `.${dirname}../functions/${funcName}/config.json`
  ).toString();
  const command = new UpdateFunctionConfigurationCommand({
    ...JSON.parse(config),
    FunctionName: funcName,
  });
  return client.send(command);
};
```

List the functions for your account.

```
const listFunctions = async () => {
  const client = createClientForDefaultRegion(LambdaClient);
  const command = new ListFunctionsCommand({});

  return client.send(command);
};
```

Delete the IAM role and the Lambda function.

```
const deleteRole = (roleName) => {
  const client = createClientForDefaultRegion(IAMClient);
  const command = new DeleteRoleCommand({ RoleName: roleName });
  return client.send(command);
};

const deleteFunction = (funcName) => {
  const client = createClientForDefaultRegion(LambdaClient);
  const command = new DeleteFunctionCommand({ FunctionName: funcName });
  return client.send(command);
};
```

## Amazon Personalize examples using SDK for JavaScript V3

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for JavaScript V3 with Amazon Personalize.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3061\)](#)

## Actions

### Create a batch interface job

The following code example shows how to create a Amazon Personalize batch interface job.

#### SDK for JavaScript V3

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Get service clients module and commands using ES6 syntax.
import { CreateBatchInferenceJobCommand } from
  "@aws-sdk/client-personalize";
import { personalizeClient } from "./libs/personalizeClients.js";

// Or, create the client here.
// const personalizeClient = new PersonalizeClient({ region: "REGION"});

// Set the batch inference job's parameters.

export const createBatchInferenceJobParam = {
  jobName: 'JOB_NAME',
  jobInput: { /* required */
    s3DataSource: { /* required */
      path: 'INPUT_PATH', /* required */
      // kmsKeyArn: 'INPUT_KMS_KEY_ARN' /* optional */
    }
  },
  jobOutput: { /* required */
    s3DataDestination: { /* required */
      path: 'OUTPUT_PATH', /* required */
    }
  }
};
```

```
// kmsKeyArn: 'OUTPUT_KMS_KEY_ARN' /* optional */
    }
},
roleArn: 'ROLE_ARN', /* required */
solutionVersionArn: 'SOLUTION_VERSION_ARN', /* required */
numResults: 20 /* optional integer*/
};

export const run = async () => {
  try {
    const response = await personalizeClient.send(new
CreateBatchInferenceJobCommand(createBatchInferenceJobParam));
    console.log("Success", response);
    return response; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For API details, see [CreateBatchInferenceJob](#) in *AWS SDK for JavaScript API Reference*.

## Create a batch segment job

The following code example shows how to create a Amazon Personalize batch segment job.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Get service clients module and commands using ES6 syntax.
import { CreateBatchSegmentJobCommand } from
  "@aws-sdk/client-personalize";
import { personalizeClient } from "./libs/personalizeClients.js";

// Or, create the client here.
// const personalizeClient = new PersonalizeClient({ region: "REGION"});

// Set the batch segment job's parameters.

export const createBatchSegmentJobParam = {
  jobName: 'NAME',
  jobInput: {
    /* required */
    s3DataSource: { /* required */
      path: 'INPUT_PATH', /* required */
      // kmsKeyArn: 'INPUT_KMS_KEY_ARN' /* optional */
    }
  },
  jobOutput: { /* required */
    s3DataDestination: { /* required */
      path: 'OUTPUT_PATH', /* required */
      // kmsKeyArn: 'OUTPUT_KMS_KEY_ARN' /* optional */
    }
  },
  roleArn: 'ROLE_ARN', /* required */
  solutionVersionArn: 'SOLUTION_VERSION_ARN', /* required */
  numResults: 20 /* optional */
};
```

```
export const run = async () => {
  try {
    const response = await personalizeClient.send(new
CreateBatchSegmentJobCommand(createBatchSegmentJobParam));
    console.log("Success", response);
    return response; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For API details, see [CreateBatchSegmentJob](#) in *AWS SDK for JavaScript API Reference*.

## Create a campaign

The following code example shows how to create a Amazon Personalize campaign.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Get service clients module and commands using ES6 syntax.

import { CreateCampaignCommand } from
  "@aws-sdk/client-personalize";
import { personalizeClient } from "./libs/personalizeClients.js";

// Or, create the client here.
// const personalizeClient = new PersonalizeClient({ region: "REGION"});

// Set the campaign's parameters.
export const createCampaignParam = {
  solutionVersionArn: 'SOLUTION_VERSION_ARN', /* required */
  name: 'NAME', /* required */
  minProvisionedTPS: 1 /* optional integer */
}

export const run = async () => {
  try {
    const response = await personalizeClient.send(new
CreateCampaignCommand(createCampaignParam));
    console.log("Success", response);
    return response; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For API details, see [CreateCampaign](#) in *AWS SDK for JavaScript API Reference*.

## Create a dataset

The following code example shows how to create a Amazon Personalize dataset.

## SDK for JavaScript V3

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Get service clients module and commands using ES6 syntax.
import { CreateDatasetCommand } from
  "@aws-sdk/client-personalize";
import { personalizeClient } from "./libs/personalizeClients.js";

// Or, create the client here.
// const personalizeClient = new PersonalizeClient({ region: "REGION"});

// Set the dataset's parameters.
export const createDatasetParam = {
  datasetGroupArn: 'DATASET_GROUP_ARN', /* required */
  datasetType: 'DATASET_TYPE', /* required */
  name: 'NAME', /* required */
  schemaArn: 'SCHEMA_ARN' /* required */
}

export const run = async () => {
  try {
    const response = await personalizeClient.send(new
CreateDatasetCommand(createDatasetParam));
    console.log("Success", response);
    return response; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For API details, see [CreateDataset](#) in *AWS SDK for JavaScript API Reference*.

## Create a dataset export job

The following code example shows how to create a Amazon Personalize dataset export job.

## SDK for JavaScript V3

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Get service clients module and commands using ES6 syntax.
import { CreateDatasetExportJobCommand } from
  "@aws-sdk/client-personalize";
import { personalizeClient } from "./libs/personalizeClients.js";

// Or, create the client here.
// const personalizeClient = new PersonalizeClient({ region: "REGION"});

// Set the export job parameters.
export const datasetExportJobParam = {
  datasetArn: 'DATASET_ARN', /* required */
  jobOutput: {
    s3DataDestination: {
```

```
        path: 'S3_DESTINATION_PATH' /* required */  
        //kmsKeyArn: 'ARN' /* include if your bucket uses AWS KMS for encryption  
    },  
},  
jobName: 'NAME',/* required */  
roleArn: 'ROLE_ARN' /* required */  
}  
  
export const run = async () => {  
    try {  
        const response = await personalizeClient.send(new  
CreateDatasetExportJobCommand(datasetExportJobParam));  
        console.log("Success", response);  
        return response; // For unit tests.  
    } catch (err) {  
        console.log("Error", err);  
    }  
};  
run();
```

- For API details, see [CreateDatasetExportJob](#) in *AWS SDK for JavaScript API Reference*.

## Create a dataset group

The following code example shows how to create a Amazon Personalize dataset group.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Get service clients module and commands using ES6 syntax.  
  
import { CreateDatasetGroupCommand } from  
    "@aws-sdk/client-personalize";  
import { personalizeClient } from "./libs/personalizeClients.js";  
  
// Or, create the client here.  
// const personalizeClient = new PersonalizeClient({ region: "REGION" });  
  
// Set the dataset group parameters.  
export const createDatasetGroupParam = {  
    name: 'NAME' /* required */  
}  
  
export const run = async (createDatasetGroupParam) => {  
    try {  
        const response = await personalizeClient.send(new  
CreateDatasetGroupCommand(createDatasetGroupParam));  
        console.log("Success", response);  
        return "Run successfully"; // For unit tests.  
    } catch (err) {  
        console.log("Error", err);  
    }  
};  
run(createDatasetGroupParam);
```

Create a domain dataset group.

```
// Get service clients module and commands using ES6 syntax.
import { CreateDatasetGroupCommand } from
  "@aws-sdk/client-personalize";
import { personalizeClient } from "./libs/personalizeClients.js";

// Or, create the client here.
// const personalizeClient = new PersonalizeClient({ region: "REGION"});

// Set the domain dataset group parameters.
export const domainDatasetGroupParams = {
  name: 'NAME', /* required */
  domain: 'DOMAIN' /* required for a domain dsg, specify ECOMMERCE or VIDEO_ON_DEMAND */
}

export const run = async () => {
  try {
    const response = await personalizeClient.send(new
CreateDatasetGroupCommand(domainDatasetGroupParams));
    console.log("Success", response);
    return response; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For API details, see [CreateDatasetGroup](#) in *AWS SDK for JavaScript API Reference*.

## Create a dataset import job

The following code example shows how to create a Amazon Personalize dataset import job.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Get service clients module and commands using ES6 syntax.
import {CreateDatasetImportJobCommand } from
  "@aws-sdk/client-personalize";
import { personalizeClient } from "./libs/personalizeClients.js";

// Or, create the client here.
// const personalizeClient = new PersonalizeClient({ region: "REGION"});

// Set the dataset import job parameters.
export const datasetImportJobParam = {
  datasetArn: 'DATASET_ARN', /* required */
  dataSource: { /* required */
    dataLocation: 'S3_PATH'
  },
  jobName: 'NAME',/* required */
  roleArn: 'ROLE_ARN' /* required */
}

export const run = async () => {
  try {
    const response = await personalizeClient.send(new
CreateDatasetImportJobCommand(datasetImportJobParam));
```

```
    console.log("Success", response);
    return response; // For unit tests.
} catch (err) {
    console.log("Error", err);
}
};

run();
```

- For API details, see [CreateDatasetImportJob](#) in *AWS SDK for JavaScript API Reference*.

## Create a domain schema

The following code example shows how to create a Amazon Personalize domain schema.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Get service clients module and commands using ES6 syntax.
import { CreateSchemaCommand } from
    "@aws-sdk/client-personalize";
import { personalizeClient } from "./libs/personalizeClients.js";

// Or, create the client here.
// const personalizeClient = new PersonalizeClient({ region: "REGION"});

import fs from 'fs';

let schemaFilePath = "SCHEMA_PATH";
let mySchema = "";

try {
    mySchema = fs.readFileSync(schemaFilePath).toString();
} catch (err) {
    mySchema = 'TEST' // for unit tests.
}

// Set the domain schema parameters.
export const createDomainSchemaParam = {
    name: 'NAME', /* required */
    schema: mySchema, /* required */
    domain: 'DOMAIN' /* required for a domain dataset group, specify ECOMMERCE or
VIDEO_ON_DEMAND */
};

export const run = async () => {
    try {
        const response = await personalizeClient.send(new
CreateSchemaCommand(createDomainSchemaParam));
        console.log("Success", response);
        return response; // For unit tests.
    } catch (err) {
        console.log("Error", err);
    }
};
run();
```

- For API details, see [CreateSchema](#) in *AWS SDK for JavaScript API Reference*.

## Create a filter

The following code example shows how to create a Amazon Personalize filter.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Get service clients module and commands using ES6 syntax.
import { CreateFilterCommand } from
  "@aws-sdk/client-personalize";
import { personalizeClient } from "./libs/personalizeClients.js";
// Or, create the client here.
// const personalizeClient = new PersonalizeClient({ region: "REGION"});

// Set the filter's parameters.
export const createFilterParam = {
  datasetGroupArn: 'DATASET_GROUP_ARN', /* required */
  name: 'NAME', /* required */
  filterExpression: 'FILTER_EXPRESSION' /*required */
}

export const run = async () => {
  try {
    const response = await personalizeClient.send(new
CreateFilterCommand(createFilterParam));
    console.log("Success", response);
    return response; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For API details, see [CreateFilter](#) in *AWS SDK for JavaScript API Reference*.

## Create a recommender

The following code example shows how to create a Amazon Personalize recommender.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Get service clients module and commands using ES6 syntax.
import { CreateRecommenderCommand } from
  "@aws-sdk/client-personalize";
import { personalizeClient } from "./libs/personalizeClients.js";

// Or, create the client here.
// const personalizeClient = new PersonalizeClient({ region: "REGION"});

// Set the recommender's parameters.
export const createRecommenderParam = {
```

```
    name: 'NAME', /* required */
    recipeArn: 'RECIPE_ARN', /* required */
    datasetGroupArn: 'DATASET_GROUP_ARN' /* required */
}

export const run = async () => {
  try {
    const response = await personalizeClient.send(new
CreateRecommenderCommand(createRecommenderParam));
    console.log("Success", response);
    return response; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};

run();
```

- For API details, see [CreateRecommender](#) in *AWS SDK for JavaScript API Reference*.

## Create a schema

The following code example shows how to create a Amazon Personalize schema.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Get service clients module and commands using ES6 syntax.
import { CreateSchemaCommand } from
  "@aws-sdk/client-personalize";
import { personalizeClient } from "./libs/personalizeClients.js";

// Or, create the client here.
// const personalizeClient = new PersonalizeClient({ region: "REGION"});

import fs from 'fs';

let schemaFilePath = "SCHEMA_PATH";
let mySchema = "";

try {
  mySchema = fs.readFileSync(schemaFilePath).toString();
} catch (err) {
  mySchema = 'TEST' // For unit tests.
}
// Set the schema parameters.
export const createSchemaParam = {
  name: 'NAME', /* required */
  schema: mySchema /* required */
};

export const run = async () => {
  try {
    const response = await personalizeClient.send(new
CreateSchemaCommand(createSchemaParam));
    console.log("Success", response);
    return response; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
```

```
    }
};

run();
```

- For API details, see [CreateSchema](#) in *AWS SDK for JavaScript API Reference*.

## Create a solution

The following code example shows how to create a Amazon Personalize solution.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Get service clients module and commands using ES6 syntax.
import { CreateSolutionCommand } from
  "@aws-sdk/client-personalize";
import { personalizeClient } from "./libs/personalizeClients.js";
// Or, create the client here.
// const personalizeClient = new PersonalizeClient({ region: "REGION"});

// Set the solution parameters.
export const createSolutionParam = {
  datasetGroupArn: 'DATASET_GROUP_ARN', /* required */
  recipeArn: 'RECIPE_ARN', /* required */
  name: 'NAME' /* required */
}

export const run = async () => {
  try {
    const response = await personalizeClient.send(new
CreateSolutionCommand(createSolutionParam));
    console.log("Success", response);
    return response; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For API details, see [CreateSolution](#) in *AWS SDK for JavaScript API Reference*.

## Create a solution version

The following code example shows how to create a Amazon Personalize solution.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Get service clients module and commands using ES6 syntax.
import { CreateSolutionVersionCommand } from
```

```
    "@aws-sdk/client-personalize";
import { personalizeClient } from "./libs/personalizeClients.js";
// Or, create the client here.
// const personalizeClient = new PersonalizeClient({ region: "REGION"});

// Set the solution version parameters.
export const solutionVersionParam = {
  solutionArn: 'SOLUTION_ARN' /* required */
}

export const run = async () => {
  try {
    const response = await personalizeClient.send(new
CreateSolutionVersionCommand(solutionVersionParam));
    console.log("Success", response);
    return response; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For API details, see [CreateSolutionVersion](#) in *AWS SDK for JavaScript API Reference*.

## Create an event tracker

The following code example shows how to create a Amazon Personalize event tracker.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Get service clients module and commands using ES6 syntax.
import { CreateEventTrackerCommand } from
  "@aws-sdk/client-personalize";
import { personalizeClient } from "./libs/personalizeClients.js";

// Or, create the client here.
// const personalizeClient = new PersonalizeClient({ region: "REGION"});

// Set the event tracker's parameters.
export const createEventTrackerParam = {
  datasetGroupArn: 'DATASET_GROUP_ARN', /* required */
  name: 'NAME', /* required */
}

export const run = async () => {
  try {
    const response = await personalizeClient.send(new
CreateEventTrackerCommand(createEventTrackerParam));
    console.log("Success", response);
    return response; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

## Import real-time interaction event data

The following code example shows how to import real-time interaction event data into Amazon Personalize Events.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Get service clients module and commands using ES6 syntax.
import { PutItemsCommand } from
  "@aws-sdk/client-personalize-events";
import { personalizeEventsClient } from "./libs/personalizeClients.js";
// Or, create the client here.
// const personalizeEventsClient = new PersonalizeEventsClient({ region: "REGION"});

// Set the put items parameters. For string properties and values, use the \ character
// to escape quotes.
var putItemsParam = {
  datasetArn: 'DATASET_ARN', /* required */
  items: [ /* required */
    {
      'itemId': 'ITEM_ID', /* required */
      'properties': "{\"PROPERTY1_NAME\": \"PROPERTY1_VALUE\", \"PROPERTY2_NAME\": \"PROPERTY2_VALUE\", \"PROPERTY3_NAME\": \"PROPERTY3_VALUE\"}"} /* optional */
    }
  ];
};

export const run = async () => {
  try {
    const response = await personalizeEventsClient.send(new
PutItemsCommand(putItemsParam));
    console.log("Success!", response);
    return response; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

## Actions

### Import real-time interaction event data

The following code example shows how to import real-time interaction event data into Amazon Personalize Events.

#### SDK for JavaScript V3

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Get service clients module and commands using ES6 syntax.
import { PutEventsCommand } from
  "@aws-sdk/client-personalize-events";
import { personalizeEventsClient } from "./libs/personalizeClients.js";
// Or, create the client here.
// const personalizeEventsClient = new PersonalizeEventsClient({ region: "REGION"});

// Convert your UNIX timestamp to a Date.
const sentAtDate = new Date(1613443801 * 1000) // 1613443801 is a testing value.
Replace it with your sentAt timestamp in UNIX format.

// Set put events parameters.
var putEventsParam = {
  eventList: [           /* required */
    {
      eventType: 'EVENT_TYPE',      /* required */
      sentAt: sentAtDate,          /* required, must be a Date with js */
      eventId: 'EVENT_ID',        /* optional */
      itemId: 'ITEM_ID'          /* optional */
    }
  ],
  sessionId: 'SESSION_ID',      /* required */
  trackingId: 'TRACKING_ID',   /* required */
  userId: 'USER_ID'            /* required */
};
export const run = async () => {
  try {
    const response = await personalizeEventsClient.send(new
PutEventsCommand(putEventsParam));
    console.log("Success!", response);
    return response; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For API details, see [PutEvents](#) in [AWS SDK for JavaScript API Reference](#).

### Incrementally import a user

The following code example shows how to incrementally import a user into Amazon Personalize Events.

## SDK for JavaScript V3

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Get service clients module and commands using ES6 syntax.
import { PutUsersCommand } from
  "@aws-sdk/client-personalize-events";
import { personalizeEventsClient } from "./libs/personalizeClients.js";
// Or, create the client here.
// const personalizeEventsClient = new PersonalizeEventsClient({ region: "REGION"});

// Set the put users parameters. For string properties and values, use the \ character
// to escape quotes.
var putUsersParam = {
  datasetArn: "DATASET_ARN",
  users: [
    {
      'userId': 'USER_ID',
      'properties': "{\"PROPERTY1_NAME\": \"PROPERTY1_VALUE\"}"
    }
  ]
};
export const run = async () => {
  try {
    const response = await personalizeEventsClient.send(new
PutUsersCommand(putUsersParam));
    console.log("Success!", response);
    return response; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

## Actions

### Get recommendations (custom dataset group)

The following code example shows how to get Amazon Personalize Runtime ranked recommendations.

## SDK for JavaScript V3

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Get service clients module and commands using ES6 syntax.
import { GetPersonalizedRankingCommand } from
  "@aws-sdk/client-personalize-runtime";
import { personalizeRuntimeClient } from "./libs/personalizeClients.js";
// Or, create the client here.
// const personalizeRuntimeClient = new PersonalizeRuntimeClient({ region: "REGION"});

// Set the ranking request parameters.
export const getPersonalizedRankingParam = {
  campaignArn: "CAMPAIGN_ARN", /* required */
  userId: 'USER_ID', /* required */
  inputList: ["ITEM_ID_1", "ITEM_ID_2", "ITEM_ID_3", "ITEM_ID_4"]
}

export const run = async () => {
  try {
    const response = await personalizeRuntimeClient.send(new
      GetPersonalizedRankingCommand(getPersonalizedRankingParam));
    console.log("Success!", response);
    return response; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For API details, see [GetPersonalizedRanking](#) in *AWS SDK for JavaScript API Reference*.

## Get recommendations from a recommender (domain dataset group)

The following code example shows how to get Amazon Personalize Runtime Runtime recommendations.

## SDK for JavaScript V3

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Get service clients module and commands using ES6 syntax.
import { GetRecommendationsCommand } from
  "@aws-sdk/client-personalize-runtime";

import { personalizeRuntimeClient } from "./libs/personalizeClients.js";
// Or, create the client here.
// const personalizeRuntimeClient = new PersonalizeRuntimeClient({ region: "REGION"});

// Set the recommendation request parameters.
export const getRecommendationsParam = {
  campaignArn: 'CAMPAIGN_ARN', /* required */
  userId: 'USER_ID', /* required */
  numResults: 15 /* optional */
}
```

```
export const run = async () => {
  try {
    const response = await personalizeRuntimeClient.send(new
GetRecommendationsCommand(getRecommendationsParam));
    console.log("Success!", response);
    return response; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

Get recommendation with a filter (custom dataset group).

```
// Get service clients module and commands using ES6 syntax.
import { GetRecommendationsCommand } from
  "@aws-sdk/client-personalize-runtime";
import { personalizeRuntimeClient } from "./libs/personalizeClients.js";
// Or, create the client here.
// const personalizeRuntimeClient = new PersonalizeRuntimeClient({ region: "REGION"});

// Set the recommendation request parameters.
export const getRecommendationsParam = {
  recommenderArn: 'RECOMMENDER_ARN', /* required */
  userId: 'USER_ID', /* required */
  numResults: 15 /* optional */
}

export const run = async () => {
  try {
    const response = await personalizeRuntimeClient.send(new
GetRecommendationsCommand(getRecommendationsParam));
    console.log("Success!", response);
    return response; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

Get filtered recommendations from a recommender created in a domain dataset group.

```
// Get service clients module and commands using ES6 syntax.
import { GetRecommendationsCommand } from
  "@aws-sdk/client-personalize-runtime";
import { personalizeRuntimeClient } from "./libs/personalizeClients.js";
// Or, create the client here:
// const personalizeRuntimeClient = new PersonalizeRuntimeClient({ region: "REGION"});

// Set recommendation request parameters.
export const getRecommendationsParam = {
  campaignArn: 'CAMPAIGN_ARN', /* required */
  userId: 'USER_ID', /* required */
  numResults: 15, /* optional */
  filterArn: 'FILTER_ARN', /* required to filter recommendations */
  filterValues: {
    "PROPERTY": "\"VALUE\""
      /* Only required if your filter has a placeholder
parameter */
  }
}
```

```
export const run = async () => {
  try {
    const response = await personalizeRuntimeClient.send(new
GetRecommendationsCommand(getRecommendationsParam));
    console.log("Success!", response);
    return response; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For API details, see [GetRecommendations](#) in *AWS SDK for JavaScript API Reference*.

## Amazon Pinpoint examples using SDK for JavaScript V3

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for JavaScript V3 with Amazon Pinpoint.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

### Send email and text messages

The following code example shows how to send email and text messages with Amazon Pinpoint.

#### SDK for JavaScript V3

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { PinpointClient } from "@aws-sdk/client-pinpoint";
// Set the AWS Region.
const REGION = "us-east-1";
//Set the MediaConvert Service Object
const pinClient = new PinpointClient({region: REGION});
export { pinClient };
```

Send an email message.

```
// Import required AWS SDK clients and commands for Node.js
import { SendMessagesCommand } from "@aws-sdk/client-pinpoint";
import { pinClient } from "./libs/pinClient.js";

// The FromAddress must be verified in SES.
const fromAddress = "FROM_ADDRESS";
```

```
const toAddress = "TO_ADDRESS";
const projectId = "PINPOINT_PROJECT_ID";

// The subject line of the email.
var subject = "Amazon Pinpoint Test (AWS SDK for JavaScript in Node.js)";

// The email body for recipients with non-HTML email clients.
var body_text = `Amazon Pinpoint Test (SDK for JavaScript in Node.js)
-----
This email was sent with Amazon Pinpoint using the AWS SDK for JavaScript in Node.js.
For more information, see https://aws.amazon.com/sdk-for-node-js/`;

// The body of the email for recipients whose email clients support HTML content.
var body_html = `<html>
<head></head>
<body>
  <h1>Amazon Pinpoint Test (SDK for JavaScript in Node.js)</h1>
  <p>This email was sent with
    <a href='https://aws.amazon.com/pinpoint/'>the Amazon Pinpoint Email API</a> using
    the
    <a href='https://aws.amazon.com/sdk-for-node-js/'>
      AWS SDK for JavaScript in Node.js</a>.</p>
</body>
</html>`;

// The character encoding for the subject line and message body of the email.
var charset = "UTF-8";

const params = {
  ApplicationId: projectId,
  MessageRequest: {
    Addresses: {
      [toAddress]: {
        ChannelType: "EMAIL",
      },
    },
    MessageConfiguration: {
      EmailMessage: {
        FromAddress: fromAddress,
        SimpleEmail: {
          Subject: {
            Charset: charset,
            Data: subject,
          },
          HtmlPart: {
            Charset: charset,
            Data: body_html,
          },
          TextPart: {
            Charset: charset,
            Data: body_text,
          },
        },
      },
    },
  },
};

const run = async () => {
  try {
    const data = await pinClient.send(new SendMessagesCommand(params));

    const {
      MessageResponse: { Result },
    } = data;
```

```
    const recipientResult = Result[toAddress];

    if (recipientResult.StatusCode !== 200) {
        throw new Error(recipientResult.StatusMessage);
    } else {
        console.log(recipientResult.MessageId);
    }
} catch (err) {
    console.log(err.message);
}
};

run();
```

Send an SMS message.

```
// Import required AWS SDK clients and commands for Node.js
import { SendMessagesCommand } from "@aws-sdk/client-pinpoint";
import { pinClient } from "./libs/pinClient.js";

("use strict");

/* The phone number or short code to send the message from. The phone number
or short code that you specify has to be associated with your Amazon Pinpoint
account. For best results, specify long codes in E.164 format. */

## Actions

### Create a cluster

The following code example shows how to create an Amazon Redshift cluster.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
const { RedshiftClient } = require("@aws-sdk/client-redshift");
// Set the AWS Region.
const REGION = "REGION";
//Set the Redshift Service Object
const redshiftClient = new RedshiftClient({ region: REGION });
export { redshiftClient };
```

Create the cluster.

```
// Import required AWS SDK clients and commands for Node.js
import { CreateClusterCommand } from "@aws-sdk/client-redshift";
import { redshiftClient } from "./libs/redshiftClient.js";

const params = {
    ClusterIdentifier: "CLUSTER_NAME", // Required
    NodeType: "NODE_TYPE", //Required
    MasterUsername: "MASTER_USER_NAME", // Required - must be lowercase
    MasterUserPassword: "MASTER_USER_PASSWORD", // Required - must contain at least one
    uppercase letter, and one number
    ClusterType: "CLUSTER_TYPE", // Required
    IAMRoleARN: "IAM_ROLE_ARN", // Optional - the ARN of an IAM role with permissions
    your cluster needs to access other AWS services on your behalf, such as Amazon S3.
    ClusterSubnetGroupName: "CLUSTER_SUBNET_GROUPNAME", //Optional - the name of a
    cluster subnet group to be associated with this cluster. Defaults to 'default' if not
    specified.
    DBName: "DATABASE_NAME", // Optional - defaults to 'dev' if not specified
    Port: "PORT_NUMBER", // Optional - defaults to '5439' if not specified
};

const run = async () => {
    try {
        const data = await redshiftClient.send(new CreateClusterCommand(params));
        console.log(
            "Cluster " + data.Cluster.ClusterIdentifier + " successfully created"
        );
        return data; // For unit tests.
    } catch (err) {
        console.log("Error", err);
    }
};
run();
```

- For API details, see [CreateCluster](#) in *AWS SDK for JavaScript API Reference*.

## Delete a cluster

The following code example shows how to delete an Amazon Redshift cluster.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
const { RedshiftClient } = require("@aws-sdk/client-redshift");
```

```
// Set the AWS Region.  
const REGION = "REGION";  
//Set the Redshift Service Object  
const redshiftClient = new RedshiftClient({ region: REGION });  
export { redshiftClient };
```

Create the cluster.

```
// Import required AWS SDK clients and commands for Node.js  
import { DeleteClusterCommand } from "@aws-sdk/client-redshift";  
import { redshiftClient } from "./libs/redshiftClient.js";  
  
const params = {  
    ClusterIdentifier: "CLUSTER_NAME",  
    SkipFinalClusterSnapshot: false,  
    FinalClusterSnapshotIdentifier: "CLUSTER_SNAPSHOT_ID",  
};  
  
const run = async () => {  
    try {  
        const data = await redshiftClient.send(new DeleteClusterCommand(params));  
        console.log("Success, cluster deleted. ", data);  
        return data; // For unit tests.  
    } catch (err) {  
        console.log("Error", err);  
    }  
};  
run();
```

- For API details, see [DeleteCluster](#) in *AWS SDK for JavaScript API Reference*.

## Describe your clusters

The following code example shows how to describe your Amazon Redshift clusters.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
const { RedshiftClient } = require("@aws-sdk/client-redshift");  
// Set the AWS Region.  
const REGION = "REGION";  
//Set the Redshift Service Object  
const redshiftClient = new RedshiftClient({ region: REGION });  
export { redshiftClient };
```

Describe your clusters.

```
// Import required AWS SDK clients and commands for Node.js  
import { DescribeClustersCommand } from "@aws-sdk/client-redshift";  
import { redshiftClient } from "./libs/redshiftClient.js";  
  
const params = {  
    ClusterIdentifier: "CLUSTER_NAME",
```

```
};

const run = async () => {
  try {
    const data = await redshiftClient.send(new DescribeClustersCommand(params));
    console.log("Success", data);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For API details, see [DescribeClusters in AWS SDK for JavaScript API Reference](#).

## Modify a cluster

The following code example shows how to modify an Amazon Redshift cluster.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
const { RedshiftClient } = require("@aws-sdk/client-redshift");
// Set the AWS Region.
const REGION = "REGION";
//Set the Redshift Service Object
const redshiftClient = new RedshiftClient({ region: REGION });
export { redshiftClient };
```

Modify a cluster.

```
// Import required AWS SDK clients and commands for Node.js
import { ModifyClusterCommand } from "@aws-sdk/client-redshift";
import { redshiftClient } from "./libs/redshiftClient.js";

// Set the parameters
const params = {
  ClusterIdentifier: "CLUSTER_NAME",
  MasterUserPassword: "NEW_MASTER_USER_PASSWORD",
};

const run = async () => {
  try {
    const data = await redshiftClient.send(new ModifyClusterCommand(params));
    console.log("Success was modified.", data);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For API details, see [ModifyCluster in AWS SDK for JavaScript API Reference](#).

## Amazon S3 examples using SDK for JavaScript V3

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for JavaScript V3 with Amazon Simple Storage Service.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

- [Actions \(p. 3087\)](#)
- [Scenarios \(p. 3105\)](#)

## Actions

### Add CORS rules to a bucket

The following code example shows how to add cross-origin resource sharing (CORS) rules to an S3 bucket.

#### SDK for JavaScript V3

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.  
import { S3Client } from "@aws-sdk/client-s3";  
// Set the AWS Region.  
const REGION = "us-east-1";  
// Create an Amazon S3 service client object.  
const s3Client = new S3Client({ region: REGION });  
export { s3Client };
```

Add a CORS rule.

```
// Import required AWS-SDK clients and commands for Node.js.  
import { PutBucketCorsCommand } from "@aws-sdk/client-s3";  
import { s3Client } from "./libs/s3Client.js"; // Helper function that creates an  
// Amazon S3 service client module.  
  
// Set parameters.  
// Create initial parameters JSON for putBucketCors.  
const thisConfig = {  
    AllowedHeaders: ["Authorization"],  
    AllowedMethods: [],  
    AllowedOrigins: ["*"],  
    ExposeHeaders: [],  
    MaxAgeSeconds: 3000,  
};  
  
// Assemble the list of allowed methods based on command line parameters  
const allowedMethods = [];  
process.argv.forEach(function (val) {
```

```
if (val.toUpperCase() === "POST") {
    allowedMethods.push("POST");
}
if (val.toUpperCase() === "GET") {
    allowedMethods.push("GET");
}
if (val.toUpperCase() === "PUT") {
    allowedMethods.push("PUT");
}
if (val.toUpperCase() === "PATCH") {
    allowedMethods.push("PATCH");
}
if (val.toUpperCase() === "DELETE") {
    allowedMethods.push("DELETE");
}
if (val.toUpperCase() === "HEAD") {
    allowedMethods.push("HEAD");
}
});

// Copy the array of allowed methods into the config object
thisConfig.AllowedMethods = allowedMethods;

// Create an array of configs then add the config object to it.
const corsRules = new Array(thisConfig);

// Create CORS parameters.
export const corsParams = {
    Bucket: "BUCKET_NAME",
    CORSConfiguration: { CORSRules: corsRules },
};

export async function run() {
    try {
        const data = await s3Client.send(new PutBucketCorsCommand(corsParams));
        console.log("Success", data);
        return data; // For unit tests.
    } catch (err) {
        console.log("Error", err);
    }
}
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [PutBucketCors](#) in [AWS SDK for JavaScript API Reference](#).

## Add a policy to a bucket

The following code example shows how to add a policy to an S3 bucket.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.
import { S3Client } from "@aws-sdk/client-s3";
// Set the AWS Region.
const REGION = "us-east-1";
```

```
// Create an Amazon S3 service client object.  
const s3Client = new S3Client({ region: REGION });  
export { s3Client };
```

Add the policy.

```
// Import required AWS SDK clients and commands for Node.js.  
import { CreateBucketCommand, PutBucketPolicyCommand } from "@aws-sdk/client-s3";  
import { s3Client } from "./libs/s3Client.js"; // Helper function that creates an  
Amazon S3 service client module.  
  
const BUCKET_NAME = "BUCKET_NAME";  
export const bucketParams = {  
    Bucket: BUCKET_NAME,  
};  
// Create the policy in JSON for the S3 bucket.  
const readOnlyAnonUserPolicy = {  
    Version: "2012-10-17",  
    Statement: [  
        {  
            Sid: "AddPerm",  
            Effect: "Allow",  
            Principal: "*",  
            Action: ["s3:GetObject"],  
            Resource: ["*"],  
        },  
    ],  
};  
  
// Create selected bucket resource string for bucket policy.  
const bucketResource = "arn:aws:s3:::" + BUCKET_NAME + "/*"; //BUCKET_NAME  
readOnlyAnonUserPolicy.Statement[0].Resource[0] = bucketResource;  
  
// Convert policy JSON into string and assign into parameters.  
const bucketPolicyParams = {  
    Bucket: BUCKET_NAME,  
    Policy: JSON.stringify(readOnlyAnonUserPolicy),  
};  
  
export const run = async () => {  
    try {  
        const data = await s3Client.send(  
            new CreateBucketCommand(bucketParams)  
        );  
        console.log('Success, bucket created.', data)  
        try {  
            const response = await s3Client.send(  
                new PutBucketPolicyCommand(bucketPolicyParams)  
            );  
            console.log("Success, permissions added to bucket", response);  
            return response;  
        }  
        catch (err) {  
            console.log("Error adding policy to S3 bucket.", err);  
        }  
    } catch (err) {  
        console.log("Error creating S3 bucket.", err);  
    }  
};  
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).

- For API details, see [PutBucketPolicy](#) in *AWS SDK for JavaScript API Reference*.

## Copy an object from one bucket to another

The following code example shows how to copy an S3 object from one bucket to another.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.  
import { S3Client } from "@aws-sdk/client-s3";  
// Set the AWS Region.  
const REGION = "us-east-1";  
// Create an Amazon S3 service client object.  
const s3Client = new S3Client({ region: REGION });  
export { s3Client };
```

Copy the object.

```
// Get service clients module and commands using ES6 syntax.  
import { CopyObjectCommand } from "@aws-sdk/client-s3";  
import { s3Client } from "./libs/s3Client.js";  
  
// Set the bucket parameters.  
  
export const params = {  
    Bucket: "DESTINATION_BUCKET_NAME",  
    CopySource: "/SOURCE_BUCKET_NAME/OBJECT_NAME",  
    Key: "OBJECT_NAME"  
};  
  
// Create the Amazon S3 bucket.  
export const run = async () => {  
    try {  
        const data = await s3Client.send(new CopyObjectCommand(params));  
        console.log("Success", data);  
        return data; // For unit tests.  
    } catch (err) {  
        console.log("Error", err);  
    }  
};  
run();
```

- For API details, see [CopyObject](#) in *AWS SDK for JavaScript API Reference*.

## Create a bucket

The following code example shows how to create an S3 bucket.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.  
import { S3Client } from "@aws-sdk/client-s3";  
// Set the AWS Region.  
const REGION = "us-east-1";  
// Create an Amazon S3 service client object.  
const s3Client = new S3Client({ region: REGION });  
export { s3Client };
```

Create the bucket.

```
// Get service clients module and commands using ES6 syntax.  
import { CreateBucketCommand } from "@aws-sdk/client-s3";  
import { s3Client } from "./libs/s3Client.js";  
  
// Set the bucket parameters.  
  
export const bucketParams = { Bucket: "BUCKET_NAME" };  
  
// Create the Amazon S3 bucket.  
export const run = async () => {  
    try {  
        const data = await s3Client.send(new CreateBucketCommand(bucketParams));  
        console.log("Success", data);  
        return data; // For unit tests.  
    } catch (err) {  
        console.log("Error", err);  
    }  
};  
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [CreateBucket](#) in [AWS SDK for JavaScript API Reference](#).

## Delete a policy from a bucket

The following code example shows how to delete a policy from an S3 bucket.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.  
import { S3Client } from "@aws-sdk/client-s3";  
// Set the AWS Region.  
const REGION = "us-east-1";  
// Create an Amazon S3 service client object.  
const s3Client = new S3Client({ region: REGION });  
export { s3Client };
```

Delete the bucket policy.

```
// Import required AWS SDK clients and commands for Node.js.
import { DeleteBucketPolicyCommand } from "@aws-sdk/client-s3";
import { s3Client } from "./libs/s3Client.js"; // Helper function that creates an
Amazon S3 service client module.

// Set the bucket parameters
export const bucketParams = { Bucket: "BUCKET_NAME" };

export const run = async () => {
  try {
    const data = await s3Client.send(new DeleteBucketPolicyCommand(bucketParams));
    console.log("Success", data + ", bucket policy deleted");
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
// Invoke run() so these examples run out of the box.
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [DeleteBucketPolicy](#) in [AWS SDK for JavaScript API Reference](#).

## Delete an empty bucket

The following code example shows how to delete an empty S3 bucket.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.
import { S3Client } from "@aws-sdk/client-s3";
// Set the AWS Region.
const REGION = "us-east-1";
// Create an Amazon S3 service client object.
const s3Client = new S3Client({ region: REGION });
export { s3Client };
```

Delete the bucket.

```
// Import required AWS SDK clients and commands for Node.js.
import { DeleteBucketCommand } from "@aws-sdk/client-s3";
import { s3Client } from "./libs/s3Client.js"; // Helper function that creates an
Amazon S3 service client module.

// Set the bucket parameters
export const bucketParams = { Bucket: "BUCKET_NAME" };

export const run = async () => {
  try {
    const data = await s3Client.send(new DeleteBucketCommand(bucketParams));
    return data; // For unit tests.
  }
```

```
        console.log("Success - bucket deleted");
    } catch (err) {
        console.log("Error", err);
    }
};

// Invoke run() so these examples run out of the box.
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [DeleteBucket](#) in [AWS SDK for JavaScript API Reference](#).

## Delete an object

The following code example shows how to delete an S3 object.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.
import { S3Client } from "@aws-sdk/client-s3";
// Set the AWS Region.
const REGION = "us-east-1";
// Create an Amazon S3 service client object.
const s3Client = new S3Client({ region: REGION });
export { s3Client };
```

Delete an object.

```
import { DeleteObjectCommand } from "@aws-sdk/client-s3";
import { s3Client } from "./libs/s3Client.js" // Helper function that creates an Amazon
S3 service client module.

export const bucketParams = { Bucket: "BUCKET_NAME", Key: "KEY" };

export const run = async () => {
    try {
        const data = await s3Client.send(new DeleteObjectCommand(bucketParams));
        console.log("Success. Object deleted.", data);
        return data; // For unit tests.
    } catch (err) {
        console.log("Error", err);
    }
};
run();
```

- For API details, see [DeleteObject](#) in [AWS SDK for JavaScript API Reference](#).

## Delete multiple objects

The following code example shows how to delete multiple objects from an S3 bucket.

## SDK for JavaScript V3

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.  
import { S3Client } from "@aws-sdk/client-s3";  
// Set the AWS Region.  
const REGION = "us-east-1";  
// Create an Amazon S3 service client object.  
const s3Client = new S3Client({ region: REGION });  
export { s3Client };
```

Delete multiple objects.

```
import { DeleteObjectsCommand } from "@aws-sdk/client-s3";  
import { s3Client } from "./libs/s3Client.js" // Helper function that creates an Amazon  
S3 service client module.  
  
export const bucketParams = {  
    Bucket: "BUCKET_NAME",  
    Delete: {  
        Objects: [  
            {  
                Key: "KEY_1",  
            },  
            {  
                Key: "KEY_2",  
            },  
        ],  
    },  
};  
  
export const run = async () => {  
    try {  
        const data = await s3Client.send(new DeleteObjectsCommand(bucketParams));  
        return data; // For unit tests.  
        console.log("Success. Object deleted.");  
    } catch (err) {  
        console.log("Error", err);  
    }  
};  
run();
```

Delete all objects in a bucket.

```
import { ListObjectsCommand, DeleteObjectCommand } from "@aws-sdk/client-s3";  
import { s3Client } from "./libs/s3Client.js"; // Helper function that creates an Amazon  
S3 service client module.  
  
export const bucketParams = { Bucket: "BUCKET_NAME" };  
  
export const run = async () => {  
    try {  
        const data = await s3Client.send(new ListObjectsCommand(bucketParams));  
        let noOfObjects = data.Contents;  
        for (let i = 0; i < noOfObjects.length; i++) {  
            await s3Client.send(  
                new DeleteObjectCommand({  
                    Bucket: "BUCKET_NAME",  
                    Key: data.Contents[i].Key,  
                })  
            );  
        }  
    } catch (err) {  
        console.log("Error", err);  
    }  
};  
run();
```

```
        new DeleteObjectCommand({
          Bucket: bucketParams.Bucket,
          Key: noOfObjects[i].Key,
        })
      );
    }
    console.log("Success. Objects deleted.");
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};

run();
```

- For API details, see [DeleteObjects](#) in *AWS SDK for JavaScript API Reference*.

## Delete the website configuration from a bucket

The following code example shows how to delete the website configuration from an S3 bucket.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.
import { S3Client } from "@aws-sdk/client-s3";
// Set the AWS Region.
const REGION = "us-east-1";
// Create an Amazon S3 service client object.
const s3Client = new S3Client({ region: REGION });
export { s3Client };
```

Delete the website configuration from the bucket.

```
// Import required AWS SDK clients and commands for Node.js.

import { DeleteBucketWebsiteCommand } from "@aws-sdk/client-s3";
import { s3Client } from "./libs/s3Client.js"; // Helper function that creates an
Amazon S3 service client module.

// Create the parameters for calling
export const bucketParams = { Bucket: "BUCKET_NAME" };

export const run = async () => {
  try {
    const data = await s3Client.send(new DeleteBucketWebsiteCommand(bucketParams));
    return data; // For unit tests.
    console.log("Success", data);
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [DeleteBucketWebsite](#) in [AWS SDK for JavaScript API Reference](#).

## Get CORS rules for a bucket

The following code example shows how to get cross-origin resource sharing (CORS) rules for an S3 bucket.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.  
import { S3Client } from "@aws-sdk/client-s3";  
// Set the AWS Region.  
const REGION = "us-east-1";  
// Create an Amazon S3 service client object.  
const s3Client = new S3Client({ region: REGION });  
export { s3Client };
```

Get the CORS policy for the bucket.

```
// Import required AWS SDK clients and commands for Node.js.  
import { GetBucketCorsCommand } from "@aws-sdk/client-s3";  
import { s3Client } from "./libs/s3Client.js"; // Helper function that creates an  
Amazon S3 service client module.  
  
// Create the parameters for calling  
export const bucketParams = { Bucket: "BUCKET_NAME" };  
  
export const run = async () => {  
    try {  
        const data = await s3Client.send(new GetBucketCorsCommand(bucketParams));  
        console.log("Success", JSON.stringify(data.CORSRules));  
        return data; // For unit tests.  
    } catch (err) {  
        console.log("Error", err);  
    }  
};  
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [GetBucketCors](#) in [AWS SDK for JavaScript API Reference](#).

## Get an object from a bucket

The following code example shows how to read data from an object in an S3 bucket.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.  
import { S3Client } from "@aws-sdk/client-s3";  
// Set the AWS Region.  
const REGION = "us-east-1";  
// Create an Amazon S3 service client object.  
const s3Client = new S3Client({ region: REGION });  
export { s3Client };
```

Download the object.

```
// Import required AWS SDK clients and commands for Node.js.  
import { GetObjectCommand } from "@aws-sdk/client-s3";  
import { s3Client } from "./libs/s3Client.js"; // Helper function that creates an  
Amazon S3 service client module.  
  
export const bucketParams = {  
    Bucket: "BUCKET_NAME",  
    Key: "KEY",  
};  
  
export const run = async () => {  
    try {  
        // Get the object} from the Amazon S3 bucket. It is returned as a ReadableStream.  
        const data = await s3Client.send(new GetObjectCommand(bucketParams));  
        // Convert the ReadableStream to a string.  
        return await data.Body.transformToString();  
    } catch (err) {  
        console.log("Error", err);  
    }  
};  
  
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [GetObject](#) in [AWS SDK for JavaScript API Reference](#).

## Get the ACL of a bucket

The following code example shows how to get the access control list (ACL) of an S3 bucket.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.  
import { S3Client } from "@aws-sdk/client-s3";  
// Set the AWS Region.  
const REGION = "us-east-1";  
// Create an Amazon S3 service client object.  
const s3Client = new S3Client({ region: REGION });  
export { s3Client };
```

### Get the ACL permissions.

```
// Import required AWS SDK clients and commands for Node.js.
import { GetBucketAclCommand } from "@aws-sdk/client-s3";
import { s3Client } from "./libs/s3Client.js"; // Helper function that creates an
Amazon S3 service client module.

// Create the parameters.
export const bucketParams = { Bucket: "BUCKET_NAME" };

export const run = async () => {
  try {
    const data = await s3Client.send(new GetBucketAclCommand(bucketParams));
    console.log("Success", data.Grants);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [GetBucketAcl](#) in [AWS SDK for JavaScript API Reference](#).

### Get the policy for a bucket

The following code example shows how to get the policy for an S3 bucket.

#### SDK for JavaScript V3

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.
import { S3Client } from "@aws-sdk/client-s3";
// Set the AWS Region.
const REGION = "us-east-1";
// Create an Amazon S3 service client object.
const s3Client = new S3Client({ region: REGION });
export { s3Client };
```

Get the bucket policy.

```
// Import required AWS SDK clients and commands for Node.js.
import { GetBucketPolicyCommand } from "@aws-sdk/client-s3";
import { s3Client } from "./libs/s3Client.js"; // Helper function that creates an
Amazon S3 service client module.

// Create the parameters for calling
export const bucketParams = { Bucket: "BUCKET_NAME" };

export const run = async () => {
  try {
    const data = await s3Client.send(new GetBucketPolicyCommand(bucketParams));
    console.log("Success", data);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
```

```
    } catch (err) {
      console.log("Error", err);
    }
};

run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [GetBucketPolicy](#) in [AWS SDK for JavaScript API Reference](#).

## Get the website configuration for a bucket

The following code example shows how to get the website configuration for an S3 bucket.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.
import { S3Client } from "@aws-sdk/client-s3";
// Set the AWS Region.
const REGION = "us-east-1";
// Create an Amazon S3 service client object.
const s3Client = new S3Client({ region: REGION });
export { s3Client };
```

Get the website configuration.

```
// Import required AWS SDK clients and commands for Node.js.
import { GetBucketWebsiteCommand } from "@aws-sdk/client-s3";
import { s3Client } from "./libs/s3Client.js"; // Helper function that creates an
Amazon S3 service client module.

// Create the parameters for calling
export const bucketParams = { Bucket: "BUCKET_NAME" };

export const run = async () => {
  try {
    const data = await s3Client.send(new GetBucketWebsiteCommand(bucketParams));
    console.log("Success", data);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For API details, see [GetBucketWebsite](#) in [AWS SDK for JavaScript API Reference](#).

## List buckets

The following code example shows how to list S3 buckets.

## SDK for JavaScript V3

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.  
import { S3Client } from "@aws-sdk/client-s3";  
// Set the AWS Region.  
const REGION = "us-east-1";  
// Create an Amazon S3 service client object.  
const s3Client = new S3Client({ region: REGION });  
export { s3Client };
```

List the buckets.

```
// Import required AWS SDK clients and commands for Node.js.  
import { ListBucketsCommand } from "@aws-sdk/client-s3";  
import { s3Client } from "./libs/s3Client.js"; // Helper function that creates an  
Amazon S3 service client module.  
  
export const run = async () => {  
    try {  
        const data = await s3Client.send(new ListBucketsCommand({}));  
        console.log("Success", data.Buckets);  
        return data; // For unit tests.  
    } catch (err) {  
        console.log("Error", err);  
    }  
};  
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [ListBuckets](#) in [AWS SDK for JavaScript API Reference](#).

## List objects in a bucket

The following code example shows how to list objects in an S3 bucket.

## SDK for JavaScript V3

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.  
import { S3Client } from "@aws-sdk/client-s3";  
// Set the AWS Region.  
const REGION = "us-east-1";  
// Create an Amazon S3 service client object.  
const s3Client = new S3Client({ region: REGION });  
export { s3Client };
```

List the objects.

```
// Import required AWS SDK clients and commands for Node.js.
import { ListObjectsCommand } from "@aws-sdk/client-s3";
import { s3Client } from "./libs/s3Client.js"; // Helper function that creates an
Amazon S3 service client module.

// Create the parameters for the bucket
export const bucketParams = { Bucket: "BUCKET_NAME" };

export const run = async () => {
  try {
    const data = await s3Client.send(new ListObjectsCommand(bucketParams));
    console.log("Success", data);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

List 1000 or more objects.

```
// Import required AWS SDK clients and commands for Node.js.
import { ListObjectsCommand } from "@aws-sdk/client-s3";
import { s3Client } from "./libs/s3Client.js"; // Helper function that creates an
Amazon S3 service client module.

// Create the parameters for the bucket
export const bucketParams = { Bucket: "BUCKET_NAME" };

export async function run() {
  // Declare truncated as a flag that the while loop is based on.
  let truncated = true;
  // Declare a variable to which the key of the last element is assigned to in the
  response.
  let pageMarker;
  // while loop that runs until 'response.truncated' is false.
  while (truncated) {
    try {
      const response = await s3Client.send(new ListObjectsCommand(bucketParams));
      // return response; //For unit tests
      response.Contents.forEach((item) => {
        console.log(item.Key);
      });
      // Log the key of every item in the response to standard output.
      truncated = response.IsTruncated;
      // If truncated is true, assign the key of the last element in the response to
      the pageMarker variable.
      if (truncated) {
        pageMarker = response.Contents.slice(-1)[0].Key;
        // Assign the pageMarker value to bucketParams so that the next iteration
        starts from the new pageMarker.
        bucketParams.Marker = pageMarker;
      }
      // At end of the list, response.truncated is false, and the function exits the
      while loop.
    } catch (err) {
      console.log("Error", err);
      truncated = false;
    }
  }
}
```

```
run();
```

- For API details, see [ListObjects](#) in *AWS SDK for JavaScript API Reference*.

## Set a new ACL for a bucket

The following code example shows how to set a new access control list (ACL) for an S3 bucket.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.  
import { S3Client } from "@aws-sdk/client-s3";  
// Set the AWS Region.  
const REGION = "us-east-1";  
// Create an Amazon S3 service client object.  
const s3Client = new S3Client({ region: REGION });  
export { s3Client };
```

Put the bucket ACL.

```
// Import required AWS SDK clients and commands for Node.js.  
import { PutBucketAclCommand } from "@aws-sdk/client-s3";  
import { s3Client } from "./libs/s3Client.js"; // Helper function that creates an  
Amazon S3 service client module.  
  
// Set the parameters. For more information,  
// see https://docs.aws.amazon.com/AWSJavaScriptSDK/latest/AWS/S3.html#putBucketAcl-property.  
export const bucketParams = {  
  Bucket: "BUCKET_NAME",  
  // 'GrantFullControl' allows grantee the read, write, read ACP, and write ACL  
  // permissions on the bucket.  
  // Use a canonical user ID for an AWS account, formatted as follows:  
  // id=002160194XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXa7a49125274  
  GrantFullControl: "GRANTEE_1",  
  // 'GrantWrite' allows grantee to create, overwrite, and delete any object in the  
  // bucket.  
  // For example, 'uri=http://acs.amazonaws.com/groups/s3/LogDelivery'  
  GrantWrite: "GRANTEE_2",  
};  
  
export const run = async () => {  
  try {  
    const data = await s3Client.send(new PutBucketAclCommand(bucketParams));  
    console.log("Success, permissions added to bucket", data);  
    return data; // For unit tests.  
  } catch (err) {  
    console.log("Error", err);  
  }  
};  
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).

- For API details, see [PutBucketAcl](#) in *AWS SDK for JavaScript API Reference*.

## Set the website configuration for a bucket

The following code example shows how to set the website configuration for an S3 bucket.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.  
import { S3Client } from "@aws-sdk/client-s3";  
// Set the AWS Region.  
const REGION = "us-east-1";  
// Create an Amazon S3 service client object.  
const s3Client = new S3Client({ region: REGION });  
export { s3Client };
```

Set the website configuration.

```
// Import required AWS SDK clients and commands for Node.js.  
import { PutBucketWebsiteCommand } from "@aws-sdk/client-s3";  
import { s3Client } from "./libs/s3Client.js"; // Helper function that creates an  
Amazon S3 service client module.  
  
// Create the parameters for the bucket  
export const bucketParams = { Bucket: "BUCKET_NAME" };  
export const staticHostParams = {  
    Bucket: bucketParams,  
    WebsiteConfiguration: {  
        ErrorDocument: {  
            Key: "",  
        },  
        IndexDocument: {  
            Suffix: "",  
        },  
    },  
};  
  
export const run = async () => {  
    // Insert specified bucket name and index and error documents into parameters JSON  
    // from command line arguments  
    staticHostParams.Bucket = bucketParams;  
    staticHostParams.WebsiteConfiguration.IndexDocument.Suffix = "INDEX_PAGE"; // The  
index document inserted into parameters JSON.  
    staticHostParams.WebsiteConfiguration.ErrorDocument.Key = "ERROR_PAGE"; // The error  
document inserted into parameters JSON.  
    // Set the new website configuration on the selected bucket.  
    try {  
        const data = await s3Client.send(new PutBucketWebsiteCommand(staticHostParams));  
        console.log("Success", data);  
        return data;  
    } catch (err) {  
        console.log("Error", err);  
    }  
};  
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [PutBucketWebsite](#) in [AWS SDK for JavaScript API Reference](#).

## Upload an object to a bucket

The following code example shows how to upload an object to an S3 bucket.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.  
import { S3Client } from "@aws-sdk/client-s3";  
// Set the AWS Region.  
const REGION = "us-east-1";  
// Create an Amazon S3 service client object.  
const s3Client = new S3Client({ region: REGION });  
export { s3Client };
```

Create and upload the object.

```
// Import required AWS SDK clients and commands for Node.js.  
import { PutObjectCommand } from "@aws-sdk/client-s3";  
import { s3Client } from "./libs/s3Client.js"; // Helper function that creates an  
Amazon S3 service client module.  
  
// Set the parameters.  
export const bucketParams = {  
    Bucket: "BUCKET_NAME",  
    // Specify the name of the new object. For example, 'index.html'.  
    // To create a directory for the object, use '/'. For example, 'myApp/package.json'.  
    Key: "OBJECT_NAME",  
    // Content of the new object.  
    Body: "BODY",  
};  
  
// Create and upload the object to the S3 bucket.  
export const run = async () => {  
    try {  
        const data = await s3Client.send(new PutObjectCommand(bucketParams));  
        return data; // For unit tests.  
        console.log(  
            "Successfully uploaded object: " +  
            bucketParams.Bucket +  
            "/" +  
            bucketParams.Key  
        );  
    } catch (err) {  
        console.log("Error", err);  
    }  
};  
run();
```

Upload the object.

```
// Import required AWS SDK clients and commands for Node.js.
import { PutObjectCommand } from "@aws-sdk/client-s3";
import { s3Client } from "./libs/s3Client.js"; // Helper function that creates an
// Amazon S3 service client module.
import {path} from "path";
import {fs} from "fs";

const file = "OBJECT_PATH_AND_NAME"; // Path to and name of object. For example '../
myFiles/index.js'.
const fileStream = fs.createReadStream(file);

// Set the parameters
export const uploadParams = {
  Bucket: "BUCKET_NAME",
  // Add the required 'Key' parameter using the 'path' module.
  Key: path.basename(file),
  // Add the required 'Body' parameter
  Body: fileStream,
};

// Upload file to specified bucket.
export const run = async () => {
  try {
    const data = await s3Client.send(new PutObjectCommand(uploadParams));
    console.log("Success", data);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err);
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [PutObject](#) in [AWS SDK for JavaScript API Reference](#).

## Scenarios

### Create a presigned URL

The following code example shows how to create a presigned URL for S3 and upload an object.

#### SDK for JavaScript V3

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
// Create service client module using ES6 syntax.
import { S3Client } from "@aws-sdk/client-s3";
// Set the AWS Region.
const REGION = "us-east-1";
// Create an Amazon S3 service client object.
const s3Client = new S3Client({ region: REGION });
export { s3Client };
```

Create a presigned URL to upload an object to a bucket.

```
// Import the required AWS SDK clients and commands for Node.js
import {
  CreateBucketCommand,
  DeleteObjectCommand,
  PutObjectCommand,
  DeleteBucketCommand
} from "@aws-sdk/client-s3";
import { s3Client } from "./libs/s3Client.js"; // Helper function that creates an
// Amazon S3 service client module.
import { getSignedUrl } from "@aws-sdk/s3-request-presigner";
import fetch from "node-fetch";

// Set parameters
// Create a random name for the Amazon Simple Storage Service (Amazon S3) bucket and
key
export const bucketParams = {
  Bucket: `test-bucket-${Math.ceil(Math.random() * 10 ** 10)}`,
  Key: `test-object-${Math.ceil(Math.random() * 10 ** 10)}`,
  Body: "BODY"
};
export const run = async () => {
  try {
    // Create an S3 bucket.
    console.log(`Creating bucket ${bucketParams.Bucket}`);
    await s3Client.send(new CreateBucketCommand({ Bucket: bucketParams.Bucket }));
    console.log(`Waiting for "${bucketParams.Bucket}" bucket creation...`);
  } catch (err) {
    console.log("Error creating bucket", err);
  }
  try {
    // Create a command to put the object in the S3 bucket.
    const command = new PutObjectCommand(bucketParams);
    // Create the presigned URL.
    const signedUrl = await getSignedUrl(s3Client, command, {
      expiresIn: 3600,
    });
    console.log(
      `\nPutting "${bucketParams.Key}" using signedUrl with body "${bucketParams.Body}"` +
      " in v3"
    );
    console.log(signedUrl);
    const response = await fetch(signedUrl, {method: 'PUT', body: bucketParams.Body});
    console.log(
      `\nResponse returned by signed URL: ${await response.text()}\n`
    );
  } catch (err) {
    console.log("Error creating presigned URL", err);
  }
  try {
    // Delete the object.
    console.log(`\nDeleting object "${bucketParams.Key}" from bucket`);
    await s3Client.send(
      new DeleteObjectCommand({ Bucket: bucketParams.Bucket, Key: bucketParams.Key })
    );
  } catch (err) {
    console.log("Error deleting object", err);
  }
  try {
    // Delete the S3 bucket.
    console.log(`\nDeleting bucket ${bucketParams.Bucket}`);
    await s3Client.send(
```

```
        new DeleteBucketCommand({ Bucket: bucketParams.Bucket })
    );
} catch (err) {
    console.log("Error deleting bucket", err);
}
};

run();
```

Create a presigned URL to download an object from a bucket.

```
// Import the required AWS SDK clients and commands for Node.js
import {
    CreateBucketCommand,
    PutObjectCommand,
    GetObjectCommand,
    DeleteObjectCommand,
    DeleteBucketCommand
} from "@aws-sdk/client-s3";
import { s3Client } from "./libs/s3Client.js"; // Helper function that creates an
// Amazon S3 service client module.
import { getSignedUrl } from "@aws-sdk/s3-request-presigner";
const fetch = require("node-fetch");

// Set parameters
// Create a random names for the S3 bucket and key.
export const bucketParams = {
    Bucket: `test-bucket-${Math.ceil(Math.random() * 10 ** 10)}`,
    Key: `test-object-${Math.ceil(Math.random() * 10 ** 10)}`,
    Body: "BODY"
};

export const run = async () => {
    // Create an S3 bucket.
    try {
        console.log(`Creating bucket ${bucketParams.Bucket}`);
        const data = await s3Client.send(
            new CreateBucketCommand({ Bucket: bucketParams.Bucket })
        );
        return data; // For unit tests.
        console.log(`Waiting for "${bucketParams.Bucket}" bucket creation...\n`);
    } catch (err) {
        console.log("Error creating bucket", err);
    }
    // Put the object in the S3 bucket.
    try {
        console.log(`Putting object "${bucketParams.Key}" in bucket`);
        const data = await s3Client.send(
            new PutObjectCommand({
                Bucket: bucketParams.Bucket,
                Key: bucketParams.Key,
                Body: bucketParams.Body,
            })
        );
        return data; // For unit tests.
    } catch (err) {
        console.log("Error putting object", err);
    }
    // Create a presigned URL.
    try {
        // Create the command.
        const command = new GetObjectCommand(bucketParams);

        // Create the presigned URL.
        const signedUrl = await getSignedUrl(s3Client, command, {
```

```
        expiresIn: 3600,
    });
    console.log(
        `\nGetting "${bucketParams.Key}" using signedUrl with body "${bucketParams.Body}"`  

    in v3
);
    console.log(signedUrl);
    const response = await fetch(signedUrl);
    console.log(
        `\nResponse returned by signed URL: ${await response.text()}\n`  

    );
} catch (err) {
    console.log("Error creating presigned URL", err);
}
// Delete the object.
try {
    console.log(`\nDeleting object "${bucketParams.Key}" from bucket`);
    const data = await s3Client.send(
        new DeleteObjectCommand({ Bucket: bucketParams.Bucket, Key: bucketParams.Key })
    );
    return data; // For unit tests.
} catch (err) {
    console.log("Error deleting object", err);
}
// Delete the S3 bucket.
try {
    console.log(`\nDeleting bucket ${bucketParams.Bucket}`);
    const data = await s3Client.send(
        new DeleteBucketCommand({ Bucket: bucketParams.Bucket, Key: bucketParams.Key })
    );
    return data; // For unit tests.
} catch (err) {
    console.log("Error deleting object", err);
}
};

run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).

## Get started with buckets and objects

The following code example shows how to:

- Create a bucket.
- Upload a file to the bucket.
- Download an object from a bucket.
- Copy an object to a subfolder in a bucket.
- List the objects in a bucket.
- Delete the objects in a bucket.
- Delete a bucket.

## SDK for JavaScript V3

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
import {
```

```
CreateBucketCommand,
PutObjectCommand,
CopyObjectCommand,
DeleteObjectCommand,
DeleteBucketCommand,
GetObjectCommand
} from "@aws-sdk/client-s3";
import { s3Client } from "../libs/s3Client.js"; // Helper function that creates an
Amazon S3 service client module.

if (process.argv.length < 5) {
    console.log(
        "Usage: node s3_basics.js <the bucket name> <the AWS Region to use> <object name>
<object content>\n" +
        "Example: node s3_basics_full.js test-bucket 'test.txt' 'Test Content'"
    );
}

## S3 Glacier examples using SDK for JavaScript V3

The following code examples show you how to perform actions and implement common scenarios by using the AWS SDK for JavaScript V3 with Amazon S3 Glacier.

*Actions* are code excerpts that show you how to call individual service functions.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

### Topics

## Actions

### Create a vault

The following code example shows how to create an Amazon S3 Glacier vault.

#### SDK for JavaScript V3

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
const { GlacierClient } = require("@aws-sdk/client-glacier");
// Set the AWS Region.
const REGION = "REGION";
//Set the Redshift Service Object
const glacierClient = new GlacierClient({ region: REGION });
export { glacierClient };
```

Create the vault.

```
// Load the SDK for JavaScript
import { CreateVaultCommand } from "@aws-sdk/client-glacier";
import { glacierClient } from "./libs/glacierClient.js";

// Set the parameters
const vaultname = "VAULT_NAME"; // VAULT_NAME
const params = { vaultName: vaultname };

const run = async () => {
  try {
    const data = await glacierClient.send(new CreateVaultCommand(params));
    console.log("Success, vault created!");
    return data; // For unit tests.
  } catch (err) {
    console.log("Error");
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [CreateVault](#) in [AWS SDK for JavaScript API Reference](#).

#### SDK for JavaScript V2

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
// Load the SDK for JavaScript
```

```
var AWS = require('aws-sdk');
// Set the region
AWS.config.update({region: 'REGION'});

// Create a new service object
var glacier = new AWS.Glacier({apiVersion: '2012-06-01'});
// Call Glacier to create the vault
glacier.createVault({vaultName: 'YOUR_VAULT_NAME'}, function(err) {
    if (!err) {
        console.log("Created vault!")
    }
});
```

- For API details, see [CreateVault](#) in [AWS SDK for JavaScript API Reference](#).

## Upload an archive to a vault

The following code example shows how to upload an archive to an Amazon S3 Glacier vault.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client.

```
const { GlacierClient } = require("@aws-sdk/client-glacier");
// Set the AWS Region.
const REGION = "REGION";
//Set the Redshift Service Object
const glacierClient = new GlacierClient({ region: REGION });
export { glacierClient };
```

Upload the archive.

```
// Load the SDK for JavaScript
import { UploadArchiveCommand } from "@aws-sdk/client-glacier";
import { glacierClient } from "./libs/glacierClient.js";

// Set the parameters
const vaultname = "VAULT_NAME"; // VAULT_NAME

// Create a new service object and buffer
const buffer = new Buffer.alloc(2.5 * 1024 * 1024); // 2.5MB buffer
const params = { vaultName: vaultname, body: buffer };

const run = async () => {
    try {
        const data = await glacierClient.send(new UploadArchiveCommand(params));
        console.log("Archive ID", data.archiveId);
        return data; // For unit tests.
    } catch (err) {
        console.log("Error uploading archive!", err);
    }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).

### Check whether a phone number is opted out

The following code example shows how to check whether a phone number is opted out of receiving Amazon SNS messages.

#### SDK for JavaScript V3

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { SNSClient } from "@aws-sdk/client-sns";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SNS service object.
const snsClient = new SNSClient({ region: REGION });
export { snsClient };
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import {CheckIfPhoneNumberIsOptedOutCommand } from "@aws-sdk/client-sns";
```

```
import {snsClient } from "./libs/snsClient.js";

// Set the parameters
const params = { phoneNumber: "353861230764" }; //PHONE_NUMBER, in the E.164 phone
number structure

const run = async () => {
  try {
    const data = await snsClient.send(
      new CheckIfPhoneNumberIsOptedOutCommand(params)
    );
    console.log("Success.", data);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err.stack);
  }
};

run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [CheckIfPhoneNumberIsOptedOut](#) in [AWS SDK for JavaScript API Reference](#).

### Confirm an endpoint owner wants to receive messages

The following code example shows how to confirm the owner of an endpoint wants to receive Amazon SNS messages by validating the token sent to the endpoint by an earlier Subscribe action.

#### SDK for JavaScript V3

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { SNSClient } from "@aws-sdk/client-sns";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SNS service object.
const snsClient = new SNSClient({ region: REGION });
export { snsClient };
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import {ConfirmSubscriptionCommand } from "@aws-sdk/client-sns";
import {snsClient } from "./libs/snsClient.js";

// Set the parameters
const params = {
  Token: "TOKEN", // Required. Token sent to the endpoint by an earlier Subscribe
  action. */
  TopicArn: "TOPIC_ARN", // Required
  AuthenticateOnUnsubscribe: "true", // 'true' or 'false'
};

const run = async () => {
  try {
    const data = await snsClient.send(new ConfirmSubscriptionCommand(params));
```

```
        console.log("Success.", data);
        return data; // For unit tests.
    } catch (err) {
        console.log("Error", err.stack);
    }
};

run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [ConfirmSubscription](#) in [AWS SDK for JavaScript API Reference](#).

## Create a topic

The following code example shows how to create an Amazon SNS topic.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { SNSClient } from "@aws-sdk/client-sns";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SNS service object.
const snsClient = new SNSClient({ region: REGION });
export { snsClient };
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import {CreateTopicCommand} from "@aws-sdk/client-sns";
import {snsClient} from "./libs/snsClient.js";

// Set the parameters
const params = { Name: "TOPIC_NAME" }; //TOPIC_NAME

const run = async () => {
    try {
        const data = await snsClient.send(new CreateTopicCommand(params));
        console.log("Success.", data);
        return data; // For unit tests.
    } catch (err) {
        console.log("Error", err.stack);
    }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [CreateTopic](#) in [AWS SDK for JavaScript API Reference](#).

## Delete a subscription

The following code example shows how to delete an Amazon SNS subscription.

## SDK for JavaScript V3

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { SNSClient } from "@aws-sdk/client-sns";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SNS service object.
const snsClient = new SNSClient({ region: REGION });
export { snsClient };
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import {UnsubscribeCommand } from "@aws-sdk/client-sns";
import {snsClient } from "./libs/snsClient.js";

// Set the parameters
const params = { SubscriptionArn: "TOPIC_SUBSCRIPTION_ARN" }; //TOPIC_SUBSCRIPTION_ARN

const run = async () => {
  try {
    const data = await snsClient.send(new UnsubscribeCommand(params));
    console.log("Success.", data);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err.stack);
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [Unsubscribe](#) in [AWS SDK for JavaScript API Reference](#).

## Delete a topic

The following code example shows how to delete an Amazon SNS topic and all subscriptions to that topic.

## SDK for JavaScript V3

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { SNSClient } from "@aws-sdk/client-sns";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SNS service object.
const snsClient = new SNSClient({ region: REGION });
export { snsClient };
```

Import the SDK and client modules and call the API.

```
// Load the AWS SDK for Node.js

// Import required AWS SDK clients and commands for Node.js
import {DeleteTopicCommand} from "@aws-sdk/client-sns";
import {snsClient} from "./libs/snsClient.js";

// Set the parameters
const params = { TopicArn: "TOPIC_ARN" }; //TOPIC_ARN

const run = async () => {
  try {
    const data = await snsClient.send(new DeleteTopicCommand(params));
    console.log("Success.", data);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err.stack);
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [DeleteTopic](#) in [AWS SDK for JavaScript API Reference](#).

## Get the properties of a topic

The following code example shows how to get the properties of an Amazon SNS topic.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { SNSClient } from "@aws-sdk/client-sns";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SNS service object.
const snsClient = new SNSClient({ region: REGION });
export { snsClient };
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import {GetTopicAttributesCommand} from "@aws-sdk/client-sns";
import {snsClient} from "./libs/snsClient.js";

// Set the parameters
const params = { TopicArn: "TOPIC_ARN" }; // TOPIC_ARN

const run = async () => {
  try {
    const data = await snsClient.send(new GetTopicAttributesCommand(params));
    console.log("Success.", data);
    return data; // For unit tests.
  } catch (err) {
    console.error("Error", err.stack);
  }
};
run();
```

```
    } catch (err) {
      console.log("Error", err.stack);
    }
  };
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [GetTopicAttributes](#) in [AWS SDK for JavaScript API Reference](#).

### SDK for JavaScript V2

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Import the SDK and client modules and call the API.

```
// Load the AWS SDK for Node.js
var AWS = require('aws-sdk');
// Set region
AWS.config.update({region: 'REGION'});

// Create promise and SNS service object
var getTopicAttrbsPromise = new AWS.SNS({apiVersion:
  '2010-03-31'}).getTopicAttributes({TopicArn: 'TOPIC_ARN'}).promise();

// Handle promise's fulfilled/rejected states
getTopicAttrbsPromise.then(
  function(data) {
    console.log(data);
  }).catch(
  function(err) {
    console.error(err, err.stack);
});
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [GetTopicAttributes](#) in [AWS SDK for JavaScript API Reference](#).

### Get the settings for sending SMS messages

The following code example shows how to get the settings for sending Amazon SNS SMS messages.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { SNSClient } from "@aws-sdk/client-sns";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SNS service object.
const snsClient = new SNSClient({ region: REGION });
export { snsClient };
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import {GetSMSAttributesCommand } from "@aws-sdk/client-sns";
import {snsClient } from "./libs/snsClient.js";

// Set the parameters
var params = {
  attributes: [
    "DefaultSMSType",
    "ATTRIBUTE_NAME",
    /* more items */
  ],
};

const run = async () => {
  try {
    const data = await snsClient.send(new GetSMSAttributesCommand(params));
    console.log("Success.", data);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err.stack);
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [GetSMSAttributes in AWS SDK for JavaScript API Reference](#).

## List the subscribers of a topic

The following code example shows how to retrieve the list of subscribers of an Amazon SNS topic.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { SNSClient } from "@aws-sdk/client-sns";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SNS service object.
const snsClient = new SNSClient({ region: REGION });
export { snsClient };
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import {ListSubscriptionsByTopicCommand } from "@aws-sdk/client-sns";
import {snsClient } from "./libs/snsClient.js";

// Set the parameters
const params = { TopicArn: "TOPIC_ARN" }; //TOPIC_ARN

const run = async () => {
```

```
try {
  const data = await snsClient.send(new ListSubscriptionsByTopicCommand(params));
  console.log("Success.", data);
  return data; // For unit tests.
} catch (err) {
  console.log("Error", err.stack);
}
};

run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [ListSubscriptions](#) in [AWS SDK for JavaScript API Reference](#).

## List topics

The following code example shows how to list Amazon SNS topics.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { SNSClient } from "@aws-sdk/client-sns";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SNS service object.
const snsClient = new SNSClient({ region: REGION });
export { snsClient };
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import {ListTopicsCommand} from "@aws-sdk/client-sns";
import {snsClient} from "./libs/snsClient.js";

const run = async () => {
  try {
    const data = await snsClient.send(new ListTopicsCommand([]));
    console.log("Success.", data);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err.stack);
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [ListTopics](#) in [AWS SDK for JavaScript API Reference](#).

## Publish to a topic

The following code example shows how to publish messages to an Amazon SNS topic.

## SDK for JavaScript V3

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { SNSClient } from "@aws-sdk/client-sns";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SNS service object.
const snsClient = new SNSClient({ region: REGION });
export { snsClient };
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import {PublishCommand} from "@aws-sdk/client-sns";
import {snsClient} from "./libs/snsClient.js";

// Set the parameters
var params = {
  Message: "MESSAGE_TEXT", // MESSAGE_TEXT
  TopicArn: "TOPIC_ARN", //TOPIC_ARN
};

const run = async () => {
  try {
    const data = await snsClient.send(new PublishCommand(params));
    console.log("Success.", data);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err.stack);
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [Publish](#) in [AWS SDK for JavaScript API Reference](#).

## Set the default settings for sending SMS messages

The following code example shows how to set the default settings for sending SMS messages using Amazon SNS.

## SDK for JavaScript V3

### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { SNSClient } from "@aws-sdk/client-sns";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SNS service object.
```

```
const snsClient = new SNSClient({ region: REGION });
export { snsClient };
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import {SetSMSAttributesCommand} from "@aws-sdk/client-sns";
import {snsClient} from "./libs/snsClient.js";

// Set the parameters
const params = {
  attributes: {
    /* required */
    DefaultSMSType: "Transactional" /* highest reliability */,
    //DefaultSMSType: 'Promotional' /* lowest cost */
  },
};

const run = async () => {
  try {
    const data = await snsClient.send(new SetSMSAttributesCommand(params));
    console.log("Success.", data);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err.stack);
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [SetSmsAttributes](#) in [AWS SDK for JavaScript API Reference](#).

## Set topic attributes

The following code example shows how to set Amazon SNS topic attributes.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { SNSClient } from "@aws-sdk/client-sns";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SNS service object.
const snsClient = new SNSClient({ region: REGION });
export { snsClient };
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import {SetTopicAttributesCommand} from "@aws-sdk/client-sns";
```

```
import {snsClient} from "./libs/snsClient.js";

// Set the parameters
const params = {
  AttributeName: "ATTRIBUTE_NAME", // ATTRIBUTE_NAME
  TopicArn: "TOPIC_ARN", // TOPIC_ARN
  AttributeValue: "NEW_ATTRIBUTE_VALUE", //NEW_ATTRIBUTE_VALUE
};

const run = async () => {
  try {
    const data = await snsClient.send(new SetTopicAttributesCommand(params));
    console.log("Success.", data);
    return data; // For unit tests.
  } catch (err) {
    console.log("Error", err.stack);
  }
};
run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [SetTopicAttributes](#) in [AWS SDK for JavaScript API Reference](#).

### Subscribe a Lambda function to a topic

The following code example shows how to subscribe a Lambda function so it receives notifications from an Amazon SNS topic.

#### SDK for JavaScript V3

##### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { SNSClient } from "@aws-sdk/client-sns";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SNS service object.
const snsClient = new SNSClient({ region: REGION });
export { snsClient };
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import {SubscribeCommand} from "@aws-sdk/client-sns";
import {snsClient} from "./libs/snsClient.js";

// Set the parameters
const params = {
  Protocol: "lambda" /* required */,
  TopicArn: "TOPIC_ARN", //TOPIC_ARN
  Endpoint: "LAMBDA_FUNCTION_ARN", //LAMBDA_FUNCTION_ARN
};

const run = async () => {
  try {
    const data = await snsClient.send(new SubscribeCommand(params));
```

```
        console.log("Success.", data);
        return data; // For unit tests.
    } catch (err) {
        console.log("Error", err.stack);
    }
};

run();
```

- For more information, see [AWS SDK for JavaScript Developer Guide](#).
- For API details, see [Subscribe](#) in [AWS SDK for JavaScript API Reference](#).

## Subscribe a mobile application to a topic

The following code example shows how to subscribe a mobile application endpoint so it receives notifications from an Amazon SNS topic.

### SDK for JavaScript V3

#### Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Create the client in a separate module and export it.

```
import { SNSClient } from "@aws-sdk/client-sns";
// Set the AWS Region.
const REGION = "REGION"; //e.g. "us-east-1"
// Create SNS service object.
const snsClient = new SNSClient({ region: REGION });
export { snsClient };
```

Import the SDK and client modules and call the API.

```
// Import required AWS SDK clients and commands for Node.js
import {SubscribeCommand} from "@aws-sdk/client-sns";
import {snsClient} from "./libs/snsClient.js";

// Set the parameters
const params = {
    Protocol: "application" /* required */,
    TopicArn: "TOPIC_ARN", //TOPIC_ARN
    Endpoint: "MOBILE_ENDPOINT_ARN", // MOBILE_ENDPOINT_ARN
};

const run = async () => {
    try {
